INDEX

CANADIAN MINING JOURNAL: Vol. 29.

Abitibi Lake District, by M. R. Baker, 509.
Abitibi Lake District, 486.
Abitti Mining Co., 154.
Abrasures, Infusorial Earth, Uses of, 606.
Abrasive Materials in the U. S., 444.
Abrasive Products, Grinding Wheels, etc., 209-10.
Acadia Coal Co., 606a.
Acadia Powder Co., 577.
Accident at Norton Hill Colliery, 308.
Accidents, Ambulance Work in Mine, 245.
Accidents, Coal Mine, Their Causes and Prevention, 626.
Accidents in British Columbia Mines, 299.
Accidents in Nova Scotia Mines, 280.
Accidents, Mine, Prevention of, 222.
Adler, H. G. V., on "Concerning the Profession of Mining Engineering," 614; on Cobalt Ore Treatment, 655.
Adulteration of Paris Green, 485.
Advertising, Clean, 130.
Afforestation in South Wales, 544.
Air Compressors, Portable, The Use of, by Frank C. Perkins, *268-69.
Alberta, Annual Report of the Department on Coal Mines, *425-27.
Alberta Coal Lands, 2, 632-33, 668-69.
Alberta Coal Mines Regulations Act, 122.
Alberta Coal and Coke Co., 669.
Alberta Fuel Co., 669.
Alberta Government Examination for Mine Managers, 427-30.
Alberta, Labor Troubles in Coal Mines, 695-96, 698.
Alberta, Mineral Resources, A Bibliography of, by J. C. Gwillim, 210-11.
Alberta Railway and Irrigation Co., 251, 314, 633.
Alberta, Special Correspondence, 632, 668, 695, 27, 54, 87, 218, 251, 280, 314, 379.
Albert Manufacturing Co., 121.
Algoma Steel Co., 480.
Alliance Gold and Copper Mining Co., 185.
Aluminium and Some of Its Uses, by J. T. W. Echevarri, 627a-630a.
Aluminium, 530-32.
Apex Property, 480.
Amalgamated Copper Co., 91, 125.
American Foundrymen's Association, Standard Methods for the Analysis of Iron, 660.
American Petroleum Co., 284.
American Smelting and Refining Co., 30, 484.
Amparo Mining Co., 544.
Anglo-Mexican Mining and Exp. Co., 157.
Antimony, Output of United States, 488.
Antimony Pigments, 691.
Aranyl Molybdate, 691.
Arlington Mine, 512, 543.
Arsenic in Ores, A Rapid Method for the Estimation of, 75-76.
Asbestos Deposits of the Urals, 125, 382.
Asbestos-fibre Shingles, 569.
Asbestos in Quebec, 229, 344, 461.
Asbestos, Russian, 583a.
Asbestos Wood, Its Use and Qualities, 663a.
Ashworth, John, 436.
Ashworth, James and John, on The Present Position of the Coal Dust Problem, 558-60.
Asphalt in the Caucasus, 698.
Assaying, A Textbook of, Reviewed by H. E. T. Haultain, 305-07.
Assay of Silver Ores, The, by W. K. McNeill, 112.
Atikoken Iron Co., by L. B. Orchard, *36-40.
Atikoken Iron Co., 187, 480, 623.
Atlin Consolidated Gold Mining Co., 636.
Atlin, Hydraulic Operations, 639a.
Aurora Mine, 606a.
Australia, Mineral Output, 91.
Australia, Western, Report of Mining for 1907, *492-96.

Babine Lake Properties, 606a.
Badger Mine, 25, 58, 87, 154.
Baker, Manley B., 247; on Abitibi Lake District, 508-09.
Baldwin, C. Remble, 51.
Banking, Canadian, 584a, 616a.
Barrateros Mine in Mexico, 285.
Barrett Manufacturing Co., 64.
Bastin, Edson S., on Quartz and Feldspar, 169-72.
Bauxite in France, 111.
Bear Lake Copper Mines, 448.
Beatty, M., & Sons, a Large Canadian Plant, *180-81.
Beatson Copper Mine, 382.
Beaufort Tinplate Works, 670.
Beaver Consolidated Mining Co., 34, 119, 441.
Beaver Superior Mining Co., 28.
Behrend Dry Concentrator for All Ores, *142-43.
Bell, Dr. Robert, 228.
Bell, J. M., on the Great Waihi Mine, *388-93, 420-24.
Bell Asbestos Mining Co., 352.
Belmont Iron Mines, 544.
Benito Juarez Co., 317.
Bennie, P. McN., on Grondell Process of Concentrating and Briquetting Iron Ores, *332-35.
Bevington, R. G., President of C. M. & M. Society of S. Africa, Inaugural Address, 497-99, 529-30.
Big Bend Mica Co., 186.
Blackwell, George G., 474.
Blast Furnaces, The Economic Distribution of Electric Power From, by B. H. Thwaite, 624-25.
Blasting Explosives, Safety, 601a.
Blaylock, S. G., 22, 57.
Blue Bell Mine, 187, 409, 698, 667a.
Blue Bird Mine, 26, 185, 219, 252, 408, 511.
Boards of Trade of Eastern B. C., Resolutions Passed, 18.
Bolling, Randolph, on A Canadian Method for the Technical Determination of Silicon in Pig Iron, *69-70; on The Technical Analysis of Magnetite, Hematite and Limonite, 363-65.
Bolton, Frederick, 50.
Bombshell Ore, The Origin of, by H. M. Chance, 402-03.
Bonanza Creek Gold Mining Co., Two Estimates, 66-67.
Bonanza Creek Mines, Their Value, 2.
Bannington Falls, Visit of C. M. I., 504.
Book Reviews, 627, 690, 62, 49, 150, 182, 274, 305, 341, 374, 403, 434, 473, 504, 536, 569, 601, 633a.
Boston Richardson Mine, 410, 416, 418, 445, 461, 638a.
Boundary Mines, 89.
Bounties on Iron Ore, 616a.
Bounties on Lead Extended, 258.
Bounties on Petroleum, 348.
Bounties Paid on Iron and Steel in 1907, 158.
Bovey, Dr. Henry T., 51.
Brennan, C. V., the Oldham Gold Mine, 509.
Brooklyn Mine, 381.
Breathing Apparatus, Its Advantage Shown, 486, 604a.
Breathing Apparatus, by Prof. Leonard Hill, *262-65,
Breathing Apparatus, Oxygen, The Use of, at the Sydney Mines Fre, by F. W. Gray, 487-88.
British-Canadian Asbestos Co., 345.
British Columbia Coal and Coke Tax, 3-4.
British Columbia Coal Tax, 35.
British Columbia Copper Co., 92, 155, *251-52, 253, 283, 315, 408, 513, 448, 480, 512, 616a, 647a, 668a.
British Columbia, Mineral on Moresby Island, 236-38.
British Columbia, Mineral Production of, by E. Jacobs, 683-84.
British Columbia, Mineral Production of, in 1907, by E. Jacobs, 648.
British Columbia, Official Bulletins, 162.
British Columbia, Placer Mining Act, 90.
British Columbia, report of Provincial Mineralogist, *1907. 1
British Columbia, Special Correspondence, 633, 696, 26, 56, 89, 154, 185, 219, 251, 315, 345, 380, 407, 447, 479, 511, 542, 576, 605a, 607a, 667a.
British Columbia University, 33, 98.
British Mines Inspectors, Reports of, for 1907, 328.
British Mining Enterprise in Mexico, 285.
Briquetting, Coal, in 1907, by Edward W. Parker, 530-32.
Briquetting in Germany, 513.
Briquetting of Fuels in British Columbia, by G. J. Mashek, *661-64, 685-87.
Brock, R. W., The Lardeau District, 587-89.
Brough, Bennett H., 571.
Broughton Advertising Co., 161.
Brown, E. Percy, on The Treatment of Stamp Mill Tailings at the Richardson Mine, Goldboro, N.S., 444; on How Can the Gold Industry of Nova Scotia be Assisted? 172-73.
Brown, M. Walter, 630.
Brownell-Granger Co., 22.
Brumell, H. P. B., on Modes of Occurrence of Canadian Graphite, 39-42.
Bruce Mines, 577, 637a.
Burchell Coal Area, 441.
Buckingham Graphite Co.'s Mill Described, 14-15.
Buffalo Mine, 315, 640, 667, 609a, 641a, 670a.
Bullion-Beck Co., 609a.
Bullion King Co., 30.
Burchell, Herbert C., 215.
Bureau of Mines Proposed for the United States, 11-14.
Byron S. White Co., 629, 668a.

Cadmium, Electroplating With, 681.
Cages, Hoisting, A New Safety Device for, *166-67.
Calgary Mine Operators and Workers, 58.
Callena Mines of Spain, 481.
Calumet and Hecla Co., 91, 484.
Canada, as a Dumping Ground for U. S. Coal, 666a.
Canada Corundum Co., 638, 638a.
Canada Iron Corporation, 581, 636a, 669a.
Canada, Northern, Development of, by J. B. Tyrrell, 612-614.
Canadian Operating Mining Companies, List of, 437-43.
Canada West Coal Co., 281.
Canadian Creek Mine, 58.
Canadian Exhibit at Franco-British Exhibition, *468-69.
Canadian Girl Claim, 409.
Canadian Metal Co., 668a-69a.
Canadian Mining Co., 195.
Canadian Mining Institute, 1, 2, 34, 51, 65, *67-68, 215, 244, 260, 274, 321, 328, 331-32, 369, 419, 455, 478, 571, 560-67, 674, *679-80, 627, 694, 626a, 639a.
Canadian Place Names, 535.
Canadian Zinc Co., 29, 90, 94-5, 252, 544, 606a.
Cantley, C. L., on Coal Washing as Practised at Sydney Mines, *525-29.
Casey Cobalt Co., 154, 250.
Cara Brea Tin Mines, 670.
Cariboo Consolidated Hydraulic Co., 284.
Cariboo, Gold Yield in 1907, 669.
Cariboo Mines, Guggenheim, 449.
Cars, A Novel Coupling for Mining, *171-72.
Cape Breton Coal, 2.
Cape Breton, Its Mines and Climate, 445.
Cape Breton Disaster, 54.
Cape Breton, Coal Mining in, During 1907, 652-54.
Cape Breton Coal Resources, 477.
Cape Copper Co., 254.
Centre Star Mine, 156, 252, 282, 447, 511, 698, 637a, 667a.
Cement from Slag, 635a.
Cement Pillars for Mine Timbers, 222.
Century Mine, 314.
Cerro de Pasco Copper Co., 126.
Chambers-Ferland Mine, 218, 250, 289-90, 301-62, 316, 478, 575, 638a.
Cherry Creek Co., 629.
China, a Market for Silver and Copper, 486.
China-clay, Its Nature and Origin, 633a.
Chisholm, Minnesota, Destroyed by Fire, 481.
Chrome Iron Mining in Canada, by H. F. Strangways, *42-47.
City Deep Shaft on the Rand, 221.
City of Cobalt Co., 25, 87, 154, 218, 314, 320, 478, 541, 572, 578, 632, 695, 670a.
Cleaning Ores Wanted in New South Wales, 146.
Claims, Mining, Inspection in Ontario, 151.
Claims, Discovery and Location, 486.
Claims, Discovery Before Location, 322.
Claims, Discovery Before Location, by W. Thos Newman, 324-25.
Cleveland Cobalt Mine, 29.
Cleave, A. H. W., on Ottawa Mint, *100-103.
Cleveland Cobalt Mine, 154, 613.
Climate of Klondike, The, 130.
Coking and Steaming Properties, 379.
Coal Along the Crow's Nest Pass, 668.
Coal at Big Marsh, N.S., 697.
Coal and Asphalt in Oklahoma, 125.
Coal and Steel, Battle Between Nova Scotia Companies, 320.
Coal Combine in Japan, 59.
Coal Bituminous, in Northern Cariboo, 668.
Coal, Boring in P. E. Island, 381.
Coal, British Columbia a Market in Mexico, 291.
Coal, British Trade in, 681.
Coal, Briquetting of Fuels in British Columbia, by G. J. Mashek, *661-64.
Coal Briquetting in 1907, by Edward W. Parker, 530-32.
Coal Cargo, The Largest Shipped, *576-78.
Coal Cutters in British Collieries, 161.
Coal-cutting Machines in the United Kingdom, 636.
Coal, Conditions in Nova Scotia, 57.
Coal Dust Problem, The Present Position of, by James and John Ashworth, 558-60.
Coal Washing as Practised in the U. S. S. & I. Co., by C. L. Cantley, *525-29.
Coal Drilling Machinery, 104.
Coal Dust, Danger of, 634.
Coal Dust Problem, Dr. Oliver's Views, 634.
Coal Dust Question, 441.
Coal Eight Hours for Miners in Alberta, 668.
Coal Fields in Austria Hungary, 699.

Coal Importers of France Organizing, 637.
Coal in Australia, 221.
Coal in Austria-Hungary, 254, 670.
Coal in Cape Breton, Sulphur Question, 2, 477.
Coal in Chili, 412.
Coal in Crow's Nest Pass, 696-97.
Coal in Germany, 577.
Coal in India, 640a.
Coal in Indiana, 670a.
Coal in Mexico, 544.
Coal in Nicola Valley, 696.
Coal in North Alberta, 218.
Coal in New Zealand, 544.
Coal in Queensland and Victoria,,125, 411, 640a.
Coal in Queensland, 411.
Coal in Russia, 544, 607a.
Coal in Saskatchewan, 123, 821.
Coal in Siberia, 91.
Coal in Spitzbergen, 350.
Coal in Wales, 513.
Coal in Yorkshire, 221.
Coal in the Yukon, 537.
Coal Lands in Alberta, 2.
Coal, Lignite Used on Railway, 668.
Coals, Low Grade Classification, 179.
Coal Mine Accidents, Their Causes and Prevention, 626.
Coal Mine Fatalities, 610.
Coal Miners and the Newspapers, 290.
Coal Mines, Alberta, 632-33.
Coal Mines, Accidents in Germany, 29.
Coal Mine Sampling, Uniform and Systematic, 456.
Coal Mines, A School for Rescue Work in, *327-28.
Coal Mines, Explosions, 22.
Coal Mines of Alberta, Annual Report of the Department, *425-27.
Coal Mines of Ohio, 569.
Coal Mines, Ownership by Railways in Indiana Prohibited, 91.
Coal Mines Regulations Act of Alberta, 122.
Coal Mining, Contract Price at Bankhead, 314.
Coal Mining, Death Rate in U. S. Mines, 488.
Coal Mining in New South Wales, 637.
Coal Mining in the United States in 1907, 20.
Coal Mining in Cape Breton During 1907, 652-54.
Coal, Mining Machine for Low Veins, *277-79.
Coal, Mining Operations of the Dominion Coal Co., by F. W. Gray, *57.
Coal Mining, Submarine, by John Johnston, 135-36.
Coal, Miners, Wages in New Brunswick, 667.
Coal, Moisture in, 167.
Coal, Operations in Germany, 59.
Coal, Operations of Nova Scotia C. & S. Co., 672.
Coal, Output of Alberta, 88.
Coal, Output of British Columbia, 1907, 298.
Coal, Output of South Wales, 157.
Coal, Output of Transvaal, 30.
Coal, Output of the World, 1906, 674a.
Coal, Output in United Kingdom, 127-28, 187, 317, 319, 411.
Coal Production in Europe and America, 636.
Coal Production in Greece, 637.
Coal, Production in India, 59.
Coal, Production in Nova Scotia, 638.
Coal, Rescue Apparatus in Scotland, 693.
Coal Resources of Queensland, 637.
Coals, Classification of, by the Split Volatile Ratio, by D. B. Dowling, *143-46.
Coal, Safety Measures in Mines, 192.
Coal-Steel Case in Nova Scotia, 697.
Coal, Submarine Leases Bill in Nova Scotia, 186.
Coal, Submarine Mines in Nova Scotia, 446.
Coal, Tax in British Columbia, 27, 57.
Coal Tests in Queensland, 699.
Coal, the F. C. Caldwell Case, 88.
Coal, the Rhondda Seam Struck, 382.
Coal, The Weathering of, 664.
Coal, Trade Expanding in Britain, 698.
Coal Trade, St. Lawrence, 194.
Coal Trade in South America, 699.
Coal-washing Plant, 607a.
Cobalt and Nickel, The Determination of, by W. K. McNeil, 272-73.
Cobalt and the Globe, 518.
Cobalt, Boom in Mining Stocks, 582a, 613a.
Cobalt Central, 250, 253, 575, 695.
Cobalt District for Year 1907, Report on, by Arthur A. Cole, *168-71.
Cobalt Dividend Payers, 447.
Cobalt, Didivends by Various Companies, 382.
Cobalt, Double Hand-drilling Contest, 407.
Cobalt Lake Mine, 25, 28, 30, 60, 87, 313, 348, 635, 695.
Cobalt, Leasing System of, 574.
Cobalt Central Mine, 25.
Cobalt Man in a Dilemma—Mind and Matter, 556, 566, 632a.
Cobalt Majestic Co., 667.
Cobalt Merchants' M. & M. Co., 695.
Cobalt Mines, Equipment of, a detailed statement of machinery installed, 106-07.
Cobalt, Ore Product in the Various Mines, 1907, 668.
Cobalt Ores, Concentrating, by G. H. Gillespie, 103-106.
Cobalt Ores, by W. K. McNeil, 617-18.
Cobalt Ore Treatment, by H. G. V. Adler, *655.
Cobalt, Present and Future, *194, 200-203.
Cobalt Region, Ores and Rocks of the, by R. E. Hore, 300.
Cobalt, Report on, for 1907, 162.
Cobalt, Sale of Railway Lands, 577.
Cobalt, Shipments of Ore for Six Months, 1908, 414.
Cobba-Sexton Mining Co., 667.
Cobalt Silver Deposits, Inspired News, 674.
Cobalt Silver Queen Co., 670a.
Cobalt Stocks, Boom in the Market, 454-55.
Cobalt, Thefts of High-grade Ore, 227.
Cobalt, the Price of Silver, 569.
Cobalt Townsite Mining Co., 700, 642a.
Cobalt, Visit of C. M. I., *502-03, 562.
Cobalt, Wage Scale, 142.
Cobalt, "66" Camp, 217.
Cochrane-Cobalt Co., 541, 576.
Coeur d'Alene Mining District, 635a.
Cokemaking in Virginia, 433.
Coke, Moisture in, 519.
Coke, Production at Connellsville, 516.
Cole, Athur A., Report on Cobalt District for 1907, *168-71.
Coleman Cobalt Co., 510.
Coleman Miners' Union Resolutions, 27.
Coleman Properties, 218.
Coleman Township, Inspection of Claims no Longer Required, 695.
Coll, C. J., on Some Recent Explosions in Coal mines, 146.
Collieries, a New Safeguard, 99.
Collieries of the Prussian Government, 205.
Collieries of Vancouver Island, 387.
Colonial Mine, 154, 184.
Colorado Group, 605a.
Columbus Cobalt Mine, 576.
Companies Incorporated in Cobalt and Larder Districts, 58.
Companies, Mining, List of Canadian Operating, 437-43.
Companies, Provincially Incorporated, Status of, 610.
Company Reports, 30, 60-2, 92, 128, 188-90, 222, 285, 515, 545, 578, 700, 607a, 641a, 670a.
Compensation Act, Alberta, Discussion of, 87-88.
Compensation, Workmen's, in Nova Scotia, 86.
Concentrating Cobalt Ores, by G. H. Gillespie, *103-106.
Concentrating Plant of Boston Consolidated Co., 634a.
Concentration, Methods of, at Cobalt, by Geo. E. Sanston, 458-61.
Concentration, Elmore Process, 253, 513.
Concentration of Cobalt Ores, 99.
Concentration, Vanner Tests, 399.
Concentrator, Behrend Dry, for All Ores, *342-43.
Concentrator, Dry, Test, 569.
Concentrator, Northern Customs, 575.
Conciliation Board in Nova Scotia, 86.
Concrete Foundations, Reinforced, for Stamp batteries, *586-89a.
Company Stores, 54.
Coniagas Mines, 25, 87, 154, 284, 314, 511, 375 632, 646a.
Coombs, Frederick Norton, 51.
Copper, at Parry Sound, 449.
Copper, Annual Production of Canada and U. S. 320.
Copper Cliff, Examination of Well Water, by J. W. Rawlins, 687-88.
Copper Cliff Properties, 635, 695.
Copper Cliff, Visit of C. M. I., 562.
Copper, Consumption in Germany, 31.
Copper, Cost of World's Supply, 403.
Copper, Discovery Near Zambesi, 671.
Copper Fields of Nevada, 22.
Copper in Australia, 157, 544.
Copper in Bulgaria, 699.
Copper Industry in Butte District, 637.
Copper in Quebec, 229.
Copper in Russia, 513.
Copper in Tasmania, 544.
Copper in the Yukon, 411.
Copper, Market Value of, 214
Copper, Official Reports of Cost of Porducing, 506.
Copper Ore, Low Grade, Treatment of, by James Parkes, 49.
Copper Ores of Sudbury-Soo District, by J. C. Gwillim, 680.
Copper, Output of Arigonza, 640a.
Copper, Output of British Columbia, 1907, 298.
Copper, Output of Michigan, 644a.
Copper, Output of Montana, 317, 644a.
Copper, Output of Principal Copper-producing Countries, 450.
Copper, Production of Arizona, 157.
Copper, Production of the United States, 1906, Review, 48.
Copper, Production of the World, 191-92.
Copper, Production of Montana, 350.
Copper, Production of Norway, 221.
Copper, Production of Ural, 125
Copper Queen Co., 30.
Copper River and N.-W. Railway, 254.
Copper Smelters, Laboratory Routine in Modern, by H. T. Waller, 621a, 626a.
Copper, Stock in England and France, 638.
Copper, White Horse Properties, 639a.
Corbin, D. C., 697.
Corporations and Politics, 519.
Cost of Mining at Joplin, 214.
Costs of Mining and Milling in S. Africa, —
Coupling for Mine Cars, A Novel, *171-72.
Cowboy Coal Areas, 635.
Cow Bay Coal Areas, 635.
Crawford v. Lawson Mine, 348.
Cragg Claims, 479.
Crescent Mines, 56, 89, 90, 252.
Cripple Creek Output, 59.
Crown Coal and Coke Co., 27, 30.
Croesus Gold Mining and Milling Co., 604a
Crown Reserve Mine, 154, 184, 250, 314, 319, 378, 446, 546, 636a, 671a.
Crow's Nest Coal Co., 28, 31, 93, 124, 158, 187, 221, 281, 288, 315, 382, 387, 410, 412, 700, 704.
Crystal Gold Mine, 284.
Crystal Stamp Mill, 669a.
Cumberland Railway and Coal Co., 352.
Cunningham, Dave, 317.
Cyanidation of Silver Ores at Pachuca, 537.
Cyanide Practice at Pachuca, 570.
Cyanide, Bromo-cyaniding of Gold Ores, 661a.
Cyanide Treatment, Settling Slimes in, 534.
Cyaniding at Cripple Creek, 213.

Danziger, Jos. L., 660a.
Davis, Harold P., on The Montreal River District, *132-35.
Davis Silver Cobalt Co., 511, 543, 575, 576.
Death Rate Among United States Coal Miners, 488.
De Beers Consilidated Mines, 59, 411, 544, 640.
De Kalb, Courtenay, 162.

Sullivan Electric Coal Cutters

For Low Coal

Sullivan "Low Vein" Room and Pillar Coal Mining Machine, Class "CE-6," on Self-Propelling Truck

The Sullivan Electric Chain Coal Mining Machine, for Low Vein Room and Pillar mines, makes a continuous cut across the whole face or breast, without withdrawing the cutter bar from the coal, without hand barring or changing of jacks, and without moving roof props.

It requires only 5 feet and 3 inches of space in front of the coal for its operation, it stands 51 inches high while cutting, and 56 inches on its self-propelling truck. This machine shows, in actual work, a cutting efficiency 50 to 200 per cent. in excess of any ordinary chain breast cutter. It may be used with safety under weak roofs, since the props may be permanently set one-half as far from the face, as is required by the latter machine.

A Low Vein Long Wall Machine of the same pattern is also manufactured.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

R. G. DRINNEN, Superintendent. **G. G. S. LINDSEY,** General Manager.

HUNTING TRIPS

THERE is no Railroad in America, probably in the world, that can bring Sportsmen within touch of so many famous haunts of big and small game as can the Canadian Pacific. From the lordly Moose of Nova Scotia and New Brunswick to the Bear and Mountain Goat of the Rockies is a far cry but it is C.P.R. all the way, traversing en route hundreds of miles of ideal hunting country.

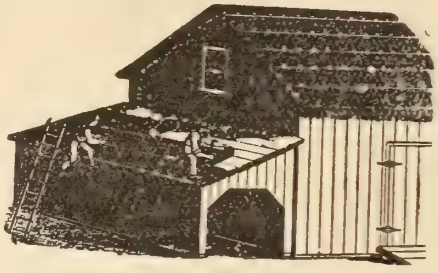
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

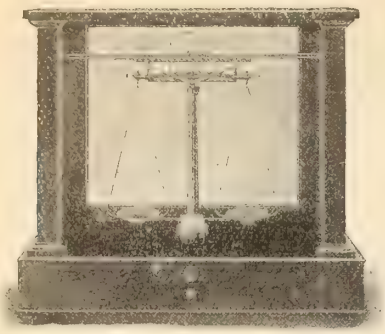
Leading Features of a Good Rock Drill

No. 6.—Rand Adjustable Tripod



THE RAND TRIPOD combines flexibility and wide range of adjustment with great strength and rigidity, adapting it to rough surfaces. No other tripod has the wide range of adjustment obtained with the Rand. In fact *all drill makers have changed the design of their drills to make them fit the Rand Tripod.*

The adjustable clamp permits of changing drills from column to tripod, or vice versa, without disconnecting the feed screw or changing bolts.

Great Turnstile, London, England

McGill University

MONTREAL

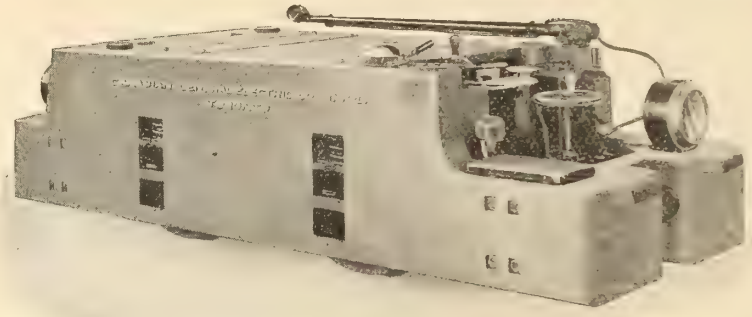
The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.



Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

THE SIXTEENTH ANNUAL REPORT OF THE ONTARIO BUREAU OF MINES.

This report, noticed at length on other pages of this issue, is a clean and creditable volume. The first part only has appeared so far. The second part, a revision up to date of Dr. Miller's Cobalt pamphlet, accompanied by a new geological contour map of Coleman, is yet in the press. Perusal of Part I. induces several conclusions. Most important of these is the conviction that the Bureau of Mines is overworked and undermanned. Ontario is a magnificently large country. In her northern areas travel and transportation are beset with difficulties. Mineral industries of many kinds and of all degrees of importance and promise are spread all over the Province. In three years Ontario's mineral production has increased by 67 per cent.

It is therefore not inappropriate to suggest that this almost startling growth demands a corresponding expansion of the Bureau of Mines.

The present officials of the Department of men of long experience, of unquestioned trustworthiness, and of more than provincial reputation. Under the Hon. Mr. Cochrane's administration of the Department, a vigorous advertising campaign has been instituted. It is due to this policy that English capital, in large amounts, has been invested and is now being placed in the Cobalt district. In Deputy Minister Gibson the Province has a servant whose unremitting industry and intelligent zeal are fully appreciated only by those who happen to know the magnitude of his labors. Dr. W. G. Miller, the Provincial Geologist, ranks with the most distinguished scientists of the continent. Of the other members of the Bureau's staff it is enough to say that they are thoroughly imbued with the spirit of enthusiam and loyalty that marks their superiors. The whole staff works together in a manner as creditable as it is unusual.

But neither efficiency nor industry can accomplish the impossible. The work is rapidly assuming proportions far beyond the Bureau's capacity.

We therefore would respectfully impress upon the Provincial Government the present need of strengthening and assisting the Department of Mines.

There are several directions in which expansion can be recommended.

The summer classes, conducted in the mining camps for the benefit of prospectors and others, could be enlarged and, in some districts, made permanent.

The duties of the Provincial Geologist and of the Deputy Minister should be lightened. Much of their time is now wasted on official minutiae, which could be looked after by cheaper men.

The system of inspection should be expanded. It is hardly possible that one official can keep a paternal eye upon all the mines of Ontario. In fact the attempt of one man to cover all the Province implies the waste of a disproportionately large amount of time in travelling. Hence, some arrangement that would give the present inspector the power of appointing local assistant inspectors for the more important mining districts should be considered.

These are a few, possibly quite enough, of the improvements that present conditions and the promise of the immediate future demand.

THE STATUS OF PROVINCIALLY INCORPORATED COMPANIES.

A decision of considerable importance in its bearing upon the powers of mining and other companies organized under Provincial charters of incorporation was given by the Supreme Court of Canada on December 13th in the appeal case of the Canadian Pacific Railway Company vs. the Ottawa Fire Insurance Company. The case involved several technical issues, the point raised in connection with the appeal being the right of a company chartered by the Province of Ontario to do business outside of its boundaries. At the trial both the Dominion Government and the leading Provinces were repreesnted by counsel, the Department of Justice upholding the contention of the plaintiffs, that Provincially incorporated companies must confine their operations to the Provinces from which they hold charters. By a majority of four to two the Supreme Court overruled this view and dismissed the appeal, thereby establishing the right of Provincial companies to do an extra-Provincial business. It is fortunate for the mining interests of the country that this conclusion was reached, as otherwise the great majority of the mining companies that are operating under Provincial charters, would have been under the necessity of becoming reincorporated at Ottawa, and their business would have been subjected to great confusion owing to the raising of questions as to validity of contracts, etc. The effect abroad of such a limitation as was sought to be imposed would have been exceedingly damaging. The loss to the Province of Ontario in annual revenue by forcing companies to take out Federal instead of Provincial charters would have been about $200,000.

COAL MINE FATALITIES.

One of our Nova Scotian correspondents, Mr. F. W. Gray, has described, in former issues of THE CANADIAN MINING JOURNAL, the introduction of modern rescue apparatus in the collieries of the Dominion Coal Company.

Three terrible coal mine disasters have taken place in the United States within the past month. These might never have occurred had proper precautionary measures been taken.

But as a sad object lesson they must be given deep consideration by Canadians. Canada's coal mining industry is expanding rapidly. The right time to meet the situation is now. It is surely unnecessary to wait until tragedies in our own mines have lent sad emphasis to our responsibilities as a nation.

Nor should this work be left to the humane enterprise of private corporations. As pointed out before, the Dominion Coal Company has availed itself of the latest and best experience and has spared neither time nor money in providing for the safety of its workmen. But, if a private corporation is enlightened enough to recognize its duty, it all the more strongly accentuates the fact that upon the nation as a whole rests the final responsibility.

Neither industrial power, nor political prestige is as important as human life. It were better for Canada to remain forever stationary than by indifference or lust of power to sanction the slaughter of her citizens.

The recognition and investigation of questions such as this, questions vital and immediate, involving the safety of thousands of our fellow-citizens, might most properly engage the attention of the Mines Branch of the Federal Department of Mines.

There would then be no need of duplicating in any respect the work of the Geological Survey.

A UNITED STATES BUREAU OF MINES.

President Roosevelt in his message to the Congress of the United States recommended the creation of a Bureau of Mines.

Commenting upon this, the *Mining and Scientific Press* sounds a note of warning. "It is proposed," says the *Press*, "to put the Bureau of Mines in the Department of the Interior, and this suggests the recognition of geological primogeniture. In any event, we hope that in the effort to make a new departure of uncertain value, nothing will be done calculated to impair the usefulness of an established organization of such unquestioned help to mining development as the Geological Survey. Let us have a Bureau, or a Department of Mines, as may seem best, but let it not further emasculate a technological body, the products of which have been honor to the American application of science to industry."

These sentiments apply aptly to the situation in Ottawa. Miserably regrettable conditions will be sure to follow the lopping off of any of the functions of the Geological Survey.

LEGAL DEFINITIONS OF "MINERAL" AND "ORE" IN THE UNITED STATES.

This is the title of an interesting chapter in an interesting book, reviewed on another page of this issue.

Definitions of the words "mineral," "ores," etc., have been variously affected and effected under the common

law and State statutes, under the Federal mining and land laws and under the United States customs laws.

The meanings of the words "minerals" and "ores" have been fruitful sources of litigation. From the famous case of Hartwell vs. Cammon, decided in New Jersey in 1854, arose the dictum that it is not necessary for a substance to contain a metal to be embraced within the term "mineral."

It is now a settled legal principle in the United States that petroleum and natural gas are "minerals." In conveyances and contracts they are comprised in that term. But for a long time this point was unsettled. In fact at one time the Pennsylvania Supreme Court decided that, since in popular estimation petroleum is not regarded as a mineral substance, therefore in all contracts the view of the mass of mankind should hold. This view did not long obtain.

Coal always has occupied a well-defined place as a mineral. The question of its inclusion in mineral grants and reservations has rarely been a cause of dispute. But, curiously enough, iron pyrites mixed with the coal, if brought to the surface and separated from the coal, belongs to the owner of the land, who can recover the value of the pyrites at such place "less the cost of mining the same and separating it from the coal."

Water, though strictly a mineral, is not included by the law under that term. Clays, of all varieties, considered in England as minerals, have not been legally classified in the United States.

The legal definition of the word "mineral," when used in deeds, leases or other legal instruments in the United States, may be summarized as follows:—

"In the absence of special provisions, it includes all metallic minerals of sufficient value to justify mining and extracting the same, whether for the purpose of reducing the metal therefrom or some other industrial use. It also includes rock used for building material, etc., coal, petroleum and natural gas."

The word "ore" has been legally defined as designating a compound of metal and other substances—a loose and quite valueless definition. Better is this description: An ore is a mineral or mineralized rock than can be profitably mined.

Editorial Notes.

With the December 5th issue of the *Mining Reporter* the name and style of our Denver contemporary will be changed. The two periodicals, the *Mining Reporter* and *Ores and Metals,* have been consolidated . Hereafter, under the name of *Mining Science* the new weekly will appear. The Canadian Mining Journal offers its congratulations and good wishes.

In this issue of The Canadian Mining Journal the whole text of Mr. Brock's report on Larder Lake is reprinted. This has been considered advisable for two reasons—firstly, because the report is one of major importance and of public interest; secondly, because it is so succinct and compressed that further condensing would be unfair to its author.

INDUSTRIAL EDUCATION.

W. L. Goodwin.

There is one aspect of this important subject which should receive the most careful consideration at the hands of our educational experts. An ever-increasing number of industries are conducted on a scientific basis which demands not only carefully educated managers, but also that the workmen and foremen shall be intelligent, acute and interested in their work through knowing the meaning of it. In the past these matters have been left to adjust themselves; but, with the keen competition and rapid improvements in processes so characteristic of the times, there has come the necessity for more methodical preparation for the life-work of the industrial rank and file. There are a number of directions in which progress can be made in Canada. The public schools may be so related to the industries prevailing in the district as to form a natural road not only to "the three R's," but to intelligent and effective production. The combination classes which are a feature of the Ontario public school system may be extended into the evening so as to keep up the educative process for a few years for those boys and girls whose circumstances make it necessary for them to begin wage earning at a comparatively early age. Doubtless evening schools have a limited value, but, with the shorter hours of work now prevailing, it is possible for bright lads to put in a few hours a week in study without overstrain. This is the right time to give careful consideration to such a subject. Our manufacturing industries are expanding rapidly, and calling insistently for a better supply of skilled labor. It would be hard to find better material for this supply than our Canadian youth, if they are given the opportunities for education which are open to the boys and girls in Germany, France, England, and other countries of the old world. Mr. Eustace Carey, in a recent presidential address to the Society of Chemical Industry, said in this connection: "So keenly do many manufacturers of my acquaintance feel as to the desirability of the continuation classes that they have made it a condition of employment when engaging boys that they shall attend a certain number of evening classes during the winter, the employers, of course, in these cases paying the fees." His reference is to the evening continuation classes of the technical schools. We commend this subject to the Manufacturers' Association.

Mr. Eugene Coste has returned to Toronto from a visit to Winnipeg and Vancouver and many intermediate points.

DEVELOPMENT OF NORTHERN CANADA.*

J. B. Tyrrell.

Northern Canada as here referred to is a title doubtless fairly well understood by all as defining that portion of Canada which lies north of the more thickly settled parts of the Provinces of Quebec, Ontario, Manitoba, Saskatchewan, Alberta and British Columbia, and which forms a great land mass stretching for 85 degrees of longitude across the centre of the North Temperate Zone in the Western Hemisphere. It is a country so vast that even those of us who have made a special study of it know little about it, except that its immensity and its vastness so completely overshadow all its other attributes in the mind of the traveller that he has great difficulty in descending to thoughts of the common details of existence, such as surround us in our daily life under ordinary conditions of civilization.

You have all heard the saying many times of late that last century was marked by the great progress of the United States; but that the progress and opening up of Canada will be the distinguishing features of this century.

On the 1st of January, 1901, the first day of this century, in the City of Dawson, during the almost sunless days of a very cold winter, spent within four degrees of the Arctic Circle, and surrounded by that advance guard of adventurous miners, thrown out into one of the coldest and least accessible parts of our northern country, I published a letter in the Dawson *Daily News*, in which that idea of faith in the coming progress and development of Canada was enunciated. Whether it had been stated before or not I do not know, but the idea had impressed itself upon me that while during the past century the United States had become fabulously rich by seizing and making use of its great natural resources, that now the conquest of our own north country had begun in earnest.

Dawson was but an outpost from which civilization would radiate into the surrounding wilderness, and it was but one of many centres which would soon be established by the enterprise of our people. The greatest extent of virgin territory in the world lies in Canada, and before the close of this century we will have learned how to make use of the vast store of natural resources of even the most inhospitable parts of the country.

Let us for a moment consider the value of the products of the whole of Canada at the present time. It is not my intention to weary you with figures and statistics. Any of you can look these up in the census reports for yourselves; but a few figures may be instructive. The total value of the natural products of Canada in 1901 was in round figures $519,000,000. Of this sum the agricultural and farm products were valued at $393,000,000; the forest products came next with a value of $51,000,000, while the mineral products were worth $48,000,000. Five years before that date, namely, in 1896, the minerals produced had only a value of $20,000,000; while five years later, in 1906, they had reached the large total of $80,000,000. Thus farming is as yet by far our most important industry. But mining has assumed a place second to it and is increasing rapidly every year.

Now with regard to Northern Canada, many of you here present will acknowledge that you know very little about it; but at the same time most of you will claim a fairly accurate knowledge of the industries of the Province of Ontario. This Province is considered one of the most fertile parts of the North American Continent, with its fields of yellow grain, its orchards loaded with golden fruit, and its splendid stock farms replete with the vitality and energy bred of the Canadian air. You are quite certain of this fact. You have seen it all as you have travelled over the land from Cornwall in the East to Windsor in the West. It is true that the parts of Ontario immediately around us are fertile and well cultivated, but the cultivated lands comprise only about one-seventh part of the whole Province, and form a fringe along its southern side. The remaining six-sevenths of its area, which lies further north, is as yet almost undeveloped and hardly comes into your thoughts when you are considering the Province as a whole.

New or Northern Ontario is as yet practically an unbroken and untilled wilderness, except that it has to a considerable extent been stripped of the richest portion of its natural crop, namely, of its forests of white pine. These pine forests, the natural growth of the unbroken soil, yielded many large fortunes to those who had the good judgment to secure them. Fortunes will still be made from the products of the forest; but in our northern country the forest growth is very slow, so that when the land is found capable of being used for other purposes the forest must needs give way. For instance, we now know that in Northern Ontario, near the Height of Land, between the watersheds of the Great Lakes and Hudson's Bay, there is an area of 25,000 square miles of rich clay land, which is eminently suited to the growth of all the more hardy cereals. Judging from the similarity of the vegetation on this forest area in Northern Ontario to the vegetation in the wooded regions of Manitoba, Saskatchewan, and Alberta, where the best wheat in the world is grown, I am confidently of the opinion that this great clay belt of the north, with its 16,000,000 acres of rich land, will, when cleared and drained, be the wheat-growing region of Eastern America, and that the wheat that it will grow will be No. 1 hard. This statement, that there is within this Province, within a day's journey of us, land now lying waste which is capable of producing 150,000,000 bushels of hard wheat every year, may seem hardly credible; but such seems to me to be the case. The model farms which the Government will shortly establish in that region will prove the value of this land, and the character of the crops which can be raised to the greatest advantage, whether these crops are wheat or some other grain. This land is one of the assets of Canada, and its cultivation and use will be one of the reasons why this century will belong to Canada.

I might speak for the whole evening of the vast areas of fertile land as yet uncultivated, that lie between the western border of this Province and the Pacific Ocean, the largest areas of rich unbroken agricultural land in the world. But you have heard of that Western country very often of late, and so anything that I might say here would be tiresome and uninteresting. Only those of you who have travelled through it and have seen it can begin to comprehend its possibilities. We all, however, feel certain of the great agricultural development that is in store for Canada.

My purpose in coming before you to-night was not to dilate on Canada's agricultural greatness. Around and beyond the agricultural land are vast stretches of rocky country, which are not suited to the needs of the farmer.

*A paper read before the Canadian Institute.

Parts of this country will probably be kept for the growth of forest, for the time is at hand when trees will be grown systematically and carefully by the foresters, just as hay and grain are now grown by the farmers, and probably the cultivated forests will grow far larger crops of trees than evey grew in the natural forest. But still the development and progress of very much of Northern Canada will depend not so much on what it produces from the surface upwards, but on the valuable minerals that will be dug by miners from beneath the surface.

Now the figures quoted above indicate to some extent the value of what has already been done in the way of unlocking this great treasure house of nature and taking out the ores and metals that are so necessary to the welfare of mankind. Last year ores and metals to the value of $80,000,000 were recovered. Ten years ago the mineral production of Canada had a value of $20,000,000—a very satisfactory increase in the time.

But let us look at the record of the mining industry in the United States. In the year 1905 the mineral products of the United States had a value of $1,623,000,000, or about twenty-one times as much as the production of Canada in the following year. This gigantic figure should make us very modest in talking about our present mining enterprises, and it shows us what we must attain to if we are to claim this century as in any way belonging to us. I believe we can produce as much as the figure last stated before the close of this century, but you can see that Canada must advance with tremendous strides in the discovery and development of her mineral resources if she is to attain to any such results, and such results are quite unattainable unless the people of this country take a far more general interest in mining than they are doing at the present time.

Probably one-half of the whole of Canada is limited to minerals and ores for the production of its wealth, and consequently its national progress depends to a very large extent on the discovery and development of these sources of wealth. Such being the case, it becomes the duty of all good Canadians to take an intelligent interest in mining affairs. Possibly some of you may say that you do take a great interest in mining, that you own so many shares in such and such mining companies, and that you are much interested in the market value of your stocks. Whether the mine will ever pay back the capital invested in it, whether it is producing an adequate quantity of ore to enable it to pay good dividends on what you paid for the stock, or whether the property has to rely entirely on the verbosity and persuasive powers of the brokers to give it a value, you perhaps do not know or do not care as long as the market holds up until you have disposed of your stock at a handsome profit. Now, gentlemen, I wish to tell you that in such cases you are not acting as the friends of the mining industry at all. You are introducing into what should be considered an industrial enterprise the worst methods of the real estate agent. In many cases you are piling up on that enterprise a financial burden greater than it is able to bear, and it will sink in consequence. If you wish to be a true friend of the mining industry and—considering its vital importance to the welfare of the country—every honest-hearted Canadian must wish to be ranked among its friends, you should devote a certain reasonable amount of time to the study and investigation of the conditions under which the mining industry is carried on, by reading standard books on mining and on the modes of the occurrence of ore deposits, and by including among the magazines which you regularly glance over each week or each month one or more that treat especially of mining. No one in this city can urge the excuse that such magazines are not available, for their is here published one of the brightest and most informing mining journals on the continent, one that deals strictly with Canadian affairs, and that is full of good reliable information about the mines of Canada.

This is a matter which affects the welfare of the country, not only to-day and to-morrow, but for centuries to come, and for this century at least much of the progress will depend on the children of to-day. It is therefore your duty and the general duty of the people of Canada to see to it that the children know something of the great heritage of mineral wealth that is awaiting them, of the ways in which it is being worked, and of some of the possibilities for its future extension. For this purpose the readers in use in the public schools should be revised, and a number of articles should be included which would be descriptive of the mines and mineral industries of Canada, with brief and interesting accounts of their discoveries, growth and progress up to their present conditions. An account of the discovery of nickel at Sudbury and the growth of the nickel industry up to its present enormous prportions would make a most interesting and instructive story; and the history of Silver Islet, that little rock lving out in Lake Superior, should be made known to all the children of this Province. Accounts of many romantic incidents might be chosen from the lives of prospectors who have travelled in canoes and on foot with packs on their backs through the northern forest, in discovering the deposits of ore from which the metals, so necessary to the welfare of mankind, can be extracted. All such accounts might be made very interesting, and, at the same time, they would furnish instruction which would become part of the mental equipment of the men and women of the future.

The Canadian Mining Journal should also be placed in the schools, and the older students should be encouraged to read it, as in many cases they would take more interest in accounts of incidents that were transpiring at the present time, and which possibly their parents might be talking about at home than in matters of history. Lessons such as these would be quite as entertaining and far more instructive than most of the lessons that are now read in the schools, and the boys and girls, both old and young, would be taught to know something of the mines which have already been discovered and the mining and smelting work that is now being performed in Canada. Thus from their earliest years the children would know that mining is an integral part of the life of Canada; they would have given it a permanent place in their mental landscape, and consequently would be able to think of it more intelligently and study it more easily in after life.

In view of the enormous importance of mining in the future life and progress of the Dominion, it is certainly not too much to require that some knowledge of it should form part of the education of all our children, and the beginnings of that education can be most easily imparted through the school readers. I trust that very soon not only Ontario, but all the other Provinces of the Dominion will see to it that the children are taught something about the mines and mining possibilities of Canada, and to that end will incorporate in their school readers interesting and accurate accounts of their mines and ore deposits.

Besides educating the children in the public and high schools on some of the elementary principles of mining and of the laws that govern the occurrence of ore deposits, lectures on mining should be given to the people generally throughout the country, not so much in the

mining communities themselves as in cities and towns, for the people must necessarily spread from the towns into the wilderness, and the towns in turn will be beneficially affected by the additional trade developed as more new country is opened up or as country already settled becomes more thickly populated. In addition to such lectures, which would be mostly delivered in winter, the summer schools regularly conducted by the universities and the higher seats of learning should be open not only to those who are anxious to take advantage of them and who intend to devote their lives to the business of mining, but to all who can be induced to attend in order that as many as possible should learn something of the industry which is to be the main source of wealth of so large a part of the Dominion. In such ways as these the people might be taught something about the character of the ores that the country is producing or is likely to produce, and of the many ways in which those ores are mined and reduced to commercial products for the use of mankind, and they would consequently be able to consider more intelligently any mining schemes which might be placed before them. We would not then hear so many stories about men having found silver at Cobalt years ago and not knowing what it was; or, on the other hand, about people spending large sums of money in buying properties stated by unprincipled parties to contain mineral wealth but which have no value whatever. Ignorance of the first principles of mining makes it possible for such men to sell to the people worthless stocks in so-called mining companies and interests which they would never have bought if they had been in a position to know their value. The money that has thus been wasted in the past 12 months would more than pay for the improvements in education here suggested for the next 20 years.

I would also suggest that both the Dominion and Provincial Governments be asked to introduce and establish Information Bureaus, perhaps in connection with their Geological Surveys, from which information would be freely distributed as to the character of the different parts of the north country or routes of travel through it, the character of the rocks that might be met with in any part of the district, the significance of those rocks from a miner's standpoint and what useful minerals are to be looked for in them. Let this Bureau collect information from the geologists, engineers, surveyors and others who have travelled over and explored the country and put it in such form that it will be accessible and interesting to the general public, and particularly to persons who may wish to visit any particular locality. The Government might also make arrangements with the railroads, or possibly the railroads, if asked, would themselves agree to grant fares at very low rates to students and prospectors who might wish to visit the mining districts or to go out prospecting into any parts of the north country where ores are likely to be found, and in this way great numbers of young men who necessarily take holidays from their regular occupations for a few weeks each year might be induced to spend their holidays in searching for ore deposits somewhere up in the north country instead of hooking harmless little fish or shooting beautiful wild birds and animals. Make prospecting fashionable and popular like fishing and hunting and you will see at once a very rapid increase in the knowledge of the resources of the north country. Such fares as are here suggested are now given by the railroads to homeseekers who wish to inspect the agricultural lands in the West, and surely they might be given with more reason to men who are willing to endeavor to open up the much less inviting and rocky country of the north.

In addition to such tickets, prizes might be given to the men who would bring in the best collections of minerals each year. In this way many useful minerals might be discovered, many new localities for other minerals might be made known, and the students and prospectors would be given a very great incentive in their search for minerals and ores. To start this matter at once, I will here offer a prize of $100 for the best collection of minerals made in the Province of Ontario next summer, and the collections to be judged by the Professors of Mineralogy at Toronto and Queen's University, if they will accept the charge. The full particulars of this prize will be stated later after consultation with these professors. I trust that other men will also offer prizes, so that possibly they might be divided up for different sections of the country.

Now Mr. President, ladies and gentlemen, I wish strongly to impress upon you the fact that the mining industry must be the staple industry for very large portions both of this Province and the Dominion. The Government that holds the control of that great northern country in trust for the benefit and welfare of the people should see to it that the country is developed along the best possible lines, and for the greatest benefit of the people, both by teaching the children mining in the schools through the medium of the school readers, and the older people by popular lectures on mining and summer classes. In this way it could enlist the sympathies of the whole people and build up a sound mining sentiment.

An Information Bureau should be established which would collect and systematize the knowledge that is now stored away in Government reports and other places not easily accessible or attractive to the people and presented to the people in interesting and readable form.

The people should be induced by cheap railroad fares, prizes, etc., to visit the north country for themselves to see its mines and to spend some of their holidays in trying to find its mineral and ore deposits.

Northern Canada is part of the Dominion, and Canadians cannot get rid of the responsibility that rests on them for its proper development.

CONCERNING THE PROFESSION OF MINING ENGINEERING.

H. G. V. Adler.

The Canadian Mining Journal deserves the thanks of all interested in mining for the work it has done in exposing the fraudulent practices of certain company promoters. In connection with this movement there has been considerable discussion as to the status and reliability of many alleged mining engineers. This is not a new question. It has been considered and dealt with in most countries where mining is extensively developed.

In the United States the policy followed is that of the open door, and I am unable to speak from experience of its working. But I judge, from the position taken by my friends from that side, that it has not proved satisfactory.

In South Africa and Australia, on the other hand, the hall mark of the mining engineer is the membership of the Institute of Mining and Metallurgy, and that membership is reserved for the technical and practical man who can give the Institute proofs as to his honesty and ability, and for whom any member of the Institute will stand sponsor.

In addition to this the Governments of the Transvaal and of the Australian States safeguard the mining industry and the lives of the workmen by certificating mine managers and underground managers. No person not holding a certificate can operate a mine. This is enforced by fine or imprisonment.

In Australia there is an examining board, consisting usually of the Chief Inspector of Mines a mining inspector and a boiler or machinery inspector. This board considers applications for examination, which must be accompanied by proofs and records of mining and underground work. If satisfied with the length of experience shown, the board will examine the applicants and issue certificates to those who pass the tests.

In addition to a knowledge of the actual working of mines and familiarity with machinery commonly used, a rough knowledge of field geology and compass surveying is necessary, as well as a good working acquaintance with the mining acts and regulations.

In the Transvaal the test is much more severe. The board consists of a chairman—the State Mining Engineer—one mining inspector and one boiler inspector appointed by the Government, and one member each chosen by the Chamber of Mines and the Mine Managers' Association. Proofs of seven years' actual mining work have to be given (graduates of certain mining schools are remitted two years of this term), before the candidate is allowed to sit for examination. The examination is oral and is conceded by all those who have submitted to it to the most searching test of mining knowledge yet instituted.

I believe that if the Ontario Government will add to their Mines Act a provision for the examination and certificating of mine managers that it will result in enormons benefit to the State. I would suggest that all mines employing over 20 men be required to employ a certificated manager, and that all mines employing more than 100 men be required to have certificated underground managers as well.

Such a step will help in pointing a way to the formation of an Institute of Mining Engineers that will protect the honest and able engineer and the public from the depredations of the "Mike MacDonalds," who are always at the service of the "Laws" and "Russells."

MINERS' CLUBS.

F. W. Gray.

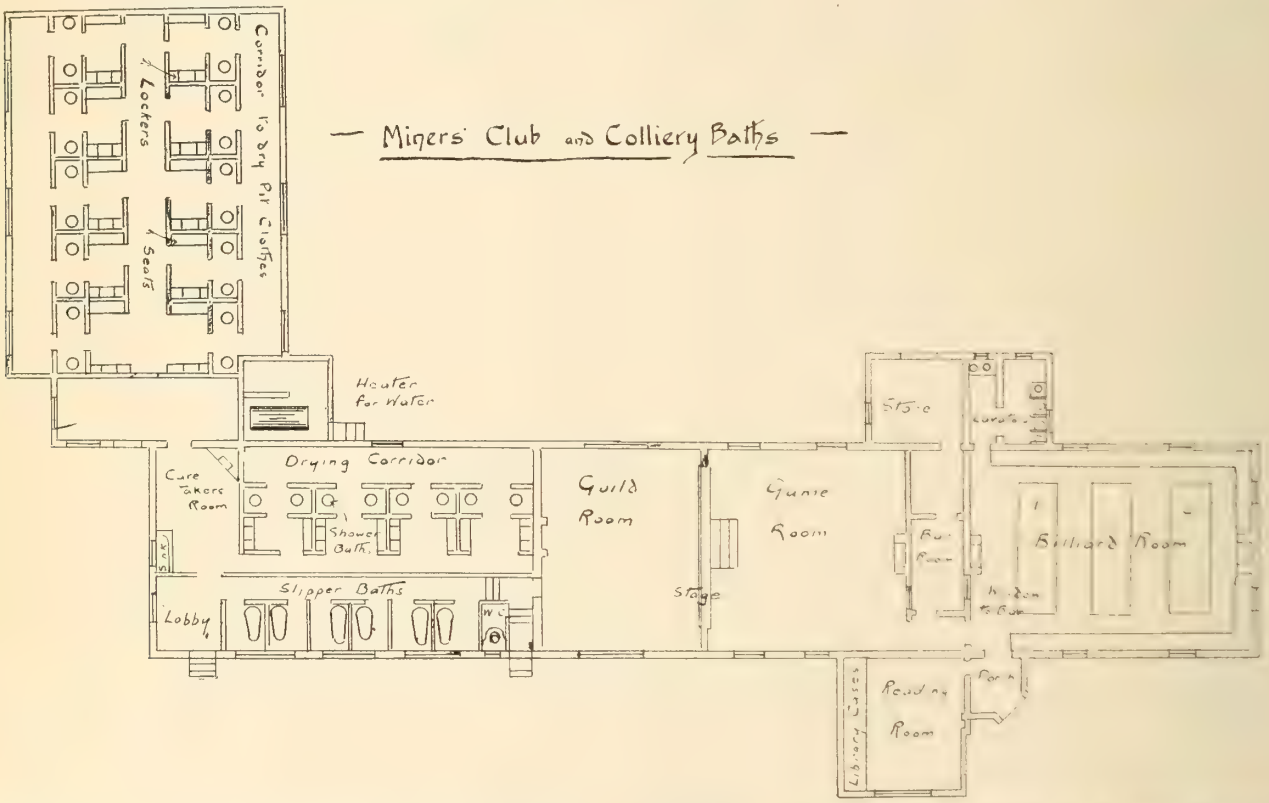
The Mechanics Institute movement that had such a vogue in the latter half of the Nineteenth Century has within the last two decades either spent its force or evolved along divergent lines.

The original impulse was largely educational, but in this day of cheap and good books, of magazines and periodicals in bewildering and wasteful profusion, of free libraries endowed by millionaires, of locomotion the speed and luxury of which has ceased to astonish us, the problem is not how to educate and improve our intellects, but rather how to find peace and quietness and a surcease from the eternal racket of man's noisy inventions, from the unremitting concentration of mind that modern life demands from those who work.

The debating society, which loomed so largely in our grandfather's days, has also ceased to attract, although the desire of the workingman to measure his wits against those of his fellows and to discuss in public the social problems of the day as affecting him and his, has in no wise abated. Nowadays the lodge room of the trades union society affords an outlet for the argumentative and oratorical longings that have been associated with British citizenship of all grades ever since the Witenagemote met beneath the village oak. The budding labor member finds in the activities of trades unionism abundant opportunity to sharpen those oratorical darts which he hopes someday to discharge in the legislative chamber.

For these and many other reasons the old type of workmen's club as represented by the Mechanics Institute has been gradually displaced by institutions, where the desire for amusement and the relaxation of social intercourse can be gratified, where, in a sentence, a man may cultivate cheerfulness of soul, apart from all questions and shades of politics and religion, apart from the interminable discussions of the rights of man or the world-old strife between him that hath, and him that hath not.

Among no class of workmen is the need of such institutions as pronounced as it is amongst miners. The surroundings of a mining town or camp are as a rule of the unloveliest or the rudest. The monotony of a carboniferous formation landscape is well known, and nature appears to delight in placing her treasure houses of silver and gold and precious stones deep in the mountain fastnesses or in some cheerless land of arctic cold or torrid heat. The miner loves to talk "shop" as everybody who has lived and worked with miners will testify. This tendency is to be noticed amongst the rising generation of miners, for the raw schoolboy after two days work in the mine talks "shop" as readily and as persistently as his father does. It is difficult for a person who has never worked underground to realize the absorption of the miner in his daily toil, and to realize also that underneath the surface is a network of roads and passages which the miner traverses daily, the names and "scenery" of which (if one may be allowed that term) are as well known to him as the streets and scenery of the upper world. The life and conversation of the miner therefore is underground, almost wholly detached from that of the rest of the world, and for this reason the society and institutions in which he is interested partake of the same detachment and have a tendency to become exclusive, for the true miner has a secret contempt for every trade but his own, and there is in consequence a kind of freemasonry between miners, and a strong line of demarcation between them and the rest of mankind.



The same characteristics mark the miner in Westphalia who greets his comrade going to work with "Gluckauf!" as mark the miner in Wales or in Cape Breton. The men who descend into the depths of the earth have an individuality as strong as the men who go down to the sea in ships, and the true miner is born, not made.

In most of the colliery towns of Great Britain, Europe and in the United States a "colliery club," "reading room," "institute," or by whatever name it is distinguished, the miners' club is a centre around which a great deal of the social life of the mining community revolves, and it is rare to find a colliery in European

mining centres, at least, that has not attached to it something in the shape of a workman's club.

A typical institution of this kind is to be found at a South Yorkshire Colliery employing from 1,500 to 2,000 workmen with which the writer is familiar, and a description of which will serve as an illustration of the general run of these clubs.

A large number of the employees at the colliery referred to, reside around the pit mouth, and the club is situated in the midst of the colliery village. It is well built erection of brick and stone. It contains a large billiard room, fitted with billiard tables and having upholstered seats running the full length of the walls, to accommodate the spectators at the billiard turnaments, which frequently take place between visitors from other collieries and the home team. Another room (see ground plan accompanying) is used for games of cards, checkers, etc., the stakes being limited within certain very small sums. Between these two rooms is situated the bar, heated corridor for drying the pit clothes, and lockers are provided for pit boots, soap and towels, which the men provide themselves. When first installed the baths were looked upon as a doubtful experiment, and all kinds of dreadful things were predicted of those persons who were so venturesome as to wash their backs, there being a superstition in this district, that ablutions weaken the back. To-day a further extension is contemplated as the lockers are in great demand. It will be noticed that the arrangement of the showers gives more privacy than the great "Waschkaues" of the German collieries, of which these baths are a modest imitation. In some respects the British collier is a very backward person, and it is surprising to know that the baths we have described are the only ones of their kind in England, notwithstanding the fact that cleanliness is a necessity to the miner, and the conveniences for bathing in their own houses are generally lamentably deficient, a state of affairs, however, that is by no means confined to

where light beers and mineral waters are sold. The landlord of the colliery will not allow saloons on his property, the nearest one being at least a mile away. The amount of liquor sold is limited to a certain number of glasses to each member, and is not sold to any person under twenty years of age. This arrangement has been found to work very satisfactorily, and has kept the men at home. Between the game room and the baths (see plan) there is what is known as the guild room, which is devoted to the use of the boys working at the colliery, and this room is so arranged that it can be thrown open to the game room by folding doors, and can be then used as a stage for concerts, entertainments and illustrated lectures of various sorts. The baths are a novel feature, being the only ones of their kind oustide the Continent. As will be seen there are six slipper baths, and twenty-eight showers. As first installed there were only eight showers, the additional twenty having been put in after the others had proved financially successful. The shower baths are used by the men after work. There is a steam

England. Attached to the club is a good permanent library and a reading room, which is kept well supplied with the daily papers and periodical literature. This room is well attended and strict silence is enforced.

The club is perfectly self sustaining and pays a dividend of about 8 per cent. on its shares. The buildings are the property of the Coal Company, but the management of the club's affairs and finances is entirely in the hands of the members. The club is a member of the Working Men's Club & Institute Union, which consists of 1,120 clubs all over the British Isles.

It cannot be disguised that the chief financial support of these clubs comes from the sale of exciseable goods, chiefly beer and tobacco, and at the present moment a red hot agitation is being conducted by the clubs against certain proposals of the present Government, among which is police supervision of clubs that sell drink to their members. It is difficult to understand a certain type of temperance agitator, and it appears likely that these clubs will have to suffer for the sins of disreputable

associations for the sale of liquor outside of licensed hours, that have sheltered themselves under the guise of clubs.

In the United States prohibition in mining camps has proved a ridiculous failure, of necessity, while the restricted club has proved the best aid to sobriety that the mine owner has been able to call to his assistance. In Germany a colliery without its bierhalle or casino would be a nine days' wonder. In many English colliery villages institutions like that just described have kept whole populations sober, who would otherwise have gone afield to get drunk every week end. In Canada the writer is only acquainted with Cape Breton collieries, where they have a ridiculous enactment that prevents the sale of liquor within one mile of any mine, on paper that is, for sad to relate every payday the outputs drop down and remain down for three and four days. The only virtue of this enactment is that it gives the colliery companies power to root out an obnoxious saloon keeper if necessary. It is admitted by everybody, but the temperance crank, that a workman's club cannot be successfully run to-day unless the sale of liquors and tobacco is permitted, and as to which is the better, the restricted and properly regulated club, or the long bar behind locked doors where a man takes his liquor, pays his dollar or more, gets no change, and is straightway "paralyzed"; no one but the said crank would hesitate to say. But under existing laws the man who wishes to drink must do so in some such hole and corner way.

We think it can be safely asserted that a well managed club somewhat on the lines of the one described in this article where men can enjoy some little relaxation of mind and body after their day's work, a place not too Puritanical in its rules nor too lax on the other hand, where men can take refuge from wash-day and other domestic turmoils without the risk of getting "loaded" and losing a week's pay, is a useful adjunct to any colliery, and the subject is one that should commend itself to coal corporations and their officials.

NOTES ON COBALT ORES.

W. K. McNeil.

Owing to the complex nature of the ores of the Cobalt District, certain difficulties are encountered by the chemists who attempt their assay. A few hints on the method and apparatus employed are here noted.

The ores of this district comprise mainly, smaltite, niccolite, native silver, argentite, all associated more or less with calcite. The rarer minerals such as ruby silver, dyscrasite, etc., do not play any impartant part.

Owing therefore, to the richness of many veins the sampling of these becomes a question of the first importance; and even in the smallest assay office a power crusher should be employed. The jaw crusher has been found to do excellent work, the crushed product being very uniform, and only a small amount of fines resulting. Here may be mentioned the absolute necessity of a plate glass quartering or sampling table. By its use the smallest danger of salting is avoided. As said before the richness of the ore in many instances must put the chemist ever on his guard against this danger, as very often he unconsciously salts the sample by using screens of very poor shape. Such unfortunately are sold by many of the supply houses.

To grind the sample to a suitable mesh for assaying many use the disc grinders made of hardened steel. These may be used with impunity on ores that are low grade. But on high grade, or any grade ore, the final grinding should be done on a buck board, which can be easily cleaned. And here may be stated the necessity of having two boards, so that rich samples will not be ground on the same surface as poorer ones. Any metal surface will in time absorb silver.

The preparation and charging of the samples differ not materially from other silver bearing ore, except that scorification takes precedence; and here there is great room for research work to show the relative values of prucible and scorification assay. Taking for granted that the scorification process is used, the main point to be noticed is the fact that arsenical ores such as are found in this district will not stand roasting, as silver is lost by volatilization. Hence the charge must be so mixed and the temperature of the furnace so regulated that the roasting is entirely eliminated. Many assayers complain of the bumping of the assay during scorification. This can be overcome by having:—(1) The scorifiers thoroughly dry; they absorb moisture readily if stored in a damp place, the battersea particularly showing this defect; (2) the charge well mixed; (3) the scorifier not too deep; (4) having the furnace at the proper temperature. A small covering of litharge is here found to be advantageous.

When very accurate work is required a large number of samples should be taken. It is found to be almost an impossibility to duplicate exactly any result in a smaltite or niccolite bearing ore, and check assays should always be run to determine the error of volatilization in the furnace.

The comparative value of a litharge charge in a crucible assay was discussed in an excellent paper written by Mr. Large, and read before the American Society of Chemists which held its annual meeting in Toronto in 1907. There are still many interesting points left for original work in connection with the smaltite and niccolite ore.

An excellent standard flux, that may be used for general low grade work, consists of soda carb., borax, and argols in the proportion of 12: 8: 1. This has the advantage that it can be used as a standard and any change necessary is one of addition.

Muffle fusion for crucible work is to be preferred when a large number of samples are to be run; as the heat can be more easily regulated. In the assay of these ores the correct temperature is one of the main features to be watched.

The construction of a suitable furnace is a point that invites considerable discussion, as it seems to the writer that the present style of furnace does not meet all the requirements of the case.

The assay of nickel and cobalt is now done entirely by the electrolytic process where it is possible to extract all metal. The solution of the ore is very readily accomplished in nitric and hyrdrochloric acids, with sulphuric as an indicator. One of the main points to be observed is the difficulty in extracting all the arsenic. The solution must be reduced thoroughly and H_2S passed in for a considerable time. The writer found it advantageous to pass the gas through the solution which was at a boiling temperature, and continue until the solution cooled, and then boil the solution for some time. After filtering off the sulphide, repeat the operation, to see if any arsenic still remains unprecipitated. Another difficult matter is to prevent the cobalt and nickel being precipitated with the iron, for this several precipations

are necessary; although if the solution be thoroughly oxidized and the precipitant added slowly to the hot solution, separation is omre easily obtained. Many chemists have spoken of the difficulty in using potassium nitrite as a precipitant. This is really a matter that experience in the use of any one method must decide. It seems to be a question of the exact amount of reagents used and of the exaet temperature at which they are to be used.

In closing, the writer wishes to suggest that letters discussing the laboratory treatment of cobalt and other ores would be most beneficial to all concerned. It is hoped that the brief notes above given will open the way.

THE SIXTEENTH ANNUAL REPORT OF THE ONTARIO BUREAU OF MINES.

Deputy Minister of Mines Thos. W. Gibson, in his introductory letter states that the sixteenth report is the first to be issued since the changes in the status of the Bureau of Mines made by the Mines Act, 1906. The Bureau is now an integral part of the Department of Lands, Forests and Mines. Mr. Gibson is no longer entitled Director, but Deputy Minister. The change has no effect upon the functions of the Bureau other than that of giving it a more dignified position.

The first forty-eight pages are occupied by the Deputy Minister's statistical review. Condensed within these limits is a large amount of valuable information. Only upon a few points will space permit us to touch.

Statistical Review.—The total minerals production of the province of Ontario for the year 1906, is valued at $22,388,383. The basis of this estimate is the selling prices of the products at the mines or works. On this basis, of course, comparisons instituted between Ontario's and that of other provinces is unfair to the former.

The value of mineral production in 1905 was $17,854,-296. The following table displays the chief factors in the increased output of 1906:—

Product.	1905.	1906.	Change.
Metallic—			
Silver	$1,372,877	$3,689,286	I. $2,316,409
Nickel	3,354,934	3,839,419	I. 484,485
Copper	688,993	960813	I. 271,820
Lead	9,000	93,500	I. 84,500
Iron ore	227,909	301,032	I. 73,123
Pig iron	3,909,527	4,554,247	I. 644,720
Non-metallic—			
Brick, common	1,937,500	2,157,000	I. 219,500
Brick, pressed	234,000	337,765	I. 103,795
Cement, Portland	1,783,451	2,381,014	I. 597,563
Corundum	152,404	262,448	I. 109,984
Natural gas	316,476	533,446	I. 216,970
Petroleum	898,545	761,546	D. 136,999

Adopting the system of valuation in vogue in British Columbia, Ontario's total 1906 mineral production attains a value of $33,905,574.

As compared with 1902, the figures for 1906 show an increase of 67 per cent.

Gold.—The output of gold has declined steadily since 1902. During 1906, 3,926 ounces were produced valued at $66.193; the St. Anthony Reef, Laurentian, Sultana, Shakespeare, Olympia, Rush Bay, Golden Horn and Craig mines being responsible for nearly all of this, 11,791 tons of ore were crushed, being an average gold tenor of $5.60. It is somewhat discouraging to note that wages paid amounted to $152,011.

Silver.—Under this section appears a short sketch of Cobalt's beginning and subsequent history. It is noted that Cobalt yielded 5,401,766 ounces in 1906. Outside of the Cobalt region silver was produced at the West End Silver Mountain mine, west of Port Arthur, operated by the Hanson Consolidated Mining & Smelting Company, and from the Bessemer mattes refined for the Canadian Copper Company.

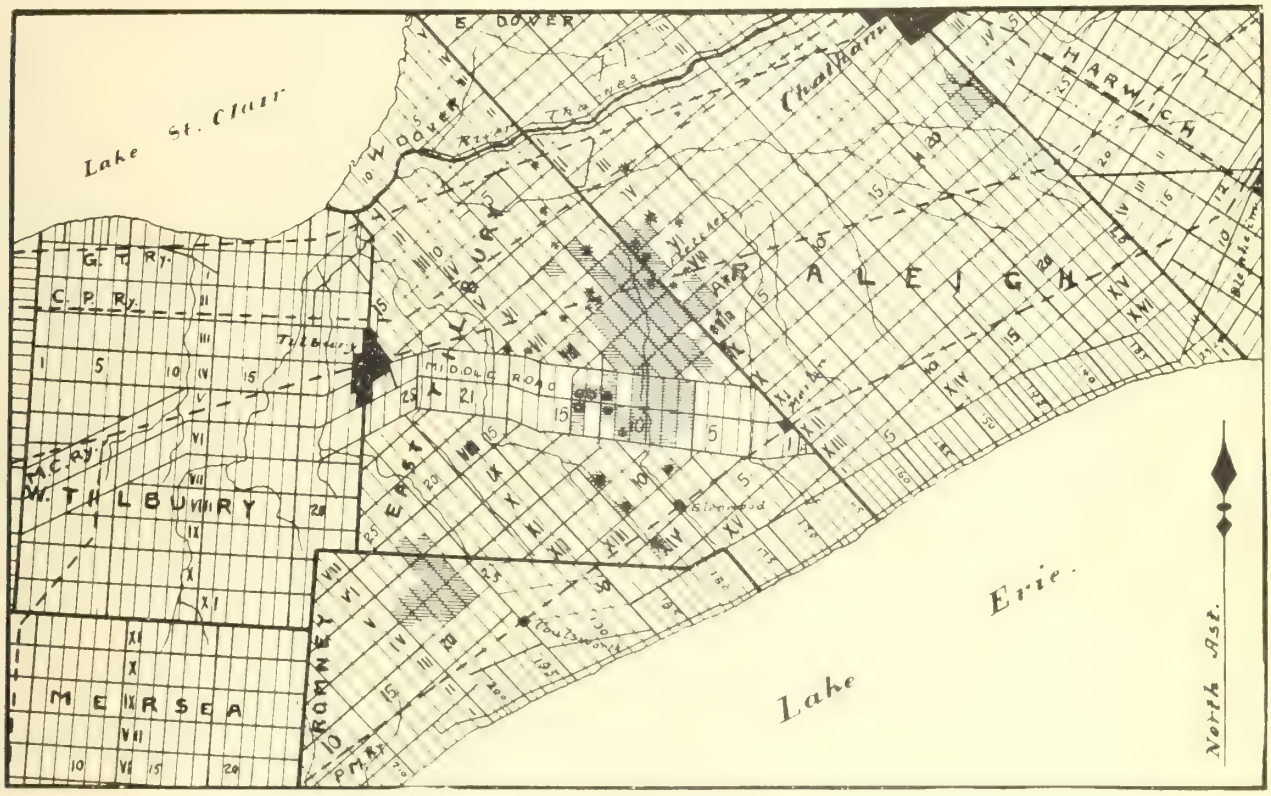
A description of the Provincial silver mine, owned and operated by the Province of Ontario, is included here. This is a unique enterprise so far as North America is concerned. The mine is situated within an area or 100 square miles, known as the Gillies Limit, lying on both side of the Montreal River and penetrating the township of Coleman with its northern apex. This land was reserved by the Government when the Cobalt excitement was at its height. The Legislature approved of the proposal to prospect and work the mineralized section of the Limit. The necessary funds were granted and work was begun in the spring of 1906, under the supervision of Professor Miller, the Provincial Geologist. A heavy over-burden of soil made prospecting difficult. To encourage systematic search, a bonus of $150 per inch of width for the discovery of rich silver-bearing veins was offered. On July 19, 1906, a seven-inch vein of smaltite, niccolite, and native silver was discovered by Messrs. T. Brown and G. R. McLaren, two mining students. Between them was divided the amount of $1,050. The native silver occurrred in sheets, nuggets, and small particles disseminated throughout the vein.

A shaft, sunk 10 feet from the vein, is down 120 feet. At 75 feet a cross-cut was run to the vein. Drifting northeast to the extent of 110 feet and southwest 75 feet is reported. The vein continues rich and of constant width so far as worked.

A suitable shaft house, an ore house, a power house, office, bunk house, dining room and blacksmith shop have been built. Two No. 42 Rand drills and two 2 3-4-inch Mac drills are operated by the high pressure half of a B-3 Rand compressor capable of delivering 450 cubic feet of air per minute. One 7 by 10-inch double cylinder Jenckes hoist, a duplex Worthington pump and a Cameron sinking pump are included in the equipment. In the power house is a 100-h. p. Jenckes return tubular boiler. A spur line of the T. & N. O. Railway, from Cobalt, to Kerr Lake, will pass close to the Provincial mine. The future working of this mine will be watched with intense interest.

Value of Ore.—The average value of ore shipped during 1904, 1905 and 1906 was $704 per ton. In 1904 the ore averaged $862. During 1905 much low-grade stuff was shipped and the average fell to $687 per ton. But the year 1906 saw the average jump up to $705 per ton. Although much of the ore in 1906 was second or third class, still there were many carlods of exceptionally

high silver tenor. The minimum limit of profitable shipping is approximately 100 ounces of silver per ton. It is probable that the numerous concentration plants now in operation or nearing completion will have the effect of cutting out low-grade shipments almost entirely.



Excepting the element cobalt, silver is the only constituent of the ores that is of value to the shippers. In silver-bearing ores cobalt is paid for if in excess of 6 per cent.; in non-silver ores, cobalt is paid for at the rate of 60 cents per pound if present to the extent of over 16 per cent, lower percentages are paid for at almost the same rate. British manufacturers of cobalt oxide are the principal consumers. They advance 75 per cent. of the value upon shipment and settle for the balance on umpire assay in Great Britain.

From a tabular statement of dividends paid, up to 30th June, 1907, we gather these facts:—

A total of $1,805,938 was paid in bonuses and dividends up to December 31st, 1906. During the first half of 1907 the corresponding amount was $917,741.40.

Nipissing paid $950,000 up to the end of 1906, and $400,000 during the first 6 months of 1907. T. & H. B. paid $746,120 during 1906; Coniagas $200,000 in the former half of 1907; Cobalt Silver Queen, $120,000 in the same period. Other mines with less amounts to their credit are: Buffalo, Foster, McKinley-Darragh, Right of way and Trethewey.

Adding to the total amount given above, the returns of what are practicaly close corporations, such as La Rose, Kerr Lake, Drummond and O'Brien, the net

Plan showing East Tilbury and Romney Oil and Gas Fields, Kent County, Ontario.

Shaded Parts—Approximate oil and gas area. ◆—Gas wells. '—Dry holes.

The principal purchasers of the ore produced in Cobalt are:—

The American Smelting & Refining Company, Perth Amboy, N.J.

The Balbach Smelting & Refining Company, Newark, N.J.

The Orford Copper Company, Copper Cliff, Ont.

The Anglo—French Nickel Sydicate, Swansea, Wales.

The last named company purchases only silver-free cobalt ores.

To the above list may be added the Deloro Mining & Reduction Company, Limited, whose plant at Deloro is now in full working. The Kirkpatrick-Kirkegaard process is being used there.

Dividend-paying Mines.—The remarkable case of the Temiscaming & Hudson Bay Mining Company, which on a paid up capital of $8,110, has paid in dividends 92 times that amount, is mentioned. Most of these dividend payments were from the proceeds of the sale of the Silver Queen.

total returns up to June 30th, 1907, will approximate to four millions of dollars.

Mining Revenue.—Hurrying over the returns for copper, nickel, iron-ore, salt, petroleum, etc., etc., we notice under the heading "Mining Revenue" that the gross receipts of the Mines Department in 1906, stand thus:—

Sales	$118,244
Leases	46,621
Miner's Licenses and Fees	70,256
Royalties	15,000
Total	$250,121

It is noted, while the law of 1891 required the expenditure of a certain amount of money per acre within a given time by the lessee of mining lands, the law of 1906 requires the applicant, after staking and recording his claim to perform 240 days work upon it. Prospectors also are required to hold a miner's license, renewable annually on or before March 31st. Many companies

must hold a miner's license, the fee for which is proportionate to the amount of capital stock.

The item of "Royalties" will be many times larger during 1907.

Mining Companies.—263 mining companies were organized, during 1906, under the laws of Ontario. Their total capitalization was $184,677,000. 18 companies of foreign incorporation were licensed to do business in Ontario. Their united capital was $12,536,000.

Diamond Drills.—Of the diamond drills, owned by the Province and rented out to prospectors, note is made of only one—the Sullivan "S" drill. One hole 123 feet deep, sunk in diabase, was put down at a cost of $598.96, or $4.87 per foot. The gross cost of diamonds was $210.80, or $1.71 per foot. The Department stands 35 per cent. of the total cost. Other figures of drilling costs are $11.91 gross cost per foot through conglomerate, and loose and broken ground.

Accidents.—Two men more were killed in 1906 than in 1905. Eleven were killed, eleven slightly injured, five seriously injured. Five of the men killed received their injuries above ground, six below ground. Dynamite was responsible for the death of but one man. This is cause for congratulation. The Department has taken pains to disseminate information on the use and care of dynamite. We take it that the fact that but one man was killed from this cause was largely due to the interest taken in the matter by the Government. When one considers the larger activities of 1906, as compared with previous years, the record is all the more satisfactory.

Mining Divisions.—The year 1906 was marked by the extension of the principle of decentralization in the administration of the various mining Divisions. The aim of the Department was to place a competent officer wherever necessary, who would, as far as possible, deal with applications for mineral lands without reference to headquarters.

Provincial Assay Office.—At the Belleville Laboratory, 1,838 ore samples were tested quantitatively during 1906 for one or more elements. 191 were examined qualitatively. Much special work was done for the Bureau of Mines. For the public a large number of assays, analyses, identification, etc., were made. Information concerning the value of minerals and the market was supplied to many owners. Umpire assays and analyses were also done. Mr. A. G. Burrows, M.A., B. Sc., Provincial Assayer, reports altogether a most successful year.

Summer Mining Classes.—This educational enterprise, recently the subject of warm commendation from an English journalist, has for some years been in the of Dr. W. L. Goodwin, Director of the School of Mining, Kingston, Ont.

Dr. Goodwin, who was assisted for a time by Mr. J. Watson Bain and later by R. Y. Fitzpatrick, confined his attention largely to the Temiskaming district. 30,000 mineral specimens were distributed to prospectors, of whom 930 attended classes. Dr. Miller's "Minerals and How they Occur" was largely used by many of the men as a basis upon which to work. Classes were held in Latchford, Cobalt, Haileybury, New Liskeard, Tomstown, Giroux Lake, Boston and intermediate points.

The importance of this peripatetic summer school is recognized more by outsiders than by Ontarians. It is one of the outstanding educational features of the Province. Much more of it is needed. Although it is impossible to estimate the benefits resulting from this instruction, it may confidently be stated that Ontario's mineral output would have been much less than it is today had these summer classes not existed. The idea is a good and practical one. It is yet in the germinal stage and could most profitably be expanded. Dr. Goodwin's brief report is by no means the least important section of the volume.

Mines of Ontario..—The comprehensive report of Inspector E. T. Corkhill, on the mines of Ontario can be noteicd but briefly. It will be the subject of extended attention in a later number of the CANADIAN MINING JOURNAL.

Mr. Corkhill mentions the small amount of development work done at Larder Lake and the impossibillty of forecasting the future of that camp. Sturgeon Lake and the Upper Manitou region were the scenes of the principal activity in gold. The Abitibi country also came in for attention.

Refering to the erection of expensive plants on improved properities Mr. Corkhill writes thus:—"This has been Ontario's great drawback, namely, the installing of expensive machinery before the ore bodies have been tested, and it is to be hoped that the majority of the companies will prove up their ground before going to the expense of erecting costly works on the surface.

The Inspector alludes to the activity in prospecting for iron ore; to the development of copper properties during the last two years, especially along the north shore of Lake Huron; and to the need of strict observance of the regulations of the Mines Act, regarding the handling of dynamite.

Oil and Gas in Kent.—Mr.Corkhill's report is followed by a paper on oil and gas in Kent, written by Mr. C. W. Knight, Assistant Provincial Geologist. This excellent monograph demands all the space that can be spared. It is carefully written, is simple and direct in style and diction and presents some new and interesting facts.

The Kent fields, Tilbury and Romney, are named after the townships in which they occur, and lie between Lake St. Clair on the northwest and Lake Erie on the southeast.

(To be Continued.)

"RARE SPECIMENS"—OF IGNORANCE.

We take the following *verb. at lit* from the *Toronto World*, as published under Cobalt date, November 22nd:

"They have also a vein of iron pyrites, carrying $7 in nickel, $3 in silver, and the quartz carrys $4 to $5 a ton in gold. A large calcite vein which has been traced for about 2 miles varying in width from 10 to 25 feet, one of the rare irons have been found in this calcite, namely calum balite, or tantalite on the same vein, directly north. A claim owned by Maneaux and Daly assayed $105 in galena and $6.95 in silver. This claim is under option for $55,000."

Considering that galena is a sulphide of lead and that lead is worth 4.75 cents per pound, or $95 per ton, the contents of this rock, irrespective of silver values, are conclusively exceptional. And as "a claim" is represented as assaying this the silver by-product is an Ossa piled upon a Pelion of profit. Then again, the existence of "calum balite"—the "rare tantalite"—is a discovery meriting the award of the Nobel prize for assininity to the writer, if not the editor, who published the fact. If Wendigo Lake is at all buoyant on the strength of such reports its residents should give their authors the iced bath treatment. Nor should the lay journalists of Toronto be exempt.

ALEX. GRAY.

THE LARDER LAKE DISTRICT.*

R. W. Brock.

Note.—This report is based on field work which occupied about two weeks' time. The rocks have not yet been subjected to microscopical or laboratory examination. Consequently, the report must be considered tentative and subject to revision.—R.W.B.

Situation and Means of Access.

Larder Lake lies about 34 miles north of the head of Lake Temiskaming, two and a half to three and a half miles west of the inter-Provincial Boundary Line between Ontario and Quebec, and a few miles south of the height of land separating the Ottawa and St. Lawrence waters from those flowing northward to James Bay. The location of the corner posts of the townships of McGarry, McFadden, Hearst and McVittie would fall in the main body of the lake near the north shore, so that the northeast arm lies in McGarry, the southwest in McFadden and most of the western part of the lake in Hearst.

Access to the lake may be had by several routes. Those most frequently followed are via Tomstown, on the Blanche River, which may be reached from Haileybury and New Liskeard either by steamer up the Blanche River, a twice-a-day service, or by two and three-quarter miles by waggon road from Tomstown.

From Tomstown a canoe route or a waggon road may be taken. The river from Tomstown to Wendigo Lake on the east or Abitibi branch of the Blanche is swift, and three portages are necessary, the last one being a mile and a half long, so that the best part of a day is taken in covering this distance. As it is only about seven miles by wagon road to Wendigo, this is usually made the starting point for the canoe journey. This canoe route leads northwestward through the Wendigo Lakes and a connected chain of eight small lakes to Raven Lake, across the south end of Raven Lake to Larder creek and up the creek to Larder Lake. This route can be easily followed and the portages are short and light. The only portages of any length are the one into Raven Lake and the one from Raven Lake, round the falls of Larder creek. These two are each about one-third of a mile long. The trip from Wendigo to Larder can be made in a day, and at present this forms the best summer route for travellers and supplies.

There is also a wagon road from Wendigo to Larder Lake. A little byond the half-way house this road forks, the west branch followed by the telephone line running to Spoon's Bay, and the east branch connecting with Fitzpatrick's Bay, about sixteen or seventeen miles from Wendigo.

While a good route in winter, and not too difficult for foot passengers at any time, the wagon road is next to impassable for horses at the Larder Lake end except during the winter season. A trail runs from Boston on the Temiskaming and Northern Ontario Railway to Larder Lake city, a distance of about twenty miles. A good wagon road is now under construction by the Government between these two points, which when completed will afford the readiest means of transportation into Larder Lake.

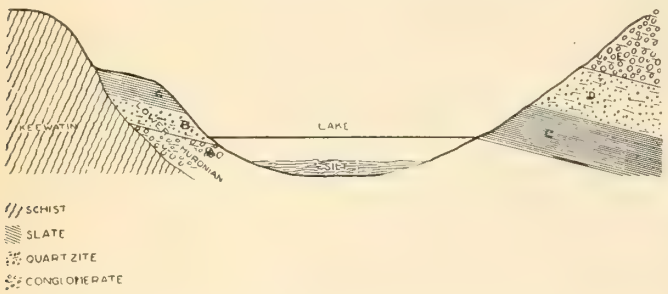
The first exploration of Larder Lake was by Prof. W. G. Miller, now Provincial Geologist, who in 1901 made a reconnaissance survey of the Blanche River, in search of iron ore formations. He ascended the Abitibi branch and crossed Larder Lake or Present Lake, as it was then called. In his report, published in the Report of the Bureau of Mines, 1902, he called the attention of prospectors to the mineral possibilities of the region.

In 1904, after the discoveries at Cobalt, W. A. Parks made a geological survey of this portion of the country for the Geological Survey of Canada. His report was published in the Summary Report of the Geological Survey for 1904. The main object of this survey was the deliminitation, north of Lake Temiskaming, of the rock formation which at Cobalt had been proved to be silver bearing. He notes the discovery of gold during the summer, along the chain of lakes between Wendigo and Raven Lakes, and expresses the opinion that this region is worth prospecting for gold.

Discovery of Gold.

During the summer of 1906, the great demand for mining property in Northern Ontario, created by the Cobalt boom, caused prospectors to extend their operations far beyond the limits of the Cobalt field, and a number of parties found their way into Larder Lake. It is said that gold has long been known to occur at Larder Lake by an Indian, Tonene, in whose hunting ground the lake lies, and that when prospectors began to approach his territory he located the first claim, thereby attracting their attention to this as a gold district. The writer has not verified this story. Before the end of the season a number of prospectors had staked claims on the lake which furnished specimens of free gold. The samples which they brought down at the end of the season caused a winter stampede to Larder Lake, and practically all the ground in its vicinity and for some miles north was speedily staked. Something like four thousand claims were recorded. Necessarily a large number of them were snows-stakings of doubtful value. Companies were formed during the winter, to prospect and develop Larder Lake claims, but only a portion of the necessary supplies reached Larder Lake before the break up of the winter road, and since then it has been impossible to get them in so that little development work that would prove the value of a property has been done or may be done this season.

Topography.



The country about Larder Lake is on the whole of low relief, having the typical glaciated form of the Laurentian peneplain. Its surface is uneven, being broken by depressions occupied by lakes and muskegs, by knolls of sand or gravel, and by protruding knees or elbows of rocks. The skyline, viewed from the higher hills, is very regular and even, but is occasionally notched by a valley or by a monadnock hill of more resistant rock. Along the southeast and east of the lake, a range of hills rising 500 or 600 feet above the lake, separate Raven Lake valley from that of Larder Lake. At the north end of this range, cut off from it by a pass, is an isolated, mesa-like hill, call Shiminis.[2] This hill has an elevation of about 750 feet above Larder Lake, and is about three miles from the head of the northeast arm. It forms the most striking object in the topography of this region.

The lake in many respects resembles Temagami on a small scale, with its arms and numerous islands. As a rule the shores are rocky, often steep, and in a few places rise abruptly as cliffs. High cliff faces, both round the lake and on the hills away from the lake, are almost invariably formed by vertical joint planes in the

Sixteenth Annual Report of the Ontario Bureau of Mines.

conglomerate formation, which will usually be found on the higher elevations. The average of barometer readings for June gives an elevation of about 1,100 feet for the lake. The shores reach an extreme height, at the head of Fitzpatrick's Bay, of 200 feet above the lake. The depth of the basin occupied by the lake could not be determined, as there was no means of estimating the extent to which it had been filled with silt. The deepest sounding obtained was in the narrows where the depth was 94 feet.

The rocks of the district present considerable variety. While a good deal of the territory is covered with drift—and contacts between the various rocks are particularly

Ideal section showing relationship of rocks on Northwest Arm of Larder Lake.

liable to be covered with this recent, unconsolidated material—the relationship between the chief groups of rocks may be determined with considerable certainty. An inspection of their general characteristics, without consideration of the relationships exhibited leads naturally to a subdivision of the rocks into several formations. A similar subdivision into the same groups is arrived at by classsifying them according to their relationship to one another.

West and north of the lake is a complex, consisting of phyllites, schists, cherts, ferruginous dolomites and greenstones, cut by igneous rocks. These rocks as a rule are lying on edge and are characterized by the disturbances and metamorphism to which they have been subjected. Cutting them at various points about the lake are pegmatite and quartz porphyry dikes, evidently connected with a granite intrusion. From the number of granite boulders scattered over the surface, it is evident that not very far away the granite is exposed. While later than the rocks of the complex, the rocks of the granite family are undoubtedly older than the sedimentary rocks mentioned below as overlying the old complex, since these sedimentaries contain fragments of the granites.

Lying unconformably upon the preceding complex is a series of sedimentary rocks consisting of slates, quartzites and conglomerates. These are for the most part undisturbed, with gentle dips, except in the immediate vicinity of a later igneous intrusion, where they may show considerable local metamorphism. In such cases differentiation from the earlier complex may be somewhat difficult, but the undisturbed condition of these rocks affords the readiest criteron for their recognition. This series is exposed on most of the islands of the main body of the lake, on the north shore near the narrows, and on the east shore of the lake.

Later than and intrusive in the rocks above mentioned, is an igneous rock which in places presents a gabbro facies, and in others a diabase, and also a series of usually small, basic, mica dikes.

The rocks of the basal complex correspond perfectly, in position and in lithological character, in their disturbed and metamorphosed condition, to the oldest formation in the Lake Superior and Lake Huron districts, which the International Committee on Geological Nomenclature recommended should be called Keewatin. The rocks of the granite family correspond to the Laurentian as defined by this Committee, and the sedimentary series to the Lower Huronian. As no rocks newer than the diabase or gabbro were seen, it can be classified only as Post-lower Huronian.

Above the solid formations are glacial and post-glacial deposits of clay, sand and gravel. There are, then, in descending order the following formations:—

Name	Rocks.
Post-Glacical	Clays, sands, gravels.
Glacial	Boulder clay.
	Great Unconformity.
Post-Lower Huronian	Diabase, gabbro, mica lamprophyres.
	Igneous Unconformity.
Lower Huronian	Conglomerate, quartzite, slate.
	Unconformity.
Laurentian	Granite, pegmatite, prophyry.
	Igneous Uconformity.
Keewatin	Greenstone, lime, silicate rocks, schists, dolomites, cherts, etc.

It will be noted that the rocks here bear a strong resemblance to those at Cobalt, the chief difference being that none of the upper members of the Huronian are represented, but on the other hand the Keewatin contains a more varied assemblage of rocks.

It is interesting to find at such widely separated points as Lake Superior, Lake Huron, Cobalt, and the

Keewatin "Greenstone," which may represent altered limestone. The dark portions are green lime-silicate minerals: the light are calcite.

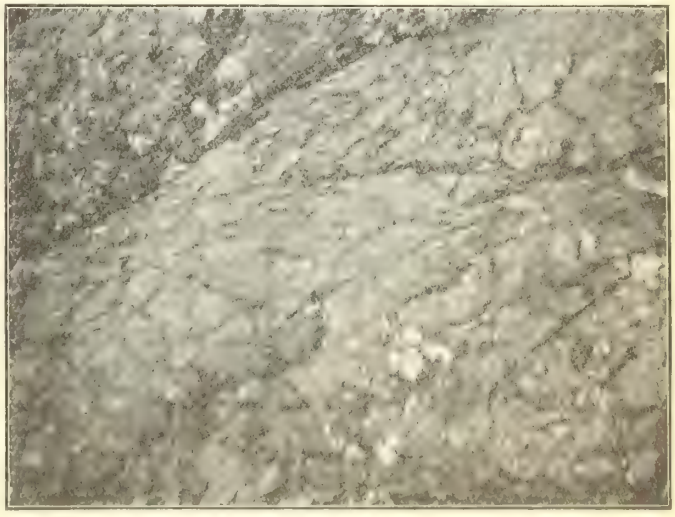
Height of Land, the same rocks, showing the same relationship, falling into the same scheme of classification; thus confirming the idea that the rocks are grouped represent great widespread systems, separated by profound alterations of geological conditions during great time intervals.

Keewatin.

The Keewatin, as above noted, consists of a complex group of rocks of both igneous and sedimentary origin.

highly disturbed and metamorphosed. Possibly the commonest rock is a green chlorite schist, which probably represents an old, squeezed, eruptive rock. Sometimes this is thinly fissile, and sometimes rather massive. Hornblende schists are rather common. A soft grayish-weathering schist with green chlorite seams is also of frequent occurrence. These schists are often charged with pyrite in well formed cubic crystals.

Bands of soft micaceous schists, phyllites or slaty rocks, and a rusty weathering dolomite (?) are in places conspicuous members of the series. With the latter rock on Pancake creek is a thinly banded chert, like the jasper bands of the iron ore formation. A banded green and white cherty rock on the east shore of Fitzpatrick's Bay, also bears a strong resemblance to Keewatin iron ore formation, a resemblance strenthened by the folding and faulting to which it had been subjected. From the number of its boulders in the Huronian conglomerate, typical banded red jasper and magnetite iron ore must occur near here, possibly buried under the Huronian. It is exposed in the township of Boston to the west.



Greenstones, some highly altered, and some showing original textures, cut the older rocks of the system. These greenstones often exhibit the typical spheroidal markings, torsion cracks, quartz and calcite seams that characterize the Keewatin in the Cobalt and Lake Superior districts. On the southeast corner of Fitzpatrick's bay, near the point west of the Golden Thorn, and on Haycock hill where Brunne's trail to Boston turns west round the bend of Pancake creek, is a rock consisting of boulder-like masses of green, calcium-magnesium-iron silicate, cemented by crystalline calcite. All stages from this pseudo-conglomerate to massive green-silicate rock with seams of calcite occupying gashes like torsion cracks, are to be found. The green silicate rocks present the characteristics of typical Keewatin greenstone. Where the rock consists of boulder-like masses of silicate in calcite, it bears a strong resemblance to a limestone partially altered to green silicate rock by contact metamorphism, and the massive greenstone to the more completely altered limestone. The numerous old intrusive rocks in the Keewatin would account for the metamorphism.

While it would require more detailed work to establish the truth of this hypothesis, there are several facts which make it quite possible that some of the Keewatin "greenstones" may have had this origin, although the majority of the greenstones, without doubt are altered eruptive rocks. The Keewatin certainly contains a considerable amount of sedimentary material which must have been metamorphosed by the extraordinarily numerous intrusions of igneous rocks. Limestones or ferriferous dolomites are included in these sedimentaries, and would be expected to be altered to green silicates. This would explain the remarkable richness in lime-carbonate which some of the Keewatin "greenstone" has been shown to possess.

The Gold-bearing Rock.

The most interesting rock from an economic standpoint near Larder lake is the rusty weathering dolomite(?). About 60 per cent. of the rock consists of lime magnesia-iron carbonate, the remainder of quartz and a soft green talcose silicate, probably serpentine. The origin of the rock is as yet a little uncertain. Certain dikes, when squeezed and altered, produce a rock which bears a strong resemblance to it, but its occurrence with slates and phyllites and with the cherts—undoubted sedimentary rocks—as a conformable band with them, over a wide stretch of country, and its apparent composition, render it much more probable that it is an altered, stratified, ferriferous dolomite, probably forming a member of the Iron Ore formation. This rock, especially where cut by the porphyry or pegmatite mentioned in the Laurentian on a later page, is traversed by innumerable stringers of quartz which in places are gold-bearing. This rock was seen northeast of Reddick's at the head of the Northeast arm, extending southwest, about parallel to the arm, to about the Proprietary Company, where it gets back a short distance from the lake, past Bear and Tonene lakes, Pancake creek, Bluebell and Maxwell claims, north of Larder City and around Pancake lake. A similar band seems to occur south of Spoon's bay, and at one or two points on Fitzpatrick's bay. The Keewatin rocks are folded, contorted and faulted. They are generally on edge. That this represents the true dip, and not merely schistosity, is shown by the succession of sedimentary bands on going across the strike.

The Keewatin rocks form the oldest and most disturbed formation at present recognized. These rocks were formed during a very extended portion of geological time and under changing geological conditions. It is more than probable that this series should be subdivided into several formations, for some of the rocks are very much newer than others and have been subjected

Spheroidal markings on metamorphosed Keewatin, north shore of Larder Lake.

to much less alteration. Some disturbed and squeezed conglomerates intimately related to the Keewatin, as on the west shore of the main lake about a mile below the narrows, seem to belong to this formation, and if so mark unconformities which might be utilized to subdivide the Keewatin. The subdivision is rendered difficult, however, by the degree of metamorphism, and the disturbances through igneous intrusions.

The Keewatin is not only cut by eruptives belonging to this period, but by later intrusions as well. As will be shown below, mineralization on an extensive scale took place during Keewatin times.

A long time interval elapsed between the Keewatin and Lower Huronian during which the Keewatin was a land surface subjected to heavy erosion. This erosion produced a topography not unlike that of this country at the present day. Some of the old Keewatin valleys are now present-day valleys, as the northeast arm of Larder lake, which, as the contact between the Keewatin and Lower Huronian shows, was a valley at the close of the Keewatin. Erosion and transportation must then have great-

ly exceeded atmospheric weathering, for the Keewatin surfaces and hills were swept bare of rotted rock before the Huronian was deposited on them.

LAURENTIAN.

Included in this formation are the pre-Huronian granites, and related rocks, which are intrusive in and therefore later than the Keewatin, but which antedate the Huronian. In many places in Ontario these rocks cover large areas. Often they have been mashed to gneisses. Around Larder lake, in the areas examined by the writer, the only possible representatives of this formation are the pegmatites and quartz porphyries that cut the Keewatin more or less frequently wherever it is exposed. Erratic boulders of granite are, however, abundant, and similar boulders are held in the Huronian conglomerate, so that it is reasonably certain that pre-Huronian granite occurs in the neighborhood.

The pegmatite dikes are numerous in the Keewatin. The quartz is apt to be segregated, and to contain more or less "mineral" such as pyrite and specularite. The country rock in the neighborhood is apt to be somewhat silicified and mineralized, and occasionally gold is found, as in the Gold Hill claim. The pegmatite becomes porphyritic in places, and passes insensibly into porphyry.

The porphyries are quartz-bearing rocks with distinct phenocrysts of feldspar. Sometimes the base is reddish and sometimes gray. These porphyries are also associated with mineralization of the neighboring country rock. At the Peerless Mining Company's claims on Fitzpatrick's bay the gray porphyry is mineralized with pyrite, and occurs as fragments in a quartz vein.

The dikes of porphyry are numerous in the Keewatin.

There were extensive disturbances following the Laurentian and previous to the deposition of the Huronian, and the former rocks were eroded extensively before the formation of the latter.

(To be continued.)

THE ECONOMIC DISTRIBUTION OF ELECTRIC POWER FROM BLAST FURNACES.

By B. H. THWAITE, Assoc. M. Inst. C.E. (London).

(*Continued from last issue.*)

Another and important argument in favor of the pooling policy is the fact that some 4,000 to 5,000 kilowatts of energy is the minimum demand of many of the most desirable of the electro-chemical and other operations, so that in a single works, without a drastic reorganization of the plant, it would be impossible to secure this output of electric energy; whereas, by the pooling of the available power from several works, this power would be obtained with little change from existing conditions. Of course the power available entirely depends upon the extent the gas engine displaces the steam engine to satisfy the internal power demands of the works.

The following table gives an impression of the power available from several works in a district, without any change of plant and operations, to secure the fullest possible economy of the water gases. The works, although in one district, are scattered:—

	Kilowatts available for external services.
District A, one furnace always available	1,490
District B, two furnaces	2,700
District C, one furnace	1,700
Total available	5,890

By the pooling system a minimum total power potential of 5,890 kilowatts is available, and this would justify the setting up of electro-chemical and electro-metallurgical apparatus.

One of the advantages of this policy of pooling is obvious: it would not only permit such an association of power production as to justify the cost of mains to central stations, but it would provide an irresistible incentive to the thorough electrification of all the iron and steel power machinery, and justify the expenditure in securing the maximum possible efficiency of the blast furnace gas.

The axiom that unity is power could not be more appropriately demonstrated than by the pooling of the power from the furnaces of several works, which, individually, would be too small to justify the establishment of a central distributing station and its associated transmission mains.

The policy of pooling furnace gases is the basis of an Act of Parliament which received the royal assent last year, and applies in an area some 400 square miles in extent, including in the area many furnaces belonging to separate firms. The full description of this pooling scheme may constitute the object of a future paper by the author, who is one of the engineers of the Parliamentary bill.

It is very likely that there are iron-making districts where it would not be necessary to incure the expense of securing Parliamentary powers for rights to lay down the electrical transmission mains, or where it would be possible to sell the whole of the pooled and available power to satisfy the demands of one electrical industry: for instance, that of producing calcium carbide (the basis of acetylene gas production), which, as the author has frequently pointed out in 1898 and since, is an ideal associate for an iron works, because the agents of production are coke, limestone, and electric energy. Again, the production of aluminium, the operating process of which is now common property, involves the production of many thousands of kilowatts of energy.

In the promotion of the Act of Parliament above referred to, the one objection met with was, that supposing the market for iron does not justify the manufacture of pig, and it became financially imperative to blow out the furnaces, what about the supply to the pooling station under these circumstances? Of course it was admitted that the profit secured from the furnace gas would reduce the risk in making the stock; but supposing it did not, what then? The author has solved this difficulty by designing a generator that, harnessed to the furnace gas cleaning plant, produces gas of more or less exactly the composition of furnace gas.

The combustible portion of a typical example of this gas is chemically constituted as follows:—

	Per cent.
Carbon monoxide	32.4
Marsh gas	0.4
Hydrogen	1.6

The cost of this apparatus is small, because the cleaning plant and associated gas mains are those installed for the furnace gas. Such a generator, of the generating capacity of the pooled gas proportion from a given furnace, would be available within three hours' notice, and the simplicity of the apparatus makes the question of depreciation during standby periods of little or no economic importance. The fluid slag from this generator can be readily converted into slag wool. This furnace type of gas generator, designed by the author, is being adopted by one of the most important of continental iron firms to compensate for the vagaries of furnace output, and is also to be used in the above-mentioned parliamentary proposition. It was illustrated on page 262 of the "Journal of the Iron and Steel Institute," 1906, No. III.

The advantages of the pooling policy will, of course, depend upon the individual circumstances of different works. The mills are probably standing some 23 per cent. of the total hours of a week, and the power waste associated with this idle week-end period will be available. Besides, the displacement of the steam rolling and other machinery by gas and electric motors will provide power all the week, and the auxiliary gas generators can be drawn upon to balance the power required for the mills.

The great change in the attitude of the Board of Trade in relation to electrical transmission schemes makes the pooling policy more economically desirable in England than it would have been when the Government department insisted that the electric mains should be placed underground, involving a heavy expenditure in wayleaves and in construction and maintenance.

The permission, under reasonable restrictions, to transmit by aerial cables means a reduction in cost of no less than one-fifth that of an underground transmission line. This means for the same expenditure on underground mains an increase of length of aerial transmission line of five times, and as with the modern experience of high-pressure transmission systems the loss of energy in transmission is comparatively of little consequence, it is obvious that the area of the field of demand for the pooled power is increased, say, directly as the square of the diameter.

To understand the progress in the efficiency and unit porportion of electrical power generation and transmission systems, the following comparison may be quoted, in which the author's original proposition of 1892, prepared in collaboration with Mr. James Swinburne, F.R.S., supported by estimates, etc., from the leading continental experts, is compared with the state of affairs to-day:—

Year of 1892—Unit power of gas engines, brake horse-power, 300; thermal efficiency, per cent., 20; electric generators, kilowatts, 1,500; pressure of transmission line, volts, 20,000; economic distance, miles, 100.

Year of 1907—Unit power of gas engines, brake horse-power, 3,000; thermal efficiency, per cent., 30; electric generators, kilowatts, 10,000; pressure of transmission line, volts, 88,000; economic distance, miles, 250.

The harnessing of the gas-engine to the blast-furnace resulted in the almost immediate increase of its unit power capacity proportions. The author was prepared to design a 2,000 indicated horse-power single unit multiple cylinder blast-furnace gas-engine in 1899.

The flywheel type of electric alternating current generators of immense capacity assisted in the gas-engine increased power-unit evolution. The foregoing tabulated improvements all point in the direction of the policy of pooling or concentration of the power output.

The irresistable incidence of this pooling policy in even a modest way will be to ultimately displace steam by gas electric power for blowing and other furnace power requirements, for driving the rolls in the mills, and for satisfying the general power requirements, because the capital expenditure of the ironmaster will be mostly confined to the provision of the electric motor. This pooling policy should eventually lead to the suppression of all preventable wastes in the use of the furnace gases.

Recapitulating the advantages of pooling, it may be said that besides facilitating the electrification of the rolling mills by the reduction in capital cost of plant, it will secure, in addition to the advantages of electrical driving, a substantial increase in the proportion of the furnace power gas, available by the suppression of the mill steam boilers. The pooling proposition will constitute an ideal combine, securing an all-round benefit to the ironmaster and the power consumer, and tend to promote the establishment of new electrical industries and thus enlarge the field of demand for power; it will financially justify expenditure in apparatus and on technical changes to secure the fullest possible economy in the use of furnace gas in the works. Of course, any available gas from associated coke oven plant, subject to certain mixing operations as will reduce the proportion of hydrocarbon in the combined gases, will be available for the pooling station. The economy resulting form the direct production of power with a rationally devised plant has been abundantly proved. A well-designed and built gas-engine, using pure and waterless furnace gas and asosciated with a high-class electrical generating machine, is claimed to be able to develop the hours of a kilowatt year for 6 6s. 8d., assuming, of course, that no charge is made for furnace gas. This economic figure of cost to an ironmaster is unapproachable by any other system of power generation, barriing water power, which is often located in such awkward, if not, almost inaccessible positions as to destroy the economic advantages of such power, per se.

As the author pointed out in 1897, few iron-making countries can benefit to the extent available to British ironmasters, because of the geographic advantages possessed by Great Britain, and because of the fact that British manufacturing industries are so well concentrated geographically as to permit electric energy to be distributed under the most advantageous conditions, assuming always that the policy of the British Government is as beneficent in its attitude to the iron and steel industry as other governments are.

COAL MINE ACCIDENTS—THIER CAUSES AND PREVENTION.

The shocking calamities that have of late occurred in West Virginia and Pennsylvania have stirred this continent profoundly. That such wholesale loss of life is preventable is demonstrable. In Europe careful Government restrictions and inspection have reduced the rate of fatalities annually. The official control of the use of explosives, both as regards quality and quantity; the introduction of improved safety lamps; the use of breathing apparatus to asist in fire-fighting and life-salvage—these are the chief factors in the prevention of accidents and in meeting accidents when they do occur.

A recently issued preliminary statistical report, published by the United States Geological Survey, proves conclusively that present conditions are inexcusably bad.

During 1906 there were 6,861 men killed or injured in the coal mines of the U. S.; the total number killed was 2,061. The total number of men killed since 1889 is 22,840. During the last six years as many fatalities have occurred as during the preceding eleven years. That is, there are almost twice as many men killed annually now as there were before 1901. The great growth of the industry is not altogether accountable for this. As shown below, the number of men killed for each 1,000 employed has increased alarmingly and almost uniformly within the last decade.

Number of Men Killed in the Coal Mines of the United States for Each 1,000 Men Employed.

1895	2.67	1901	3.24
1896	2.74	1902	2.49
1897	2.34	1903	3.14
1898	2.57	1904	3.38
1899	2.98	1905	3.53
1900	3.24	1906	3.40

Contrasting these figures with corresponding returns for European coal-producing countries, it is found that the United States occupies a most unenviable position.

Number of Men Killed for Each 1,000 Employed—Averages for Five Years.

France (1901-1905)	0.91
Belgium (1902-1906)	1.00
Great Britain (1902-1906)	1.28
Prussia (1900-1904)	2.06
United States (1902-1906)	3.39

Within the last 75 years the Belgian rate has fallen from 3.19 to 0.94 lives lost per 1,000 men employed. The rate in Great Britain has ben uniformly low since 1891. Prussia in 1891 recorded 2.89 fatalities per thousand. In 1904 the figure was 1.80. France in 1905 had the extraordinarily low figure of 0.84. The Courrieres explosion in 1906 brought up this rate materially.

The improvement in European coal mining conditions is obviously attributable to restrictive legislation and to the establishment of testing stations for the study of problems bearing upon the safety of coal miners. The extensive experiments carried on by the Belgian Government which, by the way, leads the world in these matters, have reduced the casualty rate from 3.2 per 1,000 men employed to the present figure of less than one-third of that number.

In passing it is pleasant to note that a Canadian company, the Dominion Coal Company, has established a life-saving corps and is training its employees in the uses of breathing apparatus. The articles by Mr. T. W. Gray, appearing in recent numbers of The Canadian Mining Journal, have attracted widespread attention. It is a matter of congratulation that a Nova Scotian coal mine is setting the pace in providing for rescue work in case of accident. No other coal mine on the continent is so equipped.

The causes of coal mine accidents in the United States during 1906 are thus reported:—

Cause.	Killed.	Injured.
Gas and dust explosions	228	307
Powder explosions	80	215
Falls of roof and coal	1,008	1,863
Other causes	732	2,193

Comparison with foreign coal-producing countries again is detrimental to the United States:—

Deaths from Falls of Roof and Coal per 1,000 Men Employed.

Belgium	0.40
France	0.47
Great Britain	0.64
Germany	0.92
United States	1.70

The same contrasting tendencies are again marked. The death rates from these causes are constantly discussed in Europe, and growing larger in the United States.

In Europe the use of excessive charges of explosives is prohibited by law. No such control is exercised by the United States Government. The consequences are that the disturbing and jarring effects of heavy charges weaken the walls and roofs and are directly and indirectly the principal cause of falls.

Imperfect and unsafe types of lamps and the use of bare flames are also fruitful sources of disaster. Their use causes nearly all explosions of fire-damp.

In the United States during 1906, of all the deaths in the coal mines, 11 per cent. were due to explosions of gas and dust. In this direction again, Europe is far ahead. The systematic testing of safety lamps and the thorough testing of all explosives have, for instance, so reduced the Belgian death rate from these causes that they are now but one-tenth of what they were thirty years ago.

Although natural conditions are more favorable for mining coal with minimum danger in the United States than in any other country, yet the number of men killed for each million tons of coal raised is shockingly high.

Comparative figures for 1905 and 1906 are:—

	1905.	1906.
Great Britain	4.64	4.31
France	4.17	....
Belgium	5.64	4.96
United States	5.97	5.57

Prussia alone shows a higher rate of fatalities.

It is distinctly cause for honest pride to note that Nova Scotia, Canada's principal coal-producing Province, has the lowest death rate per million tons of coal raised. For the sake of comparison we quote it:—

Nova Scotia, 1905, ... 3.96

The official pamphlet, referred to above, concludes by indicating the principal directions in which the work of investigation and control must proceed. These are, briefly:—

(1) The compulsory use of safety lamps in gaseous mines and the employment of relighting stations or of approved relighting devices.

(2) The use of permitted explosives in regulated amounted and the exercise of rigid control of the handling and storage of the same.

(3) The employment of competent certificated shotfirers.

(4) The introduction of rescue devices that will enable persons to enter mine workings immediately after a fire-damp disaster, or to combat mine fires.

(5) The equipment of all coal mines with the proper appliances provided for first aid to the injured.

(6) The provision of penalties incase of non-compliance with regulations.

WORKMEN'S COMPENSATION ACT.

F. W. Gray.

Apropos of an article that recently appeared in the Journal, the following statements may be of interest as showing the truth of the contention that the effect of the Workmen's Compensation Act, will be to kill the Friendly Societies in Great Britain. At a recent meeting of the Independent Order of Druids, the president said that the sick experience of the Society had exceeded all their expectations, but added that it was really not sickness as the result of loss of health they had to complain of, but sickness as the result of accident. The cost was 41 per cent. above actuarial tables, and had exceeded the expectancy by 44 per cent. The Society of Druids is composed almost exclusively of artisans, miners and steel-workers. The Rechabite Society is also feeling the same pinch. This is a temperance society and is composed of the more saving and religious class of workmen, but all the same the Compensation Act seems to have sapped the morality of its members. In the four years preceding the Compensation Act, £14 out of every £100 was paid in accident claims, and during the four years after the passing of the Act £28 out of every £100 was disbursed. The officers of these societies are now advocating the abolition of accident benefits. However, the truth is that under the Compensation Act as it is now drawn the occupation of friendly relief societies is gone, for under the grandmotherly legislation which is now making England the paradise of the working classes, the employer becomes general provider, friendly society and poor laws all combined in one poor individual.

A recent decision in the Merthyr (Wales) County Court has laid down the principle that where a miner is allowed free or cheap coal for household purposes, as is the case in many colliery districts, it must be reckoned in as part of his wages in adjusting claims for disablement under the Compensation Act. This decision has been appealed, and the final judgment will be one of much importance to colliery owners.

CANADIAN MINING INSTITUTE.

At the meeting of the Council of the Institute, held in Montreal on December 7th, a committee was appointed to make all necessary arrangements for a summer excursion in 1908, to include visits to the iron mines, steel works and coke ovens of Eastern Canada, including the Maritime Provinces, Quebec and Ontario. Invitations are to be issued to European engineers, especially interested in these industries.

The following new members were elected:—Thomas R. Drummond, M.E., manager Nipissing Mining Company, Cobalt, Ont.; Cosmo T. Cartwright, B.Sc., Trail, B.C.; Geo. H. Barnhardt, M.E., P.O. Box 687, Nelson, B.C.; Heinrich Ries, D.Sc., Professor of Economic Geology, Cornell University, Ithaca, N.Y.; W. E. Segsworth, M.E., 103 Bay street, Toronto; Chas. Merry, M.E., Ferguson, B.C.; F. N. Flynn, metallurgist, Cobalt, Ont.; R. R. Cormack, M.E., Le Roi No. 2, Limited, Rossland, B.C.; D. J. Browne, A.R.S.M., Le Roi No. 2, Limited, Rossland, B.C.; L. P. Silver, B.Sc., 420 St. Paul street, Montreal; W. H. Hannay, Le Roi No. 2, Limited, Rossland, B.C.; Robert H. Stewart, M.E., chief engineer, Consolidated Mining & Smelting Company of Canada, Rossland, B.C.; A. G. Hill, A.M.I.M.E., 168 Huron street, Toronto, Ont.; L. J. Lockwood, Cobalt, Ont.; L. B. Burns, 478 Front street west, Toronto, Ont.; W. A. Davidson, B.Sc., West Canadian Collieries, Limited, Blairmore, Alta.; W. R. Askwith, M.E., Haileybury, Ont.; Nicholas Richardson, M.E., general manager, North Atlantic Collieries, Port Morien, C.B.; James Hargreaves, M.E., superintendent, Reliance Mine, Taber, Alta.

Associates: Alfred Tarut, Outremont, P.Q.; N. P. Bryant, 84 St. Francois Xaxier street, Montreal.

Corresponding Members: C. B. Going, editor, "Engineering Magazine," New York; J. D. Kendall, consulting mining engineer, London, Eng.

BOOK REVIEWS

MINING, MINERAL AND GEOLOGICAL LAW. A TREATISE ON THE LAW OF THE UNITED STATES, INVOLVING GEOLOGY, MINERALOGY AND ALLIED SCIENCES, ETC., ETC. BY CHAS. H. SHAMEL, M.S., LL.B., A.M., PHD., OF THE ILLINOIS AND MICHIGAN BARS. HILL PUBLISHING COMPANY, 505 PEARL STREET, NEW YORK. PAGES, 627, 6 x 9. OVER 100 ILLUSTRATIONS. BOUND IN DURABLE BUCKRAM, WITH LEATHER LABEL. $5.00 POST-PAID.

The value of a knowledge of mining law is readily acknowledged by mine owners and operators. Litigation, as costly as it is useless, is often plunged into by mining men ignorant of the alphabet of mining laws of their country.

Very few text-books exist on the subject. The Canadian works of McPherson and Clark on "Law of Mines in Canada" and Justice Martin's "Reports of Mining Cases" are not designed as guides to the laity. Indeed, Canadians need just such a treatise on Canada's laws as Dr. Shamel has written on the mining legislation of the United States.

It will convey some conception to the reader's mind of the design and comprehensiveness of Dr. Shamel's book if we mention a few of the sources from which he has drawn his information.

Dr. Shamel's first acknowledgement is made to Professor James F. Kemp, the head of the geological department of Columbia University. Of Dr. Gratan, Professor of Paleontology at the same seat of learning, grateful mention is made by the author. Numerous other professors of metallurgy, chemistry, mineralogy, etc., are thanked for assistance. The writings of Dr. Rossiter W. Raymond, the distinguished and learned secretary of the American Institute of Mining Engineers, are also specifically mentioned.

From these and other specialists and scholars information and help have been derived. All the standard text-books Dr. Shamel called into requisition. In his preface he advises his legal brethren to read Chamberlin and Salisbury, Kemp, Graban and other technical writers, that they may thus equip themselves to expose the pseudo mining experts, who "cloak their own ignorance by a profuse flow of misused technical terms."

The principal chapters of the book deal with these title subjects:—

Geology and Allied Sciences—Definitions.
Property in Minerals.
Legal Definitions of Mineral and Ore.
Theories of Ore Formation and Classification.
Right of Extralateral Pursuit of Vein.
Public Domain and Mining Laws Applying.
Acquisition of Mining Rights.
Scientific Definitions of Veins.
Legal Definition of Vein or Lode.
Miscellaneous Uses of Geology in Law.

American (United States) writers are proverbially inaccurate in their references to Canada and things Canadian. It does not flatter us to notice in an appendix that The Canadian Mining Journal is given an incorrect address. Despite Dr. Shamel, the Journal is published in Toronto, not in Ottawa.

In conclusion, we cannot refrain from expressing our astonishment at the author's familiarity with modern mining, metallurgical and geological literature. The task of co-ordinating so vast a bulk of heterogeneous facts must have been Herculean. Its successful accomplishment implies that the author is thoroughly familiar with several exact and several speculative sciences, has a working knowledge of the professions of the mining engineer and the metallurgist and, in short, is both versatile and erudite.

RECENT CYANIDE PRACTICE. EDITED BY T. A. RICKARD. FIRST EDITION. PUBLISHED BY "THE MINING AND SCIENTIFIC PRESS," SAN FRANCISCO, 1907. PAGES, 334.

This volume is a judicious compilation of articles on cyanide practice. The writers are men of unquestioned standing. Under Mr. Rickard's careful handling "The Mining and Scientific Press" has become the battle ground of experts for the threshing out of problems in this branch of metallurgy. The utterances of Mr. Rickard himself may be taken as *ex cathedra*. He is, in the opinion of many, better qualified to speak upon all phases of cyanide practice than any other metallurgical engineer.

Hence the book before us has every claim to merit.

The range of subjects covered is a wide one. Fine grinding, filter press practice, cyanidation of concentrate, re-grinding, assay of cyanide solutions, tube mill lining, tube milling in Korea, the action of oxygen in cyanide solutions—these are but a few of the topics treated. All of the articles are reprinted from "The Mining and Scientific Press," and, in this form they constitute an excellent *vade mecum*.

While in every compilation of this sort there must of necessity be bare spots, yet because of the variety of subjects touched upon and the constant change in diction and viewpoint, "Recent Cyanide Practice" is more desirable than the average handbook. One can open the book anywhere and start reading without reference to any other section.

For instance, opening at page 296, we find an article by T. A. Rickard, entitled "Old and New Methods at Guanajuato, Mexico." As outlined here, one of the Guanajuato problems was the conveying of the tailings from the cyanide plant to the river, one mile away. This was effected by means of a cast iron sewer pipe at grades of 3 per cent. and 2 1-4 per cent. As water was a not too plentiful commodity, the tailings were fed to the waste pipe with as small an amount of water as possible. Experiments proved that at a dilution of 2.5 of water to 1 of sand the pulp would flow rapidly without clogging the pipe. Normal dilution, the condition of the pulp when leaving the concentrator tables, was found to be about 8 to 1.

Opening again at random at page 198 we read in a paper by Alfred James, reviewing progress in cyanidation during 1906, that the use of coarser screens in stamp mills, the separation of the coarse product from the slimes and the regrinding of the former was a growing tendency. African tube mill costs were reduced from 8 1-2d. per ton ground to 5 1-2d. On hard ore a duty of slightly more than 2 tons per day per horse-power appears to be an average. Tube mill practice generally has improved the extraction by amalgamation from 5 per cent. to 7 per cent. and has saved 75 per cent. of screening expense.

The book is replete with practical working results and modern instances such as the above. Naturally, it is cosmopolitan in the variety and character of the articles included.

As a handy reference book it will supplement admirably the more exhaustive standard works. It is, of course, much more up-to-date than any text-book, written by a single author, could possibly be.

The omission of certain little personalities between two authorities on cyanidation would not have detracted from the value of the book.

We notice, with a feeling of respectful unease, that Mr. Rickard has carried into practice his reforms in terminology. Completely as we may bow to the distinguished editor's judgment in these matters, it may still be allowed us to protest that "concentrate" does not fill one's mouth half as satisfactorily as does "concentrates." Similarly, "tailing" and "slime" sound quite as unfinished as they look.

EXCHANGES.

South African Mines, Commerce and Industries, in its issue of October 26th alludes to the desirability of developing Canadian trade with South Africa. Already Canada buys South Africa's minerals. Tobacco may soon be added to the list. In return, it is pointed out, Canada may sell her mining machinery to South Africa. Canada now produces the best agricultural machinery in the world.

The *Iron and Coal Trades Review*, December 6th, discusses lucidly and forcefully the outlook in Germany. "A great many of the enterprises there [Germany], while profitable enough, are of quite recent origin, and there has been no time to form reserves. The majority are financed by the banks, which in a crisis would probably become anxious and call their money in, with disastrous results to the borrowers. In fact, the great business fabric, which the Germans have raised with so much perseverance, ability and courage, is based to what many economists consider a dangerous extent upon credit, and if that credit should be seriously disturbed disaster

Writing of the Monangah disaster, the *Mining World* refers to the laxness of the larger coal mines of West Virginia in carrying out the letter of the laws for the prevention of accidents. In August last the new mining law went into effect in West Virginia. By its provisions safety lamps must be used in gaseous mines; powder must be carried in five pound canisters; solid shooting may be done only as directed by the Inspection Department; doors must be avoided in gaseous places; and not over 60 persons are allowed in any one split.

The *Colliery Guardian,* December 6th, alludes editorially to safety lamp relighters. The necessity of minimizing loss of time in relighting is emphasized. Lamps burning mineral oil are especially liable to become extinguished in a strong current. There are strong objections to the use of either fulminate or yellow phosphorus as a relighter. Particles of the former may penetrate their way through even a double gauze and cause an explosion; while the viscous phosphorus, by coating the glass, causes a loss of light. The subject is a most important one and is engaging the attention of Continental and English experts.
might easily follow. In this respect, therefore, we have an important advantage over Germany, while our national finances are in a much better position, the necessaries of life are cheaper, and altogether we have much less to fear from a reaction in trade or stringency in the money market."

In an editorial entitled "Treatment of Silicious Ores," the *Mining and Scientific Press* points out that the problem of treating high grade silicious ores will solve itself. "In every camp the growth of mining and the development of individual mines leads to a lowering of the assay value of the average output. Cripple Creek and Kalgoorlie, the two great gold fields of the last decade, were high grade camps during their early years. Cripple Creek shipped its rich silicious material to the Denver and Pueblo smelters, while at Kalgoorlie the mills extracted the gold at a cost not a bit less than the usual smelter rate. In the course of time some of the high grade ore bodies were exhausted, and the output became less rich, per ton, simply because a general cheapening of operations enabled the managers to exploit ore bodies formerly unprofitable, and to mix the poorer stuff with what remained of the bonanzas. As much profit was made on medium grade ores as was made in the early stages of mining from the high grade product. At Goldfield the bonanzas yet remain, in large part, but steady improvement in methods of mining and milling will gradually eliminate the smelter problem. Cyanidation on the spot will follow in the wake of smelting at a distance. History repeats itself."

An article entitled "Mining in Norway" appears in the *Mining Journal* (London) November 30th. The writer is Joseph Ralph. Among other companies operating in the north of Norway is a Norwegian-American company. Their property, the Varanis copper mine, has been but recently opened. The ore carries 5 per cent. of copper. Concentration is effected by the Elmore vacuum system. Referring to Norway's reactionary legislation of 1906, Mr. Ralph states that, although Norway merely intended to prevent charter mongers from securing a monopoly of her water powers, the law passed by the Norting is a barrier to all foreign investors. No foreign mining company can secure a mining concession in Norway unless its operations are governed by a board sitting in Norway and controlled by Norwegians. Under the contract system of mining in Norway the miner, for the first fortnight, may be discharged without notice. After this period he is entitled to fourteen day's notice and can claim his wages for that length of time, no matter how little work he has done, so long as he has not positively refused to work. A striking feature of the Norwegian mining law is that, on the complaint of any discharged miner, as regards the safeness or unsafeness of working conditions, the Government inspectors will visit a mine and examine it. This is the cause of very grave abuses.

PERSONAL AND GENERAL

Mr. A. C. Garde, of Nelson, B.C., has been appointed manager of the La Plata Mines, Limited, in that neighborhood.

Mr. R. G. Drinnan, of Fernie, B.C., has been appointed general superintendent of the Pacific Coal Company at Hosmer.

Mr. L. Rameau, a French engineer, has been appointed manager of the West Canadian Collieries, Limited, at Blairmore, Alta.

Mr. C. P. Nash, of St. Paul, Minn., recently visited Vernon, B.C., on business in connection with the rehabilitation the Cherry Creek Mining Company.

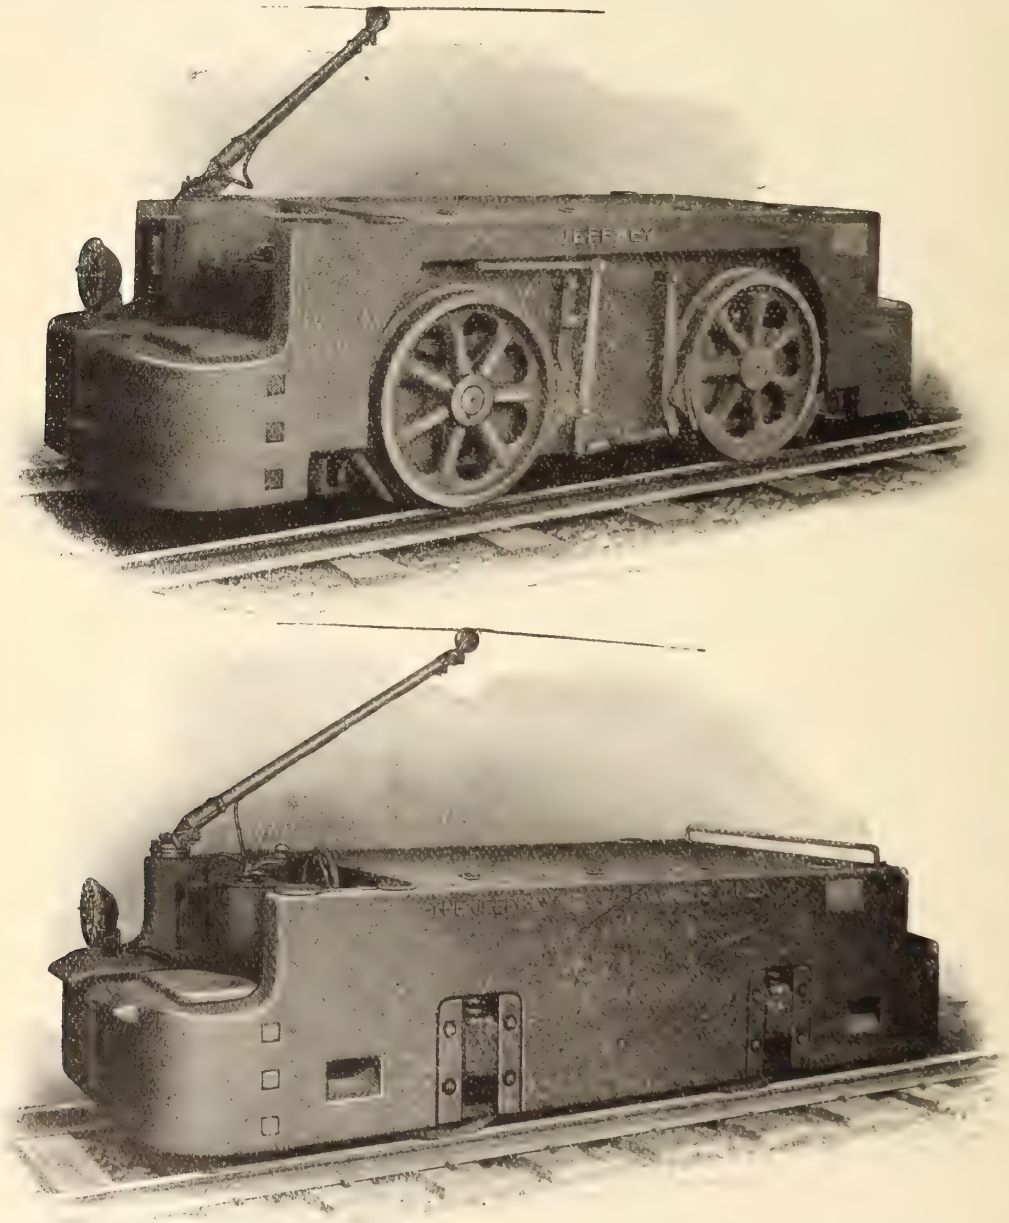
Mr. A. I. Goodell, formerly manager of the Northport smelter, Wash., has been appointed manager of the Sullivan Company's lead smelte rat Marysville, B.C.

Mr. G. F. MacNaughton, formerly manager of the Fifteen Mile, Blue Nose, Cochrane Hill and other Nova Scotian gold mines, has accepted the position of manager of the Trethewey mine, Cobalt.

Mr. J. C. Haas, a well-known mining engineer of Spokane, Wash., has been retained by a Philadelphian syndicate to examine and report on a group of copper claims an Lynn Creek, near Vancouver.

Mr. O. E. S. Whiteside has resigned the managership of the West Canadian Collieries, Limited, at Blairmore, Alta., to accept the general managership of the International Coal Company, at Coleman.

Mr. H. H. Claudet, of Rossland, has been visiting Golden, where he is directing the installation of an Elmore vacuum oil plant, having a daily capacity of forty tons, at the Giant mine. It is expected that the plant will be completed and in operation within two months' time.



At Whithorse last month Capt. John Irving, who has identified himself with mining in that section, was tendered a complimentary dinner by the residents of the town, "in appreciation of his unceasing efforts to make of this district one of the most promising mining camps of the great Northwest."

Mr. A. N. Galer, who recently retired from the general managership of the International Coal Company, operating at Coleman, Alta., was banqueted by the staff at Nelson last week, and presented with a testimonial in mark of appreciation and esteem on the part of his subordinates.

It is stated that appeal will be taken to the Privy Council of the now celebrated mining suit of the Star M. & M. Company vs. the Byron White Company, to determine the ownership of veins of high grade ore encountered in the development of the Rabbit's Paw claim in the Sandon district, B.C. The case hinges on the defendant's privileges under the old law of extralateral rights.

A circular issued by Mr. C. E. Rhodes, president of the Institution of Mining Engineers, Newcastle-upon-Tyne, England, announces the sudden death, which occurred on the 22nd ultimo, of Mr. M. Walton Brown, who since 1891 has acted as secretary of that Institution. Mr. Brown had a number of friends in Canada who will regret his loss. The announcement is made that Mr.Percy Strzelecki will act as secretary pro tempore.

The pioneers of the Bishop, Inyo County, California, realizing the services rendered to the prospectors of early days by the patient and hardy burro, have decided to raise a monument in testimony thereof. A life size representation of the burro is hence to be cast in bronze, and on the pedestal will be inscribed: "In acknowledgement of the debt of gratitude from the mining industry of the world to the burro, whose sagacity, patience and endurance have made possible great achievements in mines and finance. This tribute of tardy justice has been erected by the miners of the Bishop Mining District." And it may be added that statues have been erected to the memory of the less deserving though possibly greater asses.

NEW MACHINERY.

The accompanying illustration show recent types of electric mine locomotives as built by The Jeffery Manufacturing Company, of Columbus, Ohio. The designs embody the latest ideas in mine locomotives and street railway motor construction. Every part has been made amply strong and simplified as far as possible without eliminating any of the desirable features. The design is such as to secure the smallest over all dimensions and at the same time allow access to all of the parts. The motors represent the latest ideas in railway practice, such as drum armatures with form wound coils, laminated pole pieces, ribbon wound field coils impregnated with solid compound, oil lubrication with auxiliary grease boxes, and liberal wearing surfaces. The magnet frames are arranged so that the complete motor may be removed from the locomotive by taking off the axle caps, or the frame can be taken apart and the armature removed with very little trouble.

The inside wheel type is to be preferred where the mine entry is wide enough to accomodate the increased width; as the wider locomotive allows more space for the electrical equipment and consequently easier access to the motors, rheostat, controller, etc.

SPECIAL CORRESPONDENCE

NEW BRUNSWICK.

ST. JOHN.—The Drummond Mining Company have great confidence in the future of the iron industry at Bathurst and are now planning to develop the big deposits near that place, which they have recently taken over.

It has been learned that the Provincial Government has given assurance of all reasonable aid. The company will be granted a New Brunswick charter in the course of a few weeks. Diamond drills will be put on the property this winter, mining will be under way early next year and in two years from now, it is expected that 100,000 to 150,000 tons of ore will be annually produced.

It is difficult to say just at present, how many men will be employed, but there should be work for 250 or 300 when the mine is in full operation, and many others will find occupation in other lines developed because of the mines. This is no speculation but a business proposition. The ore deposits are rich and there are some millions of tons of ore in sight.

Mr. John J. Drummond, of the Drummond Mines Company, was in St. John recently, accompanied by Mr. F. C. Parsons, the company's engineer. They had interviewed the local Government, placing their proposition before Hon. Mr. Robinson and his colleagues.

They asked the Government for the right to take power from the Grand Falls of the Nepisiquit River, for conducting their mining operations and for sufficient land actually necessary for their buildings. Mr. Drummond, in putting forward the proposal, said that the company asked only to develop the power along lines to be approved by the executive council and should it be necessary to dam the river, it would be done so as to conserve the power. The plans for the dam and other works would be submitted to the Government for approval and the dam would be so arranged as not to interfere with the work of the lumbermen, or with the fishing interests. The company also asked for surface rights in fee simple on 640 acres over the iron deposits and a grant of 3,000 acres of timber land, under the Mining Act, for mining purposes only; all of the merchantable timber on the property has already been cut over, and the company hopes to be able to make satisfactory arrangements with the lumbermen holding leases. Mr. Drummond also pointed out that the Drummond corporations would be able to use all the ore produced by them at their own blast furnaces.

From $150,000 to $200,000 would be expended in starting developments. Relative to Londonderry, he said they had promised to expend $150,000 there, and now had $1,000,000 to invest in the place. He would not assert positively that blast furnaces and steel works would be established at Bathurst, but said that the natural order of things was that a blast furnace followed upon iron ore mining and that a blast furnace led to steel works. The Drummond corporations, he said, have industries in several places in Canada, and at the outset, the ore raised in Gloucester county would be shipped to supply these. But the output would soon be more than required and there would be shipments of ore to the United States and the old country, as the market offered.

With blast furnaces and steel works established at Bathurst and the mines in operation, he said, probably 1,000 men would find work as a result of the development of these deposits. The I. C. R. is arranging to run a branch line to the mine, and to tide water at Bathurst, and harbor. Stores would of course follow the development, and in all it meant much for Bathurst and, indeed, for the entire province.

The New Brunswick business will be practically in charge of Mr. Drummond and his brothers and the estate of the late Dr. Drummond.

Advices from Campbellton are to the effect that a company of Miramichi men, headed by James Robinson, ex-M. P., intend developing an iron property in Gloucester County adjoining the Burns property, and owned by W. E. Fish, of Newcastle.

The property is believed by those interested to be fully as valuable as that now controlled by the Drummond people, and is five miles in length.

Messrs. James S. Gibbon, Charles S. Gibbon, William E. Vroom and N. S. Springer, of St. John, and Charles I. Spasker, of Newcastle, are incorporated as the "Winter Port Coal Mining Company," with a capital of $99,000. The object is to acquire certain lands of the Messrs. Gibbon, fronting on the Grand Lake, for carrying on a coal mining business.

The quarrying of limestone, which used to be an important industry in the vicinity of St. John, has every appearance of reviving. William Ryan, of Brookville, is quarrying on quite a large scale, the product of the quarrires being sent to points on the Miramichi, for use in the pulp mills.

Information from Hopewell Hill is to the effect that James Blight, of Hillsboro has a crew of men at work at the old plaster quarry near the village. This quarry was worked about seventy years ago or more, when a tram road carried the output to the shore, where it was placed aboard small schooners. J. E. Dickson was among those interested in the quarry at that time, but the work had to be abandoned on account of the heavy expenditure involved in keeping the quarry drained. The plaster is of a good quality and to be found in large quantities.

The Dominion Iron & Steel Company in addition to leasing the property of the New Brunswick Iron Company, have purchased 2,000 shares of the company's treasury stock, at $25 a share.

They will bear the entire cost of the work of development which will involve a very large expendiutre.

As stated in the last issue of the CANADIAN MINING JOURNAL, Axel Andenberg, the expert mining engineer, went to Lepreaux late in November, and has since made a thorough examination of the property, which will be opened up on a large scale. The Iron & Steel Company's representatives are now on the ground. The ore, which is magnetite, is said to be equal in quality to the celebrated Swedish ore, being very high in iron and very low in sulphur.

There could be no better indication that the proposition is one of big value, than the fact that the Dominion Iron & Steel Company have taken hold of it, and, with their immense resources a great industry will no doubt be built up at Lepreaux. The logical outcome is the erection of smelting works and the manufacture of iron at the seat of production.

The New Brunswick Iron Company had expended some $40,000 on the property, but owing to lack of capital were obliged to abandon the work about a year ago. The Dominion Iron & Steel Company have been aware of the value of the deposit and only awaited an opportunity to interest themselves in it. Their lease is for eighty years.

Mr. Andenberg has for the past year been engaged with the Lackawanna Iron Company, at Lebanon, Pa., and resigned his position to go with the Dominion Iron & Steel Company, when they leased the property.

The directors of the New Brunswick Iron Company, are James F. Robertson, St. John, N.B.; J. S. MacLennan, Sydney; E. P. Jones, manager of the Dominion Iron & Steel Company; F. A. Crowell, Sydney! and C. V. Wetmore, also of Sydney. Mr. Wetmore is president, Mr. Crowell, vice-president and Peter Clinch, of St. John, secretary-treasurer.

A writer of old times notes, published in a St. John daily, refers to an item from the "Miramichi Gleaner" of June 2nd, 1838, showing that the mining area in Gloucester County, which was recently procured by representatives of the Drummond Mines Company, of Londonderry was known to exist and was developed to some extent by an English company at that time. The item referred to reads as follows:—

"Gloucester Mines.—Mr. Stevens, the gentleman who has purchased the privilege of working the mines in this country, and who proceeded to Great Britain last fall with several specimens of ores, which he had collected, arrived in the Queen, accompanied by a number of miners, for the purpose of prosecuting his researches. They proceeded to Bathurst in the steamer Cape Breton on Monday last. Mr. Stevens has been so far successful in the mother country as to form a company, with ample capital to work the mines, should the ore on further inspection prove sufficiently rich and abundant. The specimens of copper ore, more especially which he procured, we understand are unusually rich."

On Saturday, December 7th, Dr. A. O. Earle, K.C., engaged as commissioner, took the evidence of Peter Clinch, secretary of the New Brunswick Iron Company, in a suit in connection with that company.

The suit is between Mr. Charles W. Young, of St .Stephen and Mr. C. V. Wetmore, of Sydney. Both were directors of the company and in order to raise money for development work, these gentlemen endorsed notes for the company. When it became necessary to take up these notes Mr. Young became responsible for paper to the amount of some $3,000 and Mr. Wetmore for about $6,000. Mr. Young now seeks to hold Mr. Wetmore liable, and Mr. Wetmore in a counter-claim contends that Mr. Young should share in the $6,000 for which he became responsible. Hon. H. A. McKeown is acting for Mr. Wetmore and L. P. D. Tilley for Mr. Young. The evidence of Mr. Mr. T. B. Blair, manager of the St. John branch of the Royal Bank, of Canada, was taken by Mr. Belyea on Monday, December 7th.

ONTARIO.

Cobalt.

City of Cobalt Mining Company.—One car of No. 1 ore and one car of No. 2 ore were shipped to the American Smelting & Refining Company on November 13. Their weights were 37,000 pounds and 64,000 pounds respectively. The No. 1 will probably run 4,000 ounces per ton and the No. 2 400 ounces per ton. The shaft is now down 125 feet and will be sunk to 150 before the second level will be started.

Trethewey.—A car of first class ore was shipped from here to Copper Cliff on December 8th, weighing 60,000 pounds. This will probably run 3,000 ounces to the ton.

The No. 2 shaft is now down 95 feet.

Coniagas.—3 cars have been shipped this month. One of ore, one of mixed concentrates and ore, and one of concentrates.

Green Meehan.—This property has closed down temporarily while the compressor is being repaired.

Elk Lake.—The winter road from Earlton to Elk Lake was completed on December 19th, and by Xmas the stage will be making regular trips.

Silver Leaf.—The shaft sunk on the new vein is now down 58 feet. Here there are 5 pay streaks. The general average across the vein is better here than it has ben at any othr point.

On Thursday, December 19th, the La Rose Mining Company, put up bonds to ensure payment of $168,000, the amount awarded to the Right of Way by the commission of engineers who examined and sampled the drift from which the ore was taken, subject to the decision of the Courts respecting title.

All the parties concerned have accepted the decision of the engineers.

A remarkable proof of the correctness of their estimate is the fact that immediately after the estimate was made, 2 cars of ore were shipped from the drift sampled and the returns were within 5 ounces of the estimated value.

Muggsley Concentrator.—Work on this concentrator is proceeding very satisfactorily. It is expected that they will be ready to crush in February or March. The mill will handle 100 tons per day of the low grade ores of the camp, by what is known as the combination process of silver mining, which consists of concentration, pan amalgamation and cyaniding. The concentrator consists of jigs to take out the coarse native silver and smaltite. The entire jig tailings will be crushed by stamps and the product classified by a Richards classifier. This spigot or coarse material, will be treated on Wilfley tables, the overflow of the classifiers going into tanks. The product of the tanks is treated on Frue vanners. The tailings of both tables and vanners will be treated by cyanidation and pan amalgamation.

The company are convinced (having made a number of practical tests) that to treat the ores of this camp successfully, something more than simple concentration is necessary. They intend to separate as much as possible, the native silver from the cobalt and niccolite, retorting and melting the silver at the concentrator.

The American Smelting & Refining Company have now a local reprepresentative in the camp, who is attending to the shipments to the various plants of the company, and also purchasing ore. In speaking of the difficulty of smelting cobalt ore in quantity, he says, "This ore is difficult to reduce and can only be used in small quantities, so it is common for smelters to be overstocked. To avoid this and to prevent delays to shippers, the company are now receiving carload lots at their different plants, notably at Perth Amboy and Denver, and are prepared to receive this ore at Chicago, Omaha and Pueblo.

The high grade ore is paid for by us, in cash, as soon as the ore is run into the silver bars. The low grade is cash at thirty days.

ALBERTA.

Edmonton.—Owing to the continued mild weather the price of coal has dropped from $4.00 per ton to $3.50 per ton.

There is quite a glut of coal on the local market due to the "farmers' mines" as the numerous small mines in the district are called, opening up for the winter trade. There has practically been no snow yet and the thermometer has never yet reached the zero point this winter, hence the consumption of domestic coal has not been large enough to take up the production.

The Edmonton Board of Trade has issued a statement regarding the coal mines in the Edmonton district. This statement gives the number of mines as 26, with a daily output of 2,620 tons. Edmonton during last winter exported coal to Winnipeg, Dauphin, Prince Albert, Saskatoon, Regina, Battleford, Vermilion, Vegreville, Daysland, Wetaskewin, Calgary and intervening points and is doing the same this winter.

The name and location of the various mines in the Edmonton district according to the records of the Provincial Government are as follows:—

Crafts & Lee, Tofield; Byers Bros., Cloverbar, 8-53-23.4; C. G. Carnegie, Namao, 17-55-25.4; C. F. Carnegie, Namao, 4-55-24.4; Connell Spencer Coal Company, Namao; Cardiff Coal Company, Edmonton, 25-55-23.4; Daly & Lindsay, Cloverbar, 7-53-23.4; Edmonton Coal Company, Edmonton, 18-53-23.4; Edmonton Standard Coal Company, Edmonton; Fraser & Freeman, Strathcona; Frank Coal Mine Company, Edmonton; Wm. Humberston Company, Edmonton, 7-53-23.4; P. F. Ingram, Tofield; Keith & Dulton, Cloverbar; Ketchum Coal Company, Cloverbar; Lindsay Bros, Namas, 9-55-24.4; John Milner, Edmonton; Milner-Benner Coal Company, Edmonton, Bush Mine; Rosedale Coal Company, Edmonton, R.L. 28-30; P. Otewell, Cloverbar, 17-53-33.4; Parkdale Coal Company, Edmonton; Strathcona Coal Company, Strathcona; United Collieries Ltd, Edmonton; Western Coal Company, Edmonton, 7-53-23.4; Watson Bros., Namao, 16-53-24.4 and White Star Mine Company, Strathcona, 25-51-25.4.

Geo. H. Shaw, traffic manager of the Canadian Northern Railway, when on a recent business trip in the Edmonton district, in speaking of the coal mines, said: "At the Morinville mine, about 20 miles north of Edmonton, they have a shipping capacity of about 750 tons daily. Other mines around Edmonton have at present a shipping capacity of 250 tons daily. As yet these mines are being worked on a small scale, but there is a great future before them, and the coal is good. We have enough power and cars to take the fuel away as fast as it is ready for shipment. It is taken south as far as Calgary and east as far as Regina, and in fact almost to the border of Manitoba.

STRATHCONA.—For some time past there has been a slight difficulty between the Strathcona Coal Company and their employees, resulting in an application being made to Ottawa for a Board of Arbitration to be appointed under the Lemieux Act.

The miners in the employment of the company belong to the labor organization of the United Mine Workers of America. The men are paid a lump sum of 90 cents per ton for all coal mined, this price to cover timbering and car pushing. The men want extra remuneration for car pushing, over and above their tonnage rate. The company claims that if car pushing has to be paid for then the tonnage rate will have to be reduced.

FRANK.—During the past week examinations held by the Examining Board of the province has been conducted at Frank for the purpose of examining candidates for 1st, 2nd and 3rd class certificates of competency to act as coal mine officials. Over 40 candidates presented themselves for examination. This is by far the largest number of candidates ever examined at one time in the province, and is a clear index of the growth of the coal mining industry along the Crow's Nest branch of the C.P.R.

The examining board consisted of the two Provincial Mine Inspectors and two other members—one representing the miners and the other representing the operators in the province. These examinations are held yearly, according to the Coal Mines Regulation Act. Before anyone can become a mine official in Alberta, it is necessary that he shall hold the proper Alberta certificate of competency, qualifying him for such position. Certificates from Great Britain, United States, or from other provinces in the Dominion are not recognized, and all mining officials must take the Alberta examination, no matter what their other qualifications may be.

LEZHBRIDGE.—The Board of Arbitration appointed under the Lemieux Act to investigate the dispute between the Alberta Railway and Irrigation Company and their employees in the Galt mine, has given its decision in favor of the company. It will be remembered that the point in dispute was the interpretation of a clause in the mine workers agreement, as to whether a pony driver should be paid from the time he harnessed his horse or from the time he commenced to haul coal.

Although the Board found in favor of the company, General Manager Naismith announced that the offers made to the men previously will still hold good. By agreement the men will work eight hours at the place of work, but will be allowed pay for half an hour extra for the time spent in going to and from work.

TABER.—The Arbitration Board investigating the disputes between the operators and miners in this district is being held in obeyance for the present, as there have been changes in the management of some of the mines, and offers are being made to bring about a settlement with the new managers, without having recourse to arbitration.

SASKATCHEWAN.

REGINA.—Representatives of two of the largest coal firms in the province—Whitmore Bros. and Smith & Ferguson Company are back from a trip to the mines at Bankhead, near Banff, Alta, and the Galt miners at Lethbridge, and confirm the report of a possible coal shortage this winter. Both representatives state that the mines are running half shift, owing to the scarcity of skilled labor, and that the present supply is only about equal to the demand during the mild weather. One firm is now completely out of coal in the city, and the mines cannot fill orders. With cold weather for a few days suffering from lack of fuel would be distinctly felt throughout this province.

The C.P.R. officials at Winnipeg state, however, that hundreds of farmers in Manitoba and Saskatchewan, especially in the districts which suffered most last year, have a year's supply of coal in their barns now, and this will relieve the situation to a great extent.

SASKATOON.—When coal was discovered a few months ago near Eagle Lake the Provincial Government sent out an expert to examine and report on the quality and quantity of the mineral. The report they received was to the effect that the coal was a lignite, and although continuous over a considerable area was rather thin.

On receipt of this report the Provincial Government approached the Department of the Interior, at Ottawa, with a view to securing a coal field at Eagle Lake. Arrangements have now been completed between the two Governments, and the Provincial Government has undertaken to open up and work a mine on the property, to supply the needs of the settlers in the surrounding country.

The Eagle Lake district lies about 60 miles, in a westerly direction, from Saskatoon, and is entirely devoid of timber except for a small patch of scrub here and there. Last winter the settlers experienced great hardships for lack of fuel. The roads were all blocked with snow, and even when fuel was obtained at railway points it could not be hauled in. Saskatoon is the nearest railway centre to the coal fields. The only other known coal being worked in the province at the present time, is in the Souris Coal Field, which lies in the southeast corner of the province. Here too we find a lignite coal, but the veins are all of a fairly good thickness, and are fortunately situated close to the Soo Line and its branches.

The Provincial Government have secured the services of Mr. J. Davies, who is a prominent Welsh mining engineer, and has been in the West for some time, in the interests of Welsh capitalists, who have invested heavily in coal lands in the Crow's Nest Pass.

Mr. Davies is at present in Saskatoon procuring the necessary wagans, tools, timber and labor, and when he has his outfit ready will proceed at once to Eagle Lake and commence mining operations. Mr. Davies will bring to bear on the work a long experience as a colliery manager and mining engineer in Great Britain. There will be a considerable difficulty experienced in obtaining the necessary timber for roof supports in the mine, as there is no timber grown in the neighborhood, and all the mine props will have to be hauled a distance of 60 miles in wagons, from Saskatoo, which is at present the nearest railway point.

BRITISH COLUMBIA.

Things have gone smoothly during the past two weeks with the Rossland mines and nothing of an unusual nature has cropped up. The men seem satisfied with the wages they are now receiving, and the mines are shipping good quantities of ore. The Evening Star mine has been leased by a local man, and from the present outlook it is hoped by the lessees to ship about 1,000 tons of ore from that property during the next six months or so. A car of ore has already been shipped. There is some talk of one or two of the other small properties being taken up and worked under lease. Those who have leased the smaller properties around this camp, heretofore, seemed to have lost interest after shipping a car or two of ore, and have invariably stopped work. The fact of the matter is, it takes a lot of money and work on a large scale to handle the low grade ores of this camp, at a profit.

For the week ended December 14th, Consolidated Company shipped 4,235 tons; Le Roi 2,555 tons; Le Roi 2, Limited 630, total for week 7,420; for year to date, 259,579 tons, of ore.

In the Boundary Country the issue of the day is the stand the miners have taken in the matter of a reduction of wages by the Granby Company. As mentioned in last letter, the Granby Company posted notices that they would begin work December 5th, and would pay the same scale of wages then prevalent in Rossland, Butte and elsewhere; that is $3.50 for miners, $3.00 for shovelers, for eight hours; blacksmiths $4.00. carpenters $3.50 for nine hours, and so on down the line. On December 7th, the whistles blew at the Phoenix mines as a signal of the resumption of work but none of the miners applied for their old positions at the lowered wage scale. It is stated that about forty men presented themselves at the smelter, at Grand Forks, and that around twenty were put to work. Since that date many different statements have been made, contradictions were published, meetings of the miners and smeltermen, have been held, the business men have had convocations, the mine owners have been approached by various interests, but despite all this, up to the time of this writing the situation was just about where it was on the seventh instant. While there is no particular ill feeling manifested it is thought that if the Granby Company bring men in from the outside to work their propererties, that there will be more or less friction. However, everyone in the Boundary district is in hope of an amicable settlement being reached, probably before this article is published.

Mr. Wm. Waldie, of the Queen mine, in Ymir district, who has recently purchased an addition to his stamp mill is now about to place a larger hoisting engine and a twelve drill compressor on his property. The mine is looking better than it has ever before.

The people who have the Hewitt mine, near Silverton, under bond are showing great activity and have placed orders for compressor plant, machine drills, etc. There is lots of ore in sight in the mine and as soon as possible an output of about 100 tons per day will be made.

Work is proceeding steadily on the Vancouver, which belongs to Le Roi 2, Limited, Rossland, and the Wakefield, in the same district.

La Plata mine, above Kokanee, is now milling 375 tons of ore per week. Mr. A. C. Garde is in charge of the property at present. Mr. Garde is also superintending the work being done on the Argenta.

The St. Eugene mines and the coal mines along the Crow's Nest Line are working industriously and making a good output. There is an over abundance of labor along "The Crow" just now, but the coal mine operators claim that there is no abundance of cars for coal. New strikes of very good coal of bituminous and semi-bituminous grades are reported regularly. One can hardly realize the amount of coal there is in the Crow's Nest district. The fact is the whole country there is traversed by seam after seam of good coking and domestic coal.

The wave of financial disturbance has not hit this country very hard so far. Money seems plentiful and most of the men now out of work have sufficient capital ahead to carry them over until spring, when it is hoped that the mining, lumbering and other local industries will be running full force again and, if anything, that conditions will be on a better basis than heretofore.

NOVA SCOTIA.

Glace Bay.—On the 5th December immediately after our last fortnight's correspondence was written, the Dominion Coal Company posted the schedule of revised rates then referred to. The company's notice read as follows:—

DOMINION COAL COMPANY, LIMITED.

The present Three Years Contract with our mine workers of the P.W.A. terminates 3rd JANUARY, 1908.

SCHEDULE ONE shows rates and conditions that will come into effect on the termination of the present contract unless a new contract is made.

SCHEDULE TWO shows the ADVANCED rates offered if a NEW CONTRACT is made on or before 16th December, 1907.

THE ADVANCE is offered for the sake of having a CONTRACT BY 16th DECEMBER on which to base our programme and sales, and after that date a new contract will not be discussed nor will any advance be made in the aggregate outlay for labor called for by Schedule One.

The offer of the advance in Schedule Two is made WITHOUT PREJUDICE TO OUR RIGHT to establish Schedule One if the offer is not accepted.

G. H. DUGGAN,
2nd V.P.

The Schedules are too long to reproduce here, and in detail they have only local interest. Briefly the alterations proposed are as follows. The machine cutting rates show the following increase:—1 1-2 cent per ton at No. 1 Colliery and No. 7, and 1 cent per ton at Reserve. Reductions are Nos. 3 and 4 mines, 6 cents and 1 cent at No. 9. The loading rate is increased by about 3 cents per ton at all the mines. All pillar rates are reduced 4 1-2 cents. Mine mechanics and shiftmen getting over $1.65 per day are to be increased 3 per cent. The rate of day wages for laborers now $1.38 will be made, minimum $1.38 maximum $1.52, men to be graded by managers.

Under Schedule 2 no reductions are made in machine cutting rates, and the following increases are shown, No. 1 and 7 mines 2 cents, reserve 1 1-2 cents, No. 2 mine 3 cents, Nos. 6 and 9 mines 1-2 cent, Nos. 3 and 4 no change. Loading rates are increased as follows:—No. 1, 5 and 7 mines 4 cents, No. 2 mine 3.7 cent, Nos. 3 and 4 mines 3-4 cent, No. 6 mine 3 cents and No. 9 mine 2 cents. An extra 2 cents is given on the shearing and the pillar rate is reduced 3 1-2 cents only as compared with 4 1-2 cents on Schedule 2. All hand mining at No. 8 mine is increased one cent per ton, and 5 per cent. increase is given to mine mechanics and shiftmen. On both Schedules the price of house coal is to be $1.00 for slack coal and $1.50 for run of mine exclusive of hauling.

Under the scheme of rates proposed in Schedule 1 the company calculate an increased payroll to the extent of about $16,000. Under Schedule 2 the increase to the company would be about $70,000 per year.

The men decided at their lodge meetings on the 14th, to reject the company's proposals, and the company were informed on the 17th, that the P.W.A. definitely rejected the company's proposals and asked their original demands of a 15 per cent. increase to mechanics and shiftmen, and a minimum rate of $2.44 per day for miners working by day wages, when out of working place. In the meantime on the 16th the company had posted notices to the effect that the option of making a contract under Schedule 2, having expired they would put Schedule 1 into effect on the 6th day of January 1908.

The Grand Council of the P.W.A. meet on the 27th inst., at New Glasgow, and it is expected they will then decide as what form their opposition will take. They have instructed the Grand Secretary to write the coal operators of Nova Scotia demanding by the first of May next a 15 per cent. increase for mechanics and laborers and $2.44 for miners out of places.

It is conceded by everybody that the increased rate for loading coal is a good move, but the P.W.A. as a body are not inclined to look with favor upon any adjustment of wages that concerns any one class of men. In the present case the [illegible]

natural because the pillar men has a good deal to say in the Councils of the P.W.A. and the loader is unrepresented.

The new schedule will therefore become effective on the 6th January and there is every reason to believe that it will result in improved conditions for everybody concerned. It is expected that the new rate for loading will attract enough men to prevent any loss of output through want of loaders, and that in consequence the machine runner will be able to work full time. The reduction on the pillar rate will not affect these men so hardly as one would think, for if the contentions of the company's officials are correct these men have only to work the hours the other men work to still retain their supremacy in the matter of wages earned. The Coal Company state that their mining costs have increased about 27 per cent. in the past three years and that they cannot afford to make any general increase in wages, but are willing to make adjustments to get a more equitable division of the payroll. They asked for the co-operation of the men and their advice in doing this. This was refused, and the new schedule embodies what the management of the company think is a better scale of wages than the one now in force.

It is not probable that anything further will transpire until after the new rates have gone into effect, and as these rates are an increase to a majority of the company's employees, it is not anticipated that any very strenuous opposition will be made by them, and nothing in the noture of a stoppage of work is likely to happen.

GENERAL MINING NEWS

NOVA SCOTIA.

SYDNEY.—It is reported authoritatively that the Dominion Iron & Steel Company has consummated a deal whereby it acquires the coal areas of the Cumberland Coal & Railway Company at Cow Bay Cape Breton.

The Cow Bay coal areas, leased by the Dominion Iron & Steel Company, are owned by the Cumberland Railway & Coal Company. This last named company's largest shareholders are the Cowan's Estate, Sir George A. Drummond, the Macdongall Estate, David Morrice and Crossen's Estate. The Cumberland Company is to receive a royalty of 10 cents per ton on all coal mined. The areas are ten miles east of the steel plant and comprise about 30 square miles of land.

GLACE BAY.—About 1,600 tons of coal are now banked at the Bridgeport Colliery.

The Dominion Coal Company is erecting four new batteries of boilers at New Aberdeen No. 2 Colliery. A self-oiling system is also being installed on all the engines. The bankhead is being repaired and new dwellings built.

HALIFAX.—The arguments on the appeal of the Dominion Coal Company against the decision of Mr. Justice Longley are now almost closed. The case for the Dominion Steel has been opened. The point on which the case hinges is whether the contract did or did not call for a supply of coal suitable for the uses of the Steel Company. The case is now adjourned until after the Christmas holidays.

ONTARIO.

TORONTO.—The approximate returns to the Bureau of Mines for the nine months ending September 20th, 1907, are as follows:—Silver, 6,919,987 ounces; copper, 5,111 tons; nickel, 8,087 tons; iron ore, 141,719 tons; pig iron, 180,663 tons; steel, 120,077 tons; zinc ore, 400 tons. The silver is valued at $4,212,000. The 1906 production was 5,401,766 ounces, worth $3,667, 551. The copper produced in 1906 (12 months) was 6,072 tons; nickel, 10,926 tons; iron ore, 128,049 tons.

OTTAWA.—The Board of Conciliation in the McKinley Darragh mine dispute has agreed upon Professor Adam Shortt of Queen's University as chairman.

CRAIGMONT.—The Canada Corundum Company has closed down its works for the winter on account of the business depression in the United States, resulting in a reduction in the orders for prepared corundum. A considerable stock of corundum is being held at Craigmont and orders will be filled throughout the winter. A small staff is being retained at the works to attend to the shipping and repairs. It is the company's intention to resume full operations next March.

LARDER LAKE.—The government road between Boston and Larder Lake has been completed. The water front has been reserved by the Government, also certain blocks of the town site.

COBALT.—Cobalt Lake mine is progressing. The north shaft is down 65 feet. A drift from this shaft has been started west. Shaft No. 4 is down 158 feet. Here also a drift is being started under the lake. A total of 1,256 feet of drifting, cross-cutting, sinking and raising had been done up to December 10th. More than 150,000 pounds of ore was then ready for shipment.

A rich vein of silver 16 to 18 inches wide is reported to have been struck at a depth of 263 feet on the Temiskaming property.

Concentrators are now at work at Coniagas, McKinley-Darragh and Cobalt Central properties. The Nipissing concentrators will, it is expected, be in operation by January 15th.

Two cars of ore were recently shipped from the Foster, averaging 42,000 ounces of silver each.

The Mahow-Brough property is said to have been taken over by the Haileybury Silver Mining Company.

It is estimated that the Nipissing Mining Company has about 75,000 tons of ore on the dumps. The average assays will run from 20 to 50 ounces to the ton. The company has not, as a rule, shipped ore running below 200 or 300 ounces to the ton.

The number of workmen employed on the Nipissing has been reduced from 300 to about 240. Very little surface work is being done. Underground development will be the principal form of activity during the winter.

On the 100-foot level at the Red Rock a vein of cobaltite, carrying some silver, has been struck.

The new compressor plant is now in operation on the Cobalt Central. The new strike on the second level is a vein 12 inches wide. It is reported to be very rich.

COPPER CLIFF.—Shipments from the Creighton and Crean Hill mines are reduced. Rumours of new finds of copper to the south, near the line of the Canadian Northern, are current. More news will shortly be forthcoming.

PORT ARTHUR.—Because many of the contracts made by foundries west of Port Arthur for Scotch pig iron have not yet expired, and because of the present stringency of the money market, the blast-furnace of the Atikokan Iron Company is shut down temporarily. While work is suspended many improvements will be installed. The system of handling coke and pig iron are to be changed and devices installed for handling and granulating the slag. The pig iron now in stock amounts to 3,000 tons.

BRITISH COLUMBIA.

VANCOUVER.—Johann Wulffsohn, German Consul accompanied by O. Gerle, M.E., is examing the Swede group of copper claims on Moresby Island. Near the Portland Canal district, a molybdenum prospect will be looked into.

VICTORIA.—Mr. E. Lindeman, appointed by the Dominion Government to look into the iron deposits of Vancouver Island, has made a tentative press report to the local papers. Mr. Lindeman is a Swedish expert and is well-versed in the study of iron ore deposits generally.

Mr. Lindeman started on his mission in June 1st of this year. His instructions were to cover the field generally. The task is a large one and it kept Mr. Lindeman moving to accomplish as much as he has. He began by examining the Sooke river deposits. Then he made his way north by the west coast and returned by way of Texada Island. He found very little development work done. On Texada Island, however, he found what he considered the best deposits. These were situated on the Quinsan River, on the Kla-anch River and at Head Bay on Nootka Sound.

Mr. Lindeman especially emphasizes the fact that all of these properties are yet in the category of prospects. Very little has been done, although more has been accomplished on Texada Island than elsewhere.

Speaking of this last named property Mr. Lindeman mentioned that considerable shipments had been made to Irondale, Wash., by the Puget Sound Iron Company.

A magnetic survey of the Kla-anch River deposits indicated the existence of large bodies of iron ore, 50 to 60 feet wide, and extending over 500 feet in length.

The diamond drill is recommended by Mr. Lindeman as the most satisfactory means of exploring. In summing up the possibilities of the country, he is confident that iron ore of good quality exists here in commercial quantities.

Except at Quatsino Sound the ore is magnetite. At that place a low-grade limonite is encountered. Much of the ore will probably average more than 60 per cent metallic iron.

Limestone there is in abundance and coke is readily available at a moderate price. The local market for pig iron should be good. There is, further, the chance of developing a trade with China and Japan.

Finally, Mr. Lindeman recommends the erection of a small blast furnace and a rolling mill. Charcoal could here be used instead of coke. This might be the nucleus of a large and thriving industry.

Bituminous coal has been discovered in the northern Cariboo district. Twenty square miles have been located on the main line of the Grand Trunk Pacific, about ten miles from the Grand Canyon of the Fraser River. Many thin seams have been discovered along with one or two of workable size.

ATLIN.—The steam shovel of the Atlin Consolidated Gold Mining Company, which started work on June 7th, stopped for the season on October 18th. The output of the season amounted to $80,000. A new sluicing station will be made next season farther up Pine Creek.

ROSSLAND.—A. K. Idler has secured a lease of the Evening Star mine. Twenty tons of ore are ready for shipment to Trail.

NELSON.—Excepting the Boundary region, the mining districts are in good shape. Zinc is attracting attention. If the lead bounty is removed there will be large developments in Slocan and East Kootenay. The Vancouver mine, Slocan district, has shipped 900 tons of zinc ore to Antwerp and is selling its lead concentrates to Trail smelter.

The Nelson Board of Trade has put itself on record as being entirely in favor of a renewal of the lead bounty for a further period of five years. The mine owner's memorial is in part as follows:—

"That said lead bounty has, by insuring a stable minimum price, been most effective and beneficial to the lead mining industry, with it to the smelting and manufacturing industries, and consequently to the general commerce of the Dominion.

"'That such results have been produced by a relatively small expenditure, as was anticipated, and as was represented when the original request for consideration was made to the Government. Out of $2,500,000 originally voted to be expended in the period of bounty termininating 30th June next, but $616,976.02 have been expended up to 1st December, 1907."

YUKON.

DAWSON.—The Guggenheims will employ many men and teams this winter in hauling 3,000 tons of pipe-line material from Twelve-Mile Landing, on the Yukon below Dawson, to points on the line of the big Twelve-Mile ditch. 4,000,000 feet of lumber will be hauled from the Twelve Mile mill in the spring. The work on the large dam on Bonanza Creek has been finished. From here electrical power will be distributed to the new electric lifts, new devices for working creek bottoms.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

The use of coal-cutting machines is steadily increasing in the United Kingdom. Thus the statistics show that in 1906 there were 333 collieries employing coal-cutting machines as against 295 in 1905. The total number of machines in use was 1,136 (as against 946 in 1905), of which 451 were worked by electricity and 665 by compressed air; the total quantity of coal obtained in 1906 by the aid of these machines was 10,202,506 tons, an increase of over two million tons as compared with the returns for the preceding year.

For the ten months of the present year, ending October 31st, exports of coal from Great Britain amounting to 54,816,190 tons were made, the value of which is placed at £34,516,460, an increase in value of over eight million pounds sterling above that of the total exports during 1906. This increase is attributed to heavier shipments to France, Germany and Italy.

The thirteenth annual statement of the coal production and consumption in the principal countries of the world has been issued by the Board of Trade. Production was made as follows: United Kingdom, 251,068,000 tons; Germany, 134,914,000 tons; France, 33,762,000 tons; Belgium, 23,232,000 tons; United States, 369,672,000 tons. Consumption is shown in the following statement: United States, 361, 492,000 tons; United Kingdom, 174, 329,000 tons; German, 119,282,000 tons; France, 50,298,000 tons; Russia, 25,786,000 tons; Belgium, 22,509,000 tons; Austria Hungary, 21,181,000 tons.

FRANCE.

The Government has increased the annual grant for the pensioning of aged miners, from a million to a million and a half francs.

An attempt is being made to group all French importers of foreign coal into one organization, the purpose being to act on the public powers, the railway companies, the Chambers of Commerce and others interested in the regulation of the foreign trade conducive to the interest of French buyers.

A decree signed by the President of the Republic, establishes, in the event of military requisitions necessitated by war, that the military authority, aided by the mining engineers, shall summon coal companies to supply whatever quantities of coal, coke and manufactured fuel as might be required.

GREECE.

The mineral production of this country last year was valued at £843,648, a very substantial advance over the 1905 returns. The chief mineral products of Greece are argentiferous lead, iron, calamine and magnesite.

UNITED STATES.

The production of platinum in the United States last year was 1,439 ounces, which owing to the abnormally high prices then ruling was valued at $45,189. Thus while in January, 1906, the price was $20.50 per ounce, in November it had risen to $38. Platinum rich in iridium was valued at $41 in February of this year and remained at that figure until April, since when there has been a steady decline, the price to-day being $26.50 for ordinary and $29 for hard platinum.

Production of pig iron in the United States last month was 1,828,000 tons, the smallest of any month in two years. In all 78 furnaces were blown out during the month,, reducing the number to a hundred and eighty-seven.

The November production of copper of the Butte district is placed at 8,376,200 pounds, a slight increase over October. Meanwhile the directors of the Amalgamated Copper Company have ordered that all the mines of the subsidiary companies, with the exception of the three mines of the Boston & Montana Company, be closed, and by the end of the month in consequence, operations will be suspended at the Anaconda, Butte, Boston, Washoe, Parrot, Trenton, North Butte and Butte Coalition mines, and the Washoe smelter.

The "Mining World," (Chicago), publishes a compilation showing that 114 mines and metallurgical works in the United States have paid dividends aggregating $81,601,426 during the eleven months of the present year, and in addition distribution of profits to the aggregate amount of $14,461,491 has been made by corporations such as the Amalgamated Copper owning interests in subsidiary companies.

It is computed that shipments of iron from the Lake Superior region will total 42,000,000 tons for the season of 1907, thus very considerable exceeding all pervious records in this respect.

The report of the Oroville Dredging Company, just issued, for the year ending July 31st, shows net profits amounting to $502,362. The company paid a dividend of 10 per cent. and placed $94,774 to reserve.

The report of the Homestake Mining Company, of Dakota, shows that the proceeds realized from the sale of bullion amounted to $4,541,096 from 1,264,177 tons of ore milled, having an average value of $3,592 per ton.

In a paper read before the American Mining Congress, Joplin Meeting, costs of operations in the Joplin District, Dr. E. R. Buckley expressed the view that under present conditions an ore body of ordinary size must contain at least 3 per cent. of zinc blende to be worked at a profit and pay a royalty of 15 per cent. with 60 per cent. zinc at $45 and lead at $80 a ton.

A general strike has been ordered in the Goldfield district, Nevada, the miners refusing to ascept payment of wages in the form of script. The Union instructs its members as follows:— "All employers of labor not paying cash or satisfactorily guaranteeing their paper will be declared unfair, and all men are warned not to work for them."

MEXICO.

A consolidation of the Fay-Cananea and Cananea eastern properties has now been effected, but the basis on which the arrangement was made has not been announced.

ARGENTINE.

A new law exempts from Customs duty, during a period of ten years, machinery, tools, and materials necessary for the installation and working of mining and metallurgical establishments, and also machinery for well-boring. In order to obtain the exemption in question, written application must be made to the Customs House through which it is desired to effect the importation.

FIJI ISLANDS.

Valuable discoveries of chalcopyrite and bornite are reported to have been made on the west side of Vita Leoua, south of the Mandi River. The Fiji Government has granted a prospecting permit to the discoverers for nearly 300 square miles; and a mining lease at the rate of $1.25 per acre. Specimens of ore from this locality are said to assay as 20 per cent. copper with gold and silver values.

AUSTRALASIA.

The annual report of the Secretary of Mines of Tasmania, recently issued, gives the completed totals of the mineral production for last year. The gold production was 60,023 fine ounces; blister copper, 8,708 tons; copper and copper ore, 2,234 tons; tin ore, 4,473 tons; silver-lead ore, 87,118 tons; iron ore, 2,600 tons; wolfram ore, 20 tons; bismuth ore, 6 cwt., and coal, 52,896 tons. The returns for the first half of 1907 show a falling off in all items except those of gold and coal which show a relative increase.

Queensland possesses very extensive coal areas. At present coal mining operations are confined to the West Moreton and Wide Bay districts, and two smaller centres, but the coal measures are by no means limited to these localities. Coal has been proved to underlie a large portion of the southern part of the State. Fine seams have also been tapped in the central districts, and it is generally believed that deposits of coal extend along the whole eastern seaboard. Operations are being steadily increased year by year, the production last year of 906,772 tons establishing a record.

The Commonwealth output of gold for the first ten months of the present year amounted to 2,620,771 ounces, a decrease of 272,589 ounces compared with the output in the corresponding period of 1906.

In connection with the recent coal miners' strike in New South Wales it is pointed out that "there is probably no industry conducted in the State that has been uniformly more unprofitable than coal mining." And from the figures published it appears that this statement is not an exaggeration, since of fifteen leading companies none has succeeded in paying over 6 per cent. in dividends, while the general average is not 3 per cent.

NEW ZEALAND.

A correspondent in the *Colliery Guardian* remarks that the combined action of the Dominion Government as producer, distributor and retailer of coal, does not appear to have been attended with encouraging results as anticipated. It is contended that the intervention of the New Zealand Government in the local coal trade has not reduced the cost to the consumer one iota, the prices at the various ports remaining the same as before the Government depots were established. Thus, although the Government has been enabled to hamper private enterprise, it finds its efforts to supercede it wholly unsuccessful, and it is not improbable that in the near future the experiment will become regarded as a costly mistake, conveying its own moral.

SOUTH AFRICA.

An interesting experiment is being made by the Village Deep mine, on the Rand, with a new electric furnace which is to be employed in sharpening drills underground. The advantages claimed for this unique furnace are reduction in cost of sharpening, in the saving of labor and delay incidental to carrying drills to the surface to be sharpened, and of overcoming the customary difficulties of overheating and burning the steel.

STATISTICS AND RETURNS.

Cobalt ore statement for the month of November, 1907:—

Nova Scotia Mine, to Copper Cliff, Nov. 28th, 46,730; Nov. 30th, to Copper Cliff, 45,500; total, 92,230.

Tem. & H. B. Mine, to Canadian Copper Company, Copper Cliff, Nov. 30, 67,000; Nov. 30th, 67,000; total, 134,000.

Townsite Mine, to Canadian Copper Company, Copper Cliff, Nov. 28th, 42,000.

Buffalo Mine, to American Smelting & Refining Company, Denver, 40,000.

Grand totals, 5,009,315 pounds.

Cobalt ore statement for the week December 7th to 14th, 1907:—

Nipissing Mines, to New York, Dec. 7th, 63,200; Dec. 7th, 66,090; Dec. 14th, 60,360; total, 189,650.

McKinley-Darragh, to American Smelting & Refining Company, Perth Amboy, N.Y., Dec. 9th, 44,630; Dec. 12th, 97,740; total, 142,370.

Right of Way Company, to Canadian Copper Company, Copper Cliff, Dec. 14th, 59,610; Dec. 14th, 63,080; total, 123,690.

Kerr Lake Mining Company, to American Smelting & Refining Company, Perth Amboy, Dec. 9th, 61,420.

Nova Scotia Mines, to American Smelting & Refining Company, Perth Amboy, Dec. 13th, 63,770.

Grand totals, 580,900 pounds.

SCOTIA COAL SHIPMENTS.

Coal shipments of the Nova Scotia Coal & Steel Company for November and for the 11 months compared with a year ago, were:

Shipments, November, 1907	56,951
Shipments, November, 1906	69,229
Decrease, November, 1907	12,278
Shipments, 11 months, 1907	585,701
Shipments, 11 months, 1906	612,655
Decrease, 11 months, 1907	36,954

The stock of copper in England and France, being consigned to those countries during November, amounted to 15,789 tons. The figures for November of the two preceding years were 14,243 tons in 1906 and 13,690 tons in 1905. The London price of copper, 30th November, 1907, was £63, as compared with £102 12s. 6d. on the same date in 1906 and £77 15s. in 1905.

Outputs of the Dominion Coal Company for the first half of December, 1907:—

No. 1	21,730
No. 2	29,500
No. 3	15,000
No. 4	19,900
No. 5	21,920
No. 6	10,040
No. 7	1,730
No. 8	6,300
No. 9	15,720
No. 10	4,160
	146,000

BRITISH COLUMBIA ORE SHIPMENTS.

Following are the ore shipments and smelter receipts of the mines in Southeastern British Columbia districts for the week ending December 14th and year to date in tons:

Mine.	Week.	Year.
Boundary	35	1,141,052
Rossland	7,155	210,625
East of Columbia River	3,634	167,556
Totals	10,824	1,579,233
Smelter:		
Trail	6,151	254,180
Northport	2,171	96,231
Marysville	600	30,000
Others	.....	1,110,079
Totals	8,922	1,490,490

Arrangements were made at the custom house for the shipment of 900 tons of zinc ore from the Vancouver mine to the Slocan district, to Antwerp. This is the first zinc shipment from this district to Europe. The rate given is $13 a ton.

BRITISH COLUMBIA ORE.

Appended will be found the ore shipments and smelter receipts in detail for the week ending December 14th and year to date in tons:—

Boundary shipments—Week, 35; year, 1,141,052.

Rossland shipments—Week, 7,155; year, 210,625.

Slocan-Kootenay shipments—Week, 3,684; year, 167,556.

The total shipments from the mines in the above districts for

the past week were 10,874 tons, and for the year to date 1,579,233 tons.

Trail smelter receipts—Week, 6,151; year, 254,180.

Le Roi smelter receipts, Northport, Wash.—Week, 2,171; year, 96,213.

Marysville smelter receipts—Week, 600; year, 30,000.

The total amount of recepts reported from the local and foreign mines for the past week kere 8,922 tons, and for the year to date 1,490,490 tons.

The output of the Crow's Nest Pass collieries for the week ending December 13 was 24,536 tons, or a daily average of 4,089 tons.

BRITISH COLUMBIA ORE FIGURES.

The following are the shipments and ore recepits from the Southeastern districts of British Columbia for the past week and year to date:—

Shipments—	Week.	Year.
East of Columbia River	3,453	163,872
Rossland	7,090	263,470
Boundary	.....	1,141,457
Total	10,543	1,568,799
Receipts—		
Trail	5,407	248,029
Marysville	600	29,400
Northport	2,670	94,060
Others	.....	1,110,079
Total	8,677	1,481,568

Bar silver in London has made a new low level for the year, dropping to under 25d. per ounce. The decline is said to be due largely to conditions in India.

The subjoined table shows the range of silver prices, quoted in cents, since 1900:—

1907	70⅛	53⅞
1906	71¾	62⅝
1905	65⅝	55
1904	62	53⅜
1903	61¾	47
1902	56⅛	47
1901	64	54¼
1900	65⅛	58⅞

The highest price since 1900 was attained on November 17th, 1906, when it reached 71 3-4 cents. The low record, 47 cents, was made on three occasions, November 28th, 1902, and January 22nd and 29th, 1903.

Returns to the Bureau of Mines show that the output of the metalliferous mines and works in the Province of Ontario for the nine months ending September 30th, 1907, was as follows:—

	Quantity.
Silver, ounces	6,919,987
Copper, tons	5,111
Nickel, tons	8,087
Iron ore, tons	141,719
Pig iron, tons	180,663
Steel, tons	120,077
Zinc ore, tons	400

Last year's total silver output was only 5,401,766 ounces, so that the product for nine months this year is greater than for the whole previous year. The value of silver has declined. The total last year was worth $3,667,551. This year nine months' product is worth about $4,312,000. Last year's copper production was 6,032 tons, and nickel 10,936 tons.

The following table, which shows the net profits, dividends and surplus after dividends of the Standard Oil Company, from 1902 to 1907, inclusive, the profits for 1907 being estimated, gives a good idea of the Standard Oil Company's tremendous earning power and the large surplus available for distribution to stockholders:—

Year.	Profits.	Dividends.	After Dividends.
1907	$85,000,000	$39,335,320	$45,664,680
1906	83,122,251	39,335,320	43,786,931
1905	57,459,356	39,335,320	18,124,036
1904	61,670,110	35,188,206	26,381,844
1903	81,326,904	42,877,478	38,459,516
1902	64,618,363	43,861,966	20,761,397
	$439,202,074	$239,923,670	$193,678,404

The above table includes only the surplus accumulated over the last six years and not the surplus since the time the company was organized, to Dec. 31, 1901. Until 1902, the Standard Oil Company apparently made it a point to distribute to shareholders each year a very large percentage of the net profits, but this policy was abandoned at the close of 1901.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ended December 20th totalled 22,051 tons, a daily average of 3,675 tons.

COBALT ORE SHIPMENTS.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

	Week ending Dec. 21. Ore in lbs.	Since Jan. 1 Ore in lbs.
Buffalo	.....	2,208,820
City of Cobalt	.....	101,230
Coniagas	.....	4,798,710
Cobalt Central	.....	101,360
Colonial	.....	74,250
Drummond	.....	108,920
Foster	.....	611,806
Green-Meehan	.....	196,780
Hudson Bay	64,000	243,170
Imperial Cobalt	.....	37,530
Kerr Lake	43,700	644,890
La Rose	43,730	5,706,875
McKinley-Darragh	.....	1,407,935
Nipissing	130,599	4,788,249
Nova Scotia	181,000	493,000
[illegible]		[illegible]
Red Rock	.....	91,443
[illegible]		[illegible]
Silver Leaf		93,618
[illegible]		957,157
[illegible]		1,618,138
[illegible]		[illegible]
Temiskaming	.....	430,611
University		61,383

The total shipments for the week were 463,029 pounds, or 231 tons. The total shipments since Jan. 1, 1907, are now 27,956,760 pounds, or 13,978 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2144 tons, valued at $1,473,196; in 1906, 5129 tons, valued at $3,900,000.

Company Notes.

The Tilt Cove Copper Company, Limited, at a meeting of the members of the Committee of Management, held in London on November 28, 1907, passed the following resolution:—

"That in interim dividend of 2s. 9d. per share be and is hereby declared on the shares of this company, free of income tax, payable on the 3rd day of December, 1907, to the shareholders on the books of the company on the end of December, 1907, and that the transfer books be closed during the said 2nd day of December, 1907."

Holders of share warrants to bearer are informed that Coupon No. 11 will be paid at the above rate, free of income tax, on presentation at the company's office.

In sending this notice of interim dividend the committee desire to point out that this dividend is based upon the profits for eight months, namely, from 31st December, 1906, to 31st August, 1907.

The directors of the Dominion Coal Company have declared a regular quarterly dividend of one per cent. on the common stock, payable in January.

A special general meeting of the Maritime Coal, Railway & Power Company was held at the Windsor Hotel on December 7th. An issue of new bonds was formally ratified. They replace the old bonds of the companies now amalgamated. The company's Chignecto colliery is being developed rapidly, and its output has materially increased. The power plant is supplying three large Amherst manufacturing concerns. In future, large water shipments will be made and a saving in freight is assured.

The Kerr Lake Mining Company has declared a regular quarterly dividend of 2 per cent., payable January 31st. Books close December 31st and re-open January 8th.

The statement of cash and cash assets of the Nipissing Mines Company, on December 16th, shows a total of $860,000. After $180,000 is deducted to pay the dividends there will be a balance of $680,000. It is said that between now and the time the dividend is payable the company will have received almost enough to pay the dividend, thus leaving the total of $860,000 practically intact.

The annual meeting of the Rochester Cobalt Mining Company is called for December 27th at Cleveland, Ohio.

DE BEERS DIVIDEND PASSED.

London.—The deferred dividend of the De Beers Consolidated Mines, Limited, the diamond syndicate, was passed to-day.

Owing to the unfavorable outlook in the diamond trade, the restriction of purchases in America since the financial disturbances and dumping of large quantities of stones in recent months before the agreement with the De Beers Company demoralized the market, the company has decided that it is necessary to strengthen its reserves in order to maintain prices. A telegram received from Kimberley says the company has ordered work in the diamond mines to be restricted to five days a week.

In his address to the shareholders of the Cleveland-Cobalt Silver Mines Company, the president, J. M. Smith, reported that the company had $33,307.70 in the bank, $48,554.50 in accounts receivable, being the balance unpaid on shares under option, and $749.90 worth of supplies on hand. The assets also comprise power house plant, tools, machinery and miscellaneous equipment, valued at $48,989.56; power house and other buildings, including real estate and telephone plant, $13,375; railway siding, $1,168.31; office furniture, $156.93, and development work, $9,804.13.

WATTS MINE ANNUAL MEETING.

The annual meeting of the Watts Mining Company will be held at the offices of the company, 54 Victoria street, Toronto, on January 15th.

The Northern Exploration Company has declared a dividend of ten per cent.

Directors of Nipissing have declared a regular quarterly dividend of 3 per cent., payable January 21. Books close December 27 and re-open January 22.

The statement of cash and cash assets of December 16 of the Nipissing Mines Company shows a total of $860,000; deduct $180,000 to pay dividends, leaving balance of $680,000. It is said that between now and the time the dividend is payable the company will have received almost enough to pay the dividend, thus leaving the total of $860,000 practically intact.

The annual profits of Le Roi mine have fallen from £37,000 in 1906 to £3,600 for the current year, owing to the drop in copper.

The Buffalo Mines, Limited, have declared a regular quarterly dividend of 3 per cent., payable January 1st, to shareholders on record December 17th.

The McKinley-Darragh Mines of Cobalt have declared a dividend of 4 per cent., payable January 15th. Books close at noon, December 31st and re-open January 10th.

On December 10th the Kerr Lake Mining Company declared a dividend of 2 per cent. and a bonus of 1 per cent., payable on or before January 31st, on all the capital stock of the company. This is the regular quarterly dividend.

MARKET NOTES.

Silver.—December 5th, 57 3-4; December 6th, 57 1-8; December 7th, 56 1-2; December 9th, 55 3-4; December 10th, 55 1-2; December 11th, 56 1-4; December 12th, 55 1-2; December 13th, 54 7-8; December 14th, 53 3-4; December 16th, 54 1-8; December 17th, 53 1-2; December 18th, 52 1-2.

Copper, 18th December, New York.—Lake, 13 1-8 cents per lb.; electrolytic, 12 7-8; London, £58 per ton.

SOUVENIR HAND BOOK

OF

A.I.M.E. TOUR

THROUGH

COBALT, SUDBURY AND MOOSE MOUNTAIN

OWING to the extreme care necessary in handling the colour press work in printing this volume the publishers have been unable to bring it out as soon as was hoped. It is now ready.

Orders have been received for a large number. It is probable that a second edition will have to be printed. The publishers will consider it a favor if intending purchasers will send in their orders as promptly as possible. In this way the need of a second edition can be determined early.

Roof for the Years to Come

Just one roof is GUARANTEED in writing to be good for 25 years and is really good for a hundred. That's a roof of

"OSHAWA" GALVANIZED STEEL SHINGLES

Put them on yourself---common sense and a hammer and snips does it. The building they cover is proof against lightning, fire, wind, rain and snow. They cost less because they're made better, and of better material. Write us and learn about ROOFING RIGHT. Address 205

The PEDLAR People (Est'd 1861).

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Wanted

Position as Manager, Superintendent or Assistant. 20 years practical experience as Consulting Engineer, South Africa, United States and Mexico, in underground mining, gold, silver, copper and pyrites mines and milling. Specialty, production at minimum cost. Expert bookkeeper and mine accountant.

Address "M. T." Canadian Mining Journal

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver, $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class - $80.00 to $500.00
2nd " - - 45.00 and 47.50
3rd " - - - - - 28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $1 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch. If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers, kindly mention this Journal.

Dominion of Canada

Synopsis of Canadian North-West Mining Regulations

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

N.B.—Unauthorized publication of this advertisement will not be paid for.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper **$5.00**

1,000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

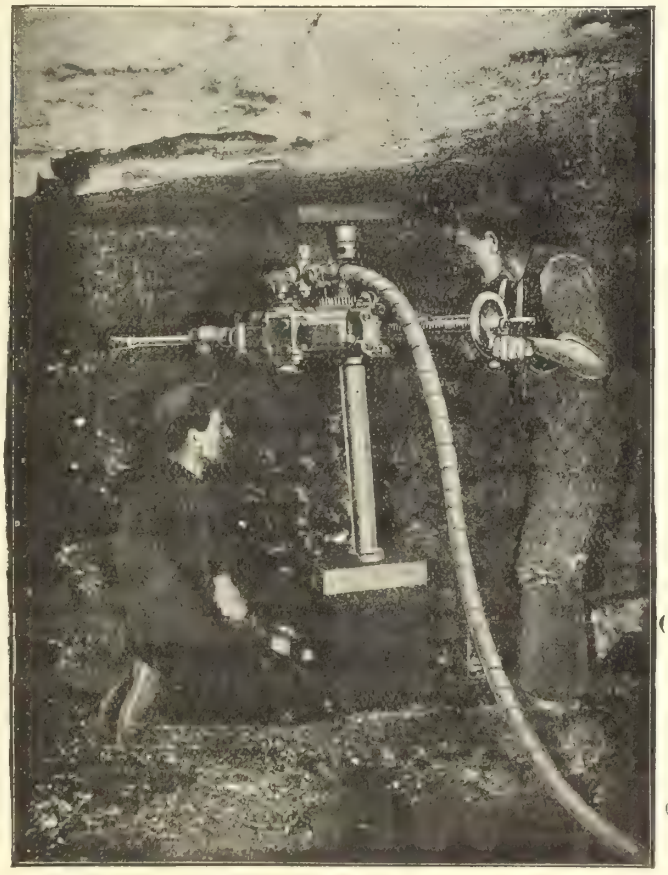
Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment ..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**



Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2.00. Each .. **.89**

Sullivan Electric Coal Cutters

For Low Coal

Sullivan "Low Vein" Room and Pillar Coal Mining Machine, Class "CE-6," on Self-Propelling Truck

The Sullivan Electric Chain Coal Mining Machine, for Low Vein Room and Pillar mines, makes a continuous cut across the whole face or breast, without withdrawing the cutter bar from the coal, without hand barring or changing of jacks, and without moving roof props.

It requires only 5 feet and 3 inches of space in front of the coal for its operation; it stands 21 inches high while cutting, and 30 inches on its self-propelling truck. This machine shows, in actual work, a cutting efficiency 50 to 200 per cent. in excess of any ordinary chain breast cutter. It may be used with safety under weak roofs, since the props may be permanently set one-half as far from the face, as is required by the latter machine.

A Low Vein Long Wall Machine of the same pattern is also manufactured.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

R. G. DRINNEN, Superintendent. **C. G. S. LINDSEY,** General Manager.

HUNTING TRIPS

THERE is no Railroad in America, probably in the world, that can bring Sportsmen within touch of so many famous haunts of big and small game as can the Canadian Pacific. From the lordly Moose of Nova Scotia and New Brunswick to the Bear and Mountain Goat of the Rockies is a far cry but it is C.P.R. all the way, traversing en route hundreds of miles of ideal hunting country.

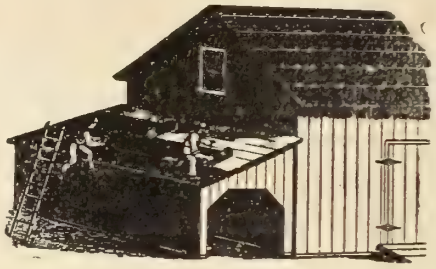
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

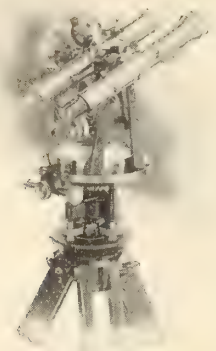
Leading Features of a Good Rock Drill

No. 5.—Lower Heads

The Gland head furnished with the Rand "Little Giant" drills has the minimum number of parts possible in a head with a gland. This feature combined with long guide for the rod, ease of access and great strength, makes an ideal head which may be used for either steam or air.



The lower head for air has the fewest number of parts of any drill head in use, there being no bolts, nuts or pins. There are only four parts, the ring, two halves of the bushing and the leather packing.

McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

THE OLD YEAR AND THE NEW.

During the past twelve months the mining industries of Canada have not stood still. In the main there has been not inconsiderable expansion, more especially in Ontario and Alberta. But, quite as important as new growth, there has been a gradual strengthening of established enterprises. The adjustment of relations between mine operators and employees for definite periods, and the increasing use of arbitration in place of the wickedly wasteful strike have imparted a tone of stability to the mineral industries. In short, a firmer foundation has been laid for mining and metallurgy in the Dominion.

The financial depression, after reaching its zenith in December, has fortunately given way to easier conditions. At worst it was a transitory affliction. It has had the effect of weeding out unsound schemes. Although it has acted as a deterrent upon immediate development, it has also curtailed the efforts of stock-jobbers and promoters. Undoubtedly this is salutary. Therefore we may consider the scarcity of money as not altogether a hardship.

At any other period such a dehydration of stocks as has occurred within the last six months would have created a panic. But, in spite of the apparent imminence of a financial crisis, confidence in our ability to weather the storm has never been shaken. The tone of the press-writers has been uniformly optimistic and has been reflected by the country at large.

And this confidence is not founded upon fancy. It arises from a better knowledge of the vastness and availability of our material resources, from a growing faith in our own ability to use and conserve these resources and, not least, from the increasing sense of national unity and solidarity that is becoming a distinguishing mark of Canadians.

But the very vastness of Canada's natural wealth is at once cause of pride and of exceeding humility. We have but to look to the Mother Country to learn that we are yet in the first stages of development. And, glancing at other sister nations of the British Empire, we shall find many causes to blush at our sloth and inefficiency. Our southern neighbors may also be our instructors.

We take a good deal of pride in speaking of Canada as a "nation." But if Canada is to take her rightful place in the comity of nations she must be apt to learn. She must think and act imperially and not merely nationally.

THE DOMINION.

During 1907 every mining Province of the Dominion held its own and three, at least, showed new promise.

Nova Scotia's gold industry is just about where it was in 1906. In coal mining there have been large new activities, but a slightly decreased production. The acquisition of the Lingan areas by the Dominion Iron & Steel Company, and the purchase of the Gowrie and Blockhouse coal mines and lands by the North Atlantic Collieries, are perhaps the most noteworthy developments. Owing to labor trouble at Springhill the Cumberland Coal & Railway Company was shut out of the market for some months. In attempting to fill the gap several smaller collieries were given a better grip on life. There is very little of moment transpiring in the mining of other minerals.

At Lepreaux and Bathurst, in the Province of New Brunswick, iron ore deposits are being opened up by the Dominion Iron & Steel Company and by the Drummond Mines Company respectively. The Bathurst ore bodies are of unusual promise. It is easily conceivable that New Brunswick may, within the next few years, begin the production of iron and steel.

Quebec counts upon largely increased asbestos output for 1908. The selling price has gone up and the industry is in excellent shape. Chrome ore mining is giving encouraging results. Mica, ochre, copper and iron ore are the objects of less attention. But graphite is engaging capital and molybdenite may soon follow. Whilst the year 1907 has outshone 1906, it will in turn be eclipsed by the present year.

The Ontario districts of Cobalt, Sudbury, Thunder Bay and Rainy River have all been the scenes of increased activity during 1907. Public interest of course is more or less centered in Cobalt. Yet there are indications of a revival of silver mining in Western Ontario. The price of silver is, naturally, the controlling factor in the situation. However, improvements in methods and machinery, together with transportation facilities, have very materially lowered the point where profits begin.

Cobalt is rapidly approaching the stage when costs will be reduced to a business-like level. The past year has been a period of profound change and transition. Market manipulation and fraudulent promotions are, so far as the camp is concerned, almost things of the past. The labor difficulties were met and overcome by concerted action on the part of the operators. But the issue of the struggle might have been different were it not that public sympathy was with the operators. The wave of depression, bringing with it scarcity of employment, also helped to decide the dispute in favor of the operators. At present Cobalt is taking life very seriously. The output of the camp has grown by leaps and bounds. Concentrators, stamp mills and excellent power equipments are rapidly coming into commission. Three or four smelters at various distances, but all in Ontario, will gradually take care of a fair proportion of the ore. Cobalt is safely established.

The blowing-in of the Atikokan furnace at Port Arthur was a landmark of the past year. Other events that will influence the future of the Province were the visit of the American Institute of Mining Engineers and of several parties of British journalists. We may also class amongst the most important features of the year the inception of the anti-wildcat campaign by THE CANADIAN MINING JOURNAL. Public opinion has been aroused, Government assistance has not been sparingly given, and it is improbable that Ontario will again be the happy hunting ground of cheap fakirs.

Alberta, possessing at this moment twenty-eight producing coal mines, has merely touched the fringe of her limitless coal fields. The past year has witnessed active prospecting, development, and, lately, an extension of the market for the Province's output.

Saskatchewan owns and operates a coal mine of her own. Otherwise we hear very little about that Province's minerals.

British Columbia, whose estimated output shows a net increase of $4,636,625 over 1906, has made huge gains in coal production. The estimated increase in value of her coal output is $3,190,000—an almost startling figure when all conditions are considered. This increase will be even more marked during 1908, as the Crow's Nest Pass Coal Company is putting up equipment whereby its output will be doubled, and later in the year the C. P. R. coal mines at Hosmer will come into commission.

The increase in the value of the copper output was almost entirely due to the rise in price.

MINERAL COLLECTIONS—AN ANNOUNCEMENT.

On another page of this issue we publish the conditions and terms of Mr. J. B. Tyrrell's prize, offered for the best collection of Ontario minerals made during the current year.

As the prize is open to all Canadians, it is to be hoped that active interest will be displayed in this competition. The reward in itself is a substantial incentive to students and others. But the winner of the "Tyrrell Prize" will have the added satisfaction of having increased his own knowledge of an important science. We are sure that the response to this generous offer will justify the donor in continuing it from year to year.

THE YUKON—A CORRECTION.

In the *Engineering and Mining Journal* for January the 4th are two articles by Mr. J. B. Hutchins, which purport to give a review of the mining work in the Klondike during 1907. One is entitled "Klondike District" and the other "Gold Dredging in 1907." Both articles give very erroneous impressions of the work that

has been accomplished in that portion of Canada during the past year.

Mr. Hutchins was in the Klondike four or five years ago, and if he looked over the country at all he must know that there are very much more than 3,000 acres of so-called dredging ground. There is easily that extent of vacant ground in the flats of the Klondike valley alone, without counting the flats of its tributaries, such as Bonanza, Hunker and Bear Creeks, which will greatly extend these figures. Besides these areas there are extensive flats of gold-bearing gravel on Dominion Creek and its tributaries, which taken with those of the Klondike will raise the total number of acres to many times the area stated.

Part of this ground is acknowledged to be unfrozen, and therefore can be easily dredged. Mr. Hutchins, moreover, says in another place: "Were the alluvion of the Klondike Creeks unfrozen, dredging could be carried on at a large profit, for the other conditions are generally favorable to dredging. The gravel is fine, clean and of moderate depth. It generally rests on a favorable bed rock." But the text of his two elegiacs is contained in the sentence "the problem of dredging frozen ground is in a most discouraging state." One dredge is quoted as having given satisfactory returns, but three other powerful dredges from which returns were not available are stated to "have been very disappointing in return."

The dredge above spoken of is doubtless the large dredge which has been working for three seasons on the flats in the Klondike valley, near the mouth of Bear Creek. Nothing is said of the small Ridson dredge, which was working on and near Discovery claim on Bonanza Creek, and which has already extracted gold to the value of a million and a quarter dollars out of three worked-out mining claims.

The Bonanza basin dredge was working near the mouth of the Klondike River in 1906 with great success, as stated by Mr. McConnell, the Canadian Geologist, in the report of that year. But last year it was decided to alter this dredge, remove its steam boilers and machinery and replace them with electric motors. These alterations were not completed until the first of September, after which date it was operated with marked success until the 17th of October.

The three dredges referred to by Mr. Hutchins were located on the lower portion of the valley of Bonanza Creek. Nothing is known of the results obtained by them; but another dredge has been built near them by the same company that owns these three dredges, and it will be ready to begin operations next spring. Three more large dredges have also been built by the same company on Hunker Creek, and they too will be ready to begin work in the spring. These seven dredges are all to be operated from one central electric station, and it is yet much too early to say either that they have not or that they cannot be worked successfully.

Four other dredges also began operations on Forty Mile River, one in Canadian and three in American territory, and, while no information has been made public as to the results so far obtained, even if they did not make much money this year it is but reasonable to give them a little time to become adapted to local conditions. It is well known that the Pioneer dredge of the Klondike, which finally proved so successful on Discovery Claim on Bonanza Creek, was at first an expensive experiment.

Besides the dredges above enumerated, which have been already installed, the N. A. T. & T. Company is preparing the ground in the valley of Miller Creek, in order to be able to put dredges on it in the near future, by stripping the moss and muck from off the gravel by the use of water under hydraulic pressure.

In this connection it would be interesting to know exactly where the thawing of ground by stripping it of its covering of moss and muck has proved a failure. For, in spite of Mr. Hutchins' statement, the exact reverse is the case, as was long ago shown by Messrs. McConnell and others who are thoroughly familiar with that country, and as may now be seen at many places in the Klondike. The thawing of gravel to a depth of 12 or 15 feet, such as seen in many of the open cuts which are often sunk to bed rocks in a very few weeks, cannot be correctly referred to as "progressive seasonal thawing," as Mr. Hutchins speaks of it.

Exactly what is meant by frozen gravel being below the level of "ground-water" is not clear, but the clean use of geological terms can hardly be looked for in an article where "Poverty Bar," which is a distinct terrace, is spoken of as a peneplain. For this latter term, which means a base-levelled plain of erosion, is about as far removed from a terrace as two physiographic features can be.

In regard to the length of the season for work the extraordinary statement is made that the average night temperature on the first of May and on the 15th of October is fifteen below zero F. People who believe this statement will doubtless be prepared to believe that the country is too cold either to mine or to live in.

No papers are more interesting to miners or investors in mines than careful reviews of the work of the year, and consequently none can do more harm than such papers as these, filled with inaccurate statements and backed by the name of a great mining paper such as the *Engineering and Mining Journal.*

CANADIAN SILVER.

The shipment of a quarter of a million ounces of bar silver from the Trail refinery of the Consolidated Mining & Smelting Company to the Canadian Mint at Ottawa is a significant event.

Remembering the reports, industriously circulated some months ago, to the effect that no silver of sufficient purity for use in the Mint was produced in Canada, it is gratifying to note that the Trail silver is 999 fine. Thus,

not only does this metal meet the requirements of the Mint, but it is more than ordinarily free from alloys.

The Mint is now in operation, and we predict that not the least distinguishing feature of Canada's history in 1908 will be the fact that Canadian silver is being mined, smelted, refined and coined by Canadians in Canada.

"HIGHLAND MARY."

In this season of annual returns and estimates it is hard to give up space to the admirable Mr. Law or to the retiring Russell. Yet, as many of our readers are awaiting news, a prapagraph must be spared.

Law now awaits jury trial. He is charged by the Crown with conspiring to defraud. His bail was fixed at $20,000. As Assistant Crown Attorney Price pointed out, Law and his confreres have milked the country of about $300,000. The evidence adduced in the preliminary Police Court hearing was of a nature so damaging that a much higher bail would not have been amiss.

Amongst other evidences of fraud was the sworn testimony of the mining engineer employed to superintend work on the "Blue Bell" claims. Law & Company publicly announced that Blue Bell assays ran from $200 to $20,000 to the ton. Their engineer swore that he had only made two assays that showed gold at all. One of these was reported as showing $2.50 to the ton, and the other $1.50 to the ton.

This instance is typical. It were profitless to mention others. One incident, however, is interesting. It developed during the conspiracy trial, that the "Ontario Mining News" owed its existence to Law & Company. On one occasion Russell took 10,000 copies of that sympathetic sheet to England with him.

So much then for the conspiracy case. Law & Company stand disgraced and dishonored.

The Companies' Act case is still dragging along. It served a very useful purpose in eliciting evidence sufficient to prompt the Crown to prosecute Law for fraud.

Russell, Law's very silent partner, is reported to be in Lima, Ohio.

PROFESSIONAL SERVICES.

Enquiries reach this office every day from all parts of Canada as to the merits of particular mines. It is obviously out of the question for THE CANADIAN MINING JOURNAL to attempt to answer these questions.

To formulate a reliable opinion of a mine it is necessary to visit and inspect that mine. This costs money and can only be adequately done by a trained mining engineer.

The holders of small interests in mining properties are often unable or unwilling to stand the expense of engaging an engineer to get information for them. But, often also they are unable to get satisfactory information from the officials of the company.

When this is the case there is a remedy. If a group of shareholders, whose holdings represent at least one-fifth in value of the total stock, arrange to act together they can secure from the courts the right to have the mine examined and reported upon. The expense of engaging a properly qualified man will then fall lightly upon many shoulders; or may, under certain circumstances, be referred to the company itself.

THE CANADIAN MINING JOURNAL will be glad to assist and advise any persons who find themselves unable to obtain information. Finally, it is necessary first of all that these persons help themselves. But we shall willingly help persons interested in the same mine to come together.

WARNING.

In the Toronto newspapers there has appeared of late a copious advertisement. One L. W. Spear invites the singed, but forgetful, public to join him in an effort to develop groups of mines in various districts.

We notice that Mr. J. F. Lennox, barrister, of Toronto, is vice-president. Mr. Lennox's name was associated with the Larder Lake Proprietary Gold Fields. Last autumn a number of this company's employees were met on the way out from Larder Lake. They claimed that they had not been paid for some months and that they had not been decently fed. The JOURNAL mentioned the circumstance at the time.

In cases like these a reputable officer of a company resigns or demands and receives an explanation.

Taking Mr. Lennox then as a sample of those associated in this scheme, Spear's Canadian Mines Development, we rise to remark that Mr. Lennox must clear his name of several smirches before he has any right to appeal to the public for money. For instance, he might tell us something of Silver Bird and its aerial flight.

Further, the mining proposition that needs a large fraction of a page of newspaper space where to spread its is already damned.

Referring again to the advertisement, we notice that the promoters of this co-operative plan recognize that guady language is no longer desirable. It would, mayhap, be as salt upon the wounds of those who have gone in for "permanent" investments of the Silver Bird variety. Realizing this, Mr. Spears delivers himself in tones dulcet and moderate, but insistent. His is an appeal to reason, not a play upon the sinful thirst for shekels. And yet we must (were we not requested to by Mr. Lennox and others last winter?) watch Silver Bird!

The possible investor must bear in mind the fact that in putting his money into heavily advertised mining schemes he is not merely purchasing problematical mining shares, but is buying an interest in a large advertising debit account, running up to thousands of dollars and chargeable in all cases, directly or indirectly, to capital outlay.

PRESENT STATUS OF TECHNICAL EDUCATION IN NOVA SCOTIA.

By F. H. Sexton, Director of Technical Education for Nova Scotia.

Technical education in Nova Scotia is at present only seven months old and has as yet created no history for itself. The alacrity with which many men have taken advantage of the simpler foundation courses offered this year in the Technical Schools established at Halifax, New Glasgow and Sydney augurs well for the future of this department of education. It was on April 25th, 1907, that the Provincial Legislature of Nova Scotia passed an "Act Relating to Technical Education." This made the people of this province the first in Canada to accept the conclusive lessons taught by Germany and other nations in the efficacy and necessity of this form of education to the material extent that they were willing to establish a system of technical instruction on a comprehensive basis which could be enlarged to meet future demands.

This Act provided for a technical college to be built in the capital city, which would be the capping stone of the system. In the words of the Act: "There shall be established at Halifax, an institution for the purpose of affording facilities for scientific research and instruction and professional training in civil mining, mechanical, chemical, metallurgical and electrical engineering, or any other departments which may from time to time be added.

In order to articulate the work of this institution most closely with the other colleges already existing in the province, a member from each of these colleges and one from Mount Allison University, New Brunswick, which draws its students to a great extent from Nova Scotia, are nominated to the Governing Board.

The plans for the main building of the Technical College have been completed and a cut of the front elevation is given on the cover of The Journal.

The building is designed in a free Renaissance style of architecture. It is to be constructed of Nova Scotia pressed brick and freestone. The central part of the structure is to be composed entirely of stone and by projecting from the main part of the building will serve to relieve the impression of flatness to which it might otherwise be prone. The building will consist of two stories and will be 170 feet by 48 feet, with two projecting wings in the rear, each 40 x 55. The Provincial Science Library, which now represents a handsome nucleus of valuable accessions and the Provincial Museum are to be given a home in this College. This arrangement will prove an advantage to all the departments, because it will give the Library and Museum a chance to expand into their full spheres of utility, and will place the scientific volumes of the former and the large number of mineralogical and geological specimens of the latter at close hand for purposes on instruction.

The plans for the building are finished and are shortly to be put out for tenders, so that construction may begin with the disappearance of frost in the spring.

Besides the full engineering courses in the Technical College, it is the present intention to hold a number of shorter courses in the different branches, which will be suitable for men in practical life, who wish to obtain a higher theoretical knowledge of the scientific basis of the profession in which they are employed, but who lack all the necessary preliminary knowledge to be regular matriculants in the College, or who are prevented by one reason or another from giving up the full number of years required to obtain an engineering degree.

There are to be two laboratory buildings in the rear of the main building, one devoted to Mining and Metallurgy and the other to mechanical engineering, electrical engineering, hydraulics and strength of materials. The buildings are to be of the factory type of reinforced concrete and steel, so that they can be readily enlarged at any time.

Since the coal industry is the greatest one of which the province boasts, the mining laboratory is to be equipped for research and instruction in this branch of mining industry as well as metal mining. Almost all the mining engineering laboratories in America with a few notable exceptions have equipped themselves to carry out the operations connected with metal mining and ore dressing and have neglected the other branch of the industry. Research problems of such nature as are vital to the industrial progress of the province will be carried out in the various laboratories, and it is hoped that the closest relationship may exist between the industries and the Technical College.

The fees for tuition at this Government Institution will be nominal and everything will be done to encourage the poor boy who desires a higher scientific training, but who is prevented from going abroad to obtain it, on account of the attendant expense.

Under the Technical Education Act there is also provision for secondary education by continuing under the new Department of Technical Education the coal mining and engineering schools which have heretofore existed under the Department of Mines and also by establishing in industrial centres "Local Technical Schools."

The coal mining schools are conducted for coal miners and coal mining officials, who wish to acquire a greater knowledge of the science and art of coal mining and for those who wish to procure the Government certificates of competency for managers, under-ground managers and over-men. For educational purposes, the portions of the province which contain the collieries have been divided into five districts and an instructor is appointed who devotes his whole time to teaching coal mining and surveying in that district. Classes are held at almost every colliery centre and all instruction is absolutely free to the students. In the districts that are so large that the regular instructor cannot overtake the work, local assistants are appointed to aid him. At the present writing there are 18 coal mining schools in operation.

As the coal mines grow larger and deeper and call for more and more economical working in the face of increased engineering and commercial complexities, the educated miner will be more and more necessary to carry on the work successfully and to make the requisite provisions for guarding human life. These coal mining schools, which are being brought to a higher standard each year, will be a great boon to ambitious men by providing a practical education at their doors and will also serve in supplying educated mine officials to superintend the collieries.

The engineering schools, of which there are 15 at present, are instituted in every colliery centre where enough students make application to warrant the necessary expenditure. These schools are established for the purpose of instructing the men who operate the machinery about the collieries in the principles of steam and mechanical engineering, so that they may possess themselves of the theory of these branches and be enabled, if they wish, to obtain Government certificates of competency at 1st, 2nd, 3rd or 4th class stationary engineers.

A general educational standard is required for entrance into the coal mining and engineering schools, and preparatory classes in mathematics and English composition are held in every locality where the coal mining and engineering schools exist. Thus no ambitious man who has to earn his livelihood is withheld from securing such a practical education as will enhance his position and secure promotion.

The proviso for "Local Technical Schools" in the Act reads as follows:—

N. S. Laws, Chap. 1, sec. 13: "The Governor-in-Council may from time to time establish, in such places as it may be deemed advisable, local technical schools to furnish industrial education of such character and extent as will most effectively meet the requirements of the population and industries of the locality."

These local technical schools are supported both by the province and the locality, each sharing nearly equally in the financial burden. This year three industrial centres, Halifax, Sydney and New Glasgow have responded with alacrity and have established schools of this character. In the three, the enrollment has exceeded 400 and the average attendance for the first two months is above 70 per cent. The classes offered this year are as follows: Business English, Technical Arithmetic, Practical Algebra and Geometry, Mechanical Drawing, Machine Drawing, Architectural Drawing, Elementary Electricity and Magnetism, Mechanism, Surveying and Plotting, and Chemistry.

The courses are practically free, a deposit of $2.00 to $4.50 being required on entrance to any class, and this amount being refunded at the end of the term according to each student's attendance. The classes are open to everybody who has the necessary knowledge to enter the class which he desires to attend. It is hoped that there will be a goodly number next year from those receiving instruction in these foundation courses at present, who will wish to pursue their studies further and thus form a warranty for offering classes of more advanced grades.

Several other industrial centres than the ones named have intimated their desire of participating in the scheme of local technical schools, and next year a number of the progressive towns will have schools offering such pratical instruction in mathematics, drawing, etc., as well be best suited for the men employed in the local industries.

Nova Scotia has provided for a system of Technical Education which can be expanded from the present working basis to supply practical and industrial and engineering instruction from the lowest to the highest grade. This will train the native born to operate native industries and to develop the natural resources of this section of Canada to the utmost. In putting the actual machinery of the system in operation, the Government is proceeding cautiously and conservatively, but it intends to provide for technical education throughout the province, where it can be so advantageously offered as to warrant the expense for its establishment.

MINING IN QUEBEC IN 1907.

By J. Obalski.

The mining industry in Quebec is characterized by its steady development and so far it has been free from the erratic movements which follow upon fresh discoveries.

For the study of this subject, we may divide the Province into two sections:—

1. The old settled districts of the Eastern Townships and the valley of the St. Lawrence and Ottawa Rivers.

2. The new districts in the North.

I.

In the Eastern Townships the leading industry is asbestos, which has been flourishing so far. There are thirteen companies operating at Wolfestown, Black Lake, Thetford, East Broughton and Danville, which employ about 2,500 men, and have been producing regularly. The output for 1907 is expected to be 25 per cent. higher than in 1906. It should be added that the selling price has considerably increased, especially for the crude varieties; it now reaches close on $300 per ton for the first class and $200 for the second, while the price for fibre varies from $15 to $100, according to grade. The fibre is now in great demand owing to the new use made of it for the manufacture of boards, and this has led to the opening up of new mines and the erection of new mills at East Broughton, which district is mostly a fibre producer. A new mill has been started during the year and two others are in course of construction at the same place. A mill has also been erected at Colraine, but it has been working only a few months.

In Bolton, near Eastman, a body of asbestos-bearing serpentine has been developed on quite a large scale, this district being an entirely new one.

There was practically nothing done in the Ottawa region, where a fine quality of asbestos—but rather scarce—exists.

The asbestos industry is now a permanent one; the mines are well equipped with proper plant, the result of twenty-five years of experience of men who have made that industry their career and have created it here.

The Shawinigan Power Company has established a main line carrying 50,000 volts, which divides its power among the various mines to the extent of over 6,000 horse-power.

The proximity of the railway makes the transportation question a very simple one, while labor is both plentiful and good.

Practically all the mines are yielding good returns to their operators.

The Chrome mines found in the serpentine belt in the Township of Colraine are now worked on more scientific methods. During the year diamond drilling has been resorted to for the purpose of proving the existence of ore bodies at a greater depth than the quarries previously worked, and, as a result of such

diamond drilling, the Black Lake Asbestos & Chrome Company is sinking a 300 foot shaft on this property.

Three companies have been operating for chrome, and the output will compare favorably with that of last year. Some parties, consisting of a few persons, have also been working on a small scale. The concentrating of the low grade material is now successfully effected by means of stamp milling, followed by the use of Wilfley tables. About 100 men are employed in this industry, and there are 45 stamps in all at the four mines, producing about 8,000 tons.

There is nothing special to report regarding the iron industry, which is represented by a charcoal blast furnace at Radnor and by two at Drummondville, all three using mostly bog ore.

Experiments are still being made in connection with the treatment of the magnetite sands of the Gulf of St. Lawrence, chiefly by means of electricity; but, so far, no definite result has been obtained.

The same remark applies to the treatment of titaniferous ore.

Ochre is worked at St. Malo, in the vicinity of Three Rivers, by three different parties, and is shipped in the calcined form to the amount of about 3,000 tons.

Low grade copper ore is shipped as usual from two mines at Capelton, near Sherbrooke. The ore is used for making sulphuric acid and some value is added by its contents in silver and copper. The Nichols Chemical Company uses some of the ore on the spot, the balance being shipped to the United States. The Eustis Company has its mine run by electricity and is operating a concentrating plant consisting of crushers, collars and Wilfley tables. The output is about 30,000 tons yearly.

Some other prospects have been carried on in connection with copper ore in the same district, among which may be mentioned the Ascot mine and a group of properties developed by Mr. A. O. Norton. The latter is quite important and will probably lead to the making of a valuable mine, as the ore found compares favorably with that got out at Capelton in about the same geological conditions.

Some prospecting for galena has been done at Gaspe Bay, and for galena and zinc blend on Calumet Island (Pontiac County), but so far no shipments have been made.

Practically nothing has been done in connection with the alluvial gold of the Eastern Townships, but the discovery of a small deposit of gold-bearing quartz in Marston, near Lake Megantic, is worth recording. It is the first time in the history of that district that gold has been found in quartz in apparently commercial quantity. Of course the discovery is a fresh one, and we do not know how the prospect will turn out, but it is presumed that further prospecting will be carried on next summer, which may also call attention to the valuable placers formerly worked in the Chaudiere valley and in Ditton.

In the Ottawa district the only activity manifested has been in connection with amber mica, the main producing mine of which has been that of Blackburn Brothers, near Perkins' mill in Templeton. A good many small producers are taking out some mica which is used by large concerns in Ottawa, which city remains the centre of that industry. Mica is shipped in the form of thumb-trimmed and split and is also prepared in large sheets under the name of "Micanite." The value of the material shipped may represent about $200,000.

A company has also reopened two old white mica mines at Maisonneuve (Berthier County) and near Murray Bay (Charlevoix County), which also contain some rare earths, but no output of any importance has yet been reported.

Several companies have been organized for working the graphite deposits of Buckingham, Calumet and St. Jovite. Mills have been erected or fitted up anew, and it is proposed to establish others, but the difficulty of concentration has retarded the development of this industry.

Little or no work has been done in connection with molybdenite, phosphate, feldspar or baryta.

In the Three Rivers district some wells have been bored for natural gas, which is conveyed by lines of pipes to that city and some of the neighboring villages.

The manufacture of Portland cement at Hull has been a success, and the output is to be increased still more.

The getting out and manufacture of building materials are progressing proportionately to the development of the country.

II.

The Districts in the North.

The new mining districts of the Province comprise the unsurveyed portion of the northern territory of the country of Pontiac, east of the Province of Ontario, and the Chibogomo region. Both are included in the Huronian belt running from Lakes Superior and Huron to Lake Mistassini.

The former region, owing to its proximity to Cobalt, led to the conception of great hopes which so far have been but slightly realized. In fact, the explorations of the Geological Survey and the Quebec Government as well as the many prospects carried on by private individuals, have led to the discovery of very little beyond the existence of rocks of that Huronian formation, in which, however, one must not despair of finding economic minerals. Up to now, a little gold-bearing quartz and copper ores have been found disseminated in quartz veins in the vicinity of Lake Opasatica and near the Ontario boundary. It is also worthy of note that the formation in which gold is found is comparable to that of Larder Lake.

In a westerly direction, molybdenite has been found at several points, amongst others on the Keewagama River, where it is fairly abundant and where bismuth also has been observed.

Further on, on the Harricanaw River and on the Bell River, a little copper has been found.

In the surveyed townships east of Lake Temiscamingue a little Cobalt ore has been discovered, but not as yet in commercial quantites and the presence of silver in it is not yet fully confirmed.

The Chibogomo district is more important, but, as it is situated 200 miles from a railway and is difficult of access, no operations can be carried on there until a railway is built. The last prospects have led to the discovery of considerable deposits of copper, of good grade, yielding values of gold, of mispickel iron gold-bearing quartz, of iron pyrite, of magnetic iron and of asbestos, the whole in commercial quantities. Moreover, a slate conglomerate formation, similar to that of Cobalt, has been found and, in some parts of the same, Cobalt bloom, which leads to the hope that other more important discoveries will be made.

The explorations of the Geological Survey, of the Quebec Government and of private companies have established the value of that district.

To sum up, the year 1907 has been a good one in the Province of Quebec and it is probable that the total output will be greater than last year's.

MINERAL PRODUCTION OF BRITISH COLUMBIA IN 1907.

By E. Jacobs.*

The official estimate of the approximate total mineral production of British Columbia for the year 1907 exhibits an increase over that of 1906 of $758,437. The Provincial Mineralogist's published figures show production as under:—

	Quantity.	Value.
Gold, placer		$ 700,000
Gold, lode ..oz.	199,770	4,129,246
Total gold		$ 4,829,246
Silver ..oz.	2,940,190	1,852,320
Lead ..lb.	48,309,660	2,318,864
Copper ..lb.	38,392,264	7,678,453
Total metalliferous		$16,678,883
Coal (tons of 2,240 lbs)	1,856,600	6,498,100
Coke (tons of 2,240 lbs)	227,000	1,362,000
Other minerals (building materials, etc.)		1,200,000
Total production in 1907		$25,738,983

In arriving at the approximate value of the several metals as shown above, the average market prices for the year, as published in the *Engineering and Mining Journal,* have been taken, with a deduction of 5 per cent. off the price of silver and 10 per cent. off that of lead. For coal and coke what was considered a fair market value in British Columbia was taken. Accordingly the respective prices were as follows: Lode gold, $20.67 per oz.; silver (net), 63 cents per oz.; lead (net), 4.8 cents per lb.; copper, 20 cents per lb.; coal, $3.50 per long ton, and coke, $6 per long ton.

For purposes of comparison the following table, showing production over a period of two years, is submitted:—

Comparative Table Showing Quantity and Value of Mineral Products for Two Years, 1906-1907 (last year estimated).

	1906.		1907.	
	Quantity.	Value.	Quantity.	Value.
Gold, placer ..oz.	.....	$ 948,400	.....	$ 700,000
Gold, lode ..oz.	224,027	4,630,639	199,770	4,129,246
Total gold		$ 5,579,039		$ 4,829,246
Silver ..oz.	2,990,262	1,897,320	2,940,190	1,852,320
Lead, ..lb.	52,408,217	2,667,578	48,309,660	2,318,864
Copper ..lb.	42,990,488	8,288,565	38,392,264	7,678,453
Total metalliferous		$18,432,502		$16,678,883
Coal (tons 2,240 lbs.)	1,517,303	4,551,909	1,856,600	6,498,100
Coke (tons 2,240 lbs.)	199,227	996,135	227,000	1,362,000
Other minerals (building materials, etc)		1,000,000		1,200,000
Total production		$24,980,546		$25,738,983

The approximate total value of the production of metalliferous minerals in 1907 was, with the exception of that of 1906, the largest in the history of metal mining in the Province. As compared with 1906, though, there was a decrease of $1,753,619. This loss was, however, more than compensated for in the considerable increase in the production of non-metalliferous minerals, chiefly coal, although coke contributed $366,000 and building materials, etc., $200,000, of this increase, the balance $1,946,000) representing the proportion from coal.

Taking the various minerals separately, as shown respectively in the tables of production, the following comments are made:—

Gold.

As already mentioned, the production of placer gold in 1907 was smaller than in any other year since 1898, and this notwithstanding that water conditions seemed, early in the season, to promise a favourable year for hydraulicking. It is possible that the revised figures, when the official returns shall all have been received, will prove the estimate now published to have been too low, yet while some gain may be made it is unlikely it will be sufficiently large to bring last season's production up to that of 1906. The districts which produce most placer gold in the Province are Cariboo and Cassiar. In the former Quesnel division had the assistance of a property taken over two years ago by a Guggenheim company which recovered about $20,000 against nothing for 1906, while the Cariboo division was understood to have had several properties at work that had been idle several previous seasons, yet the preliminary advices record a total decrease of about $150,000 in the total recovery throughout both divisions of this district. Atlin camp, for years the largest contributor of placed gold in British Columbia, is also reported to have made a smaller production than during any one of the three immediately preceding years—1904-1906—its decrease being shown as approximately $100,000 The production of individual miners from Atlin creeks has been steadily becoming smaller for several years, yet it was expected that the operations of the Ruffner, Hamshaw, Guggenheim and other companies would have in the 1907 season more

*Editor *British Columbia Mining Record.*

than made up for such loss. It is understood that the creek gravels suitable for hydraulicking are by no means exhausted, so that given favorable conditions for working them returns may be expected to show a substantial increase next season. Dredge mining in this camp has proved a failure, and has been abandoned for the time. Possibly it may be tried again later; if so it should be by men thoroughly experienced in that class of mining.

The $500,000 decrease in the value of lode gold was due to the smaller production of the Boundary and West Kootenay districts, and chiefly owing to a suspension of mining and smelting operations during two to three months of the year. The bigger gold-quartz mines of the Province did not contribute nearly so large a proportion of the total as might reasonably have been looked for. In fact the only one that made anything like a fair showing was the Nickel Plate in the Lower Similkameen, with a production estimated at between $400,000 and $500,000. In Nelson mining division the Ymir mine made a poor showing as compared with its production of several years ago. On the other hand the Queen, Second Relief, Kootenay Belle and Arlington, all in the Salmo-Erie section of this division, together produced between $200,000 and $300,000, and the Fern and Granite, both within a few miles of Nelson, also added to the total. In the northern Lardeau, the Eva mine, near Camborne, was the only gold mine that made a production worthy of mention.

Silver.

The production of silver was practically the same as that of 1906—not quite 3,000,000 oz. In round figures, West Kootenay produced about 1,300,000 oz., East Kootenay 950,000 oz., Boundary something like 600,000 oz., and the Coast district about 80,000 oz. While the decrease in quantity was not considerable, the expectation was that the change would be the other way, since in Lardeau district the Silver Cup mine made an appreciably large increase over its 1906 output, in Ainsworth several mines together did similarly, and in the Slocan and Whitewater in the camp of that name, and the Rambler-Cariboo, Standard, Hewitt, Vancouver group, and Arlington, among others, all made a higher production than in the year immediately preceding. These gains, however, were insufficient to offset the decreases in East Kootenay and the Boundary. It is pleasing to note that there is believed to have been a distinct improvement in the Slocan, which is a change for the better not generally known to have taken place.

(To be continued.)

THE SIXTEENTH ANNUAL REPORT OF THE ONTARIO BUREAU OF MINES.

(Continued from last issue.)

Oil and Gas in Kent.

The country in which lie the Romney and Tilbury oil fields is covered with drift. It is thus doubly unfortunate that full records of the data regarding underlying formations have not been kept during the sinking of the wells.

In 1905 the Bothwell field was producing some 6,000 barrels of oil per month. This was the first and for some time the only producer. In March, 1907, there were 150 wells drilled in Tilbury, of which only 4 were dry. On July 1st the number of producing wells was 235. There were also 33 dry holes and 26 new wells being drilled. In the Romney pool, at the same date, there were 47 wells, of which 24 were dry. The production of oil from the Tilbury and Romney field is given by the Imperial Oil Company of Sarnia, who purchase the entire flow, as follows:—

East Tilbury—

No. of bbls. of 35 gallons from Dec., 1905, to end of June, 1906	4,000
July	4,315
August	13,897
September	14,651
October	23,679
November	26,558
December	28,101
1907.	
January	29,172
February	26,098
March	29,600
April	31,055
May	35,004
June	35,654

Romney, 1907—	Bbls.
January	2,871
February	5,939
March	11,104
April	9,685
May	5,534
June	3,163

The Romney field is handicapped by lack of water for boilers. Also it has little natural gas. Gas is to be piped from Tilbury.

The total oil produced in Toronto in the first six months of 1907 was slightly more than 400,000 bbls. Of this the Tilbury and Romney fields produced more than half.

The Sarnia refinery has a capacity of 75,000 bbls. per month. It is worked to full capacity, and any falling off in Ontario's production is made good by importation from the United States.

In July last Tilbury crude oil brought the operator $1.16 per bbl.; Romney oil, 84 cents per bbl. In addition to this there is a Government bounty of 52 1-2 cents per bbl. Including United States producers, the price per bbl. ranges from 28 cents to $1.68 1-2. The latter figures includes bounty.

The color of the Tilbury oil in bulk is a dark green olive. In thin layers it assume a pale yellow shade. It is 38 degree to 41 degrees Beaumé.

The Romney oil, described by refiners as "dead," contains a high percentage of sulphur. A small quantity of naphtha is extracted from it and the balance is sold as fuel. It is about 28 degrees to 30 degrees Beaumé.

There are several important gas wells in East Tilbury and Raleigh. During May and June, 1907, the City of Chatham drew its whole suply of natural gas from one well on the David Halliday farm in the northwest part of lot 1, in the sixth concession of Raleigh. The well is 1,421 feet deep. Gas was struck at 1,417 feet. It is lined with 3 inch tubing, and packed with a dresser packed. It was closed in on September 16th, 1906. The gas is conveyed 10 miles to Chatham in a surface pipe 3 inches in diameter. This is to be replaced by a 6 inch pipe. The rock pressure of the gas is said to have decreased to 460 lbs. to the square inch, but when first measured it was 650 lbs. It is conveyed to the city at a pressure of 200 lbs., when it is reduced to 60 lbs. At the Chatham Gas Company's works it is further reduced to 6 ounces, at which pressure it is delivered to the consumers.

Another well on lot 14, Middle road north, East Tilbury, gives 500,000 cubic feet per day. This will be used to supplement the Chatham supply.

The Chatham prices per 1,000 cubic feet range from a maximum of 35 cents down to 12 cents, according to quantity used. For domestic lighting and cooking it is 35 cents. For heating it is 27 cents per 1,000 for the first 100,000 cubic feet. For the next 50,000 the price is reduced to 27 cents. For any quantity over 150,000 the rate is 17 cents. For gas engine power the minimum charge is $37.50 per month on the assumption that not less than $250,000 feet per month will be used, which is at the rate of 15 cents per 1,000. Used under boilers the rate is 12 cents per 1,000 for any quantity. Artificial gas was formerly sold in Chatham at $2.50 per 1,000, with a discount of 30 per cent. for cash within 10 days. Nearly every farmer along the gas pipe line into Chatham now uses gas for lighting.

The Chatham Gas Company is preparing to purify the gas by removing the sulphuretted hydrogen.

Two other gas wells supply the adjacent country.

In the Romney field oil is struck at 300 feet. There are no gas wells proper. During the summer the largest oil producer was the Hornick Farm Oil Company, whose output was 100 bbls. per day.

Handling the Oil in Tilbury.—The oil is first piped from the different wells on a farm into one or two tanks. Thence to a large central station; and then to the railway station tank at Merlin. Pipe lines have been installed to carry the oil from the wells to the central storage tanks and pumping station. The main tank is of steel and has a capacity of 3,840 bbls. Other tanks bring the total capacity up to 6,000 bbls. The oil is conveyed in two pipe lines, 4 inch and 2 inch, to Merlin, four and one-half miles, under 200 to 400 lbs. pressure. As much as 3,500 bbls. can be sent in ten hours. At Merlin the oil flows by gravity into the cars.

One one farm there were nine producing wells. The power for pumping is supplied by a gas engine run by natural gas. The power plant is placed in a central position. Surface rods run to each well, at which a pump is placed. The pumps are run simultaneously by these rods. The local tanks usually have a capacity of 250 bbls.

Drilling is contracted for at rates of from 85 cents to $1 per foot in Tilbury. Most of the wells are about 1,400 feet deep. Shooting with nitro-glycerine entails an additional cost of about $175. The cost of lining brings the total outlay to about $3,000. If the well proves a "duster" the casing is removed and the operator loses. Twenty-five days are usually taken to drill a well in Tilbury. In the Romney district the shallow wells are drilled with much less outlay.

(To be continued.)

ONTARIO'S MINING PROGRESS IN THE LAST DECADE.

By Phillips Thompson.

In no respect has the industrial expansion of the Province of Ontario during the last decade been more apparent than in connection with its mining and metallurgical activities. Owing to the discovery of new mineral deposits and the investment of large amounts of capital in mining and metallic industries, the increase in production has been considerably greater than in any other department of industry. Especially is this true of the later portion of the period under consideration. In 1897 the total mineral output was valued at $3,899,821, of which only $1,038,089 was metallic. Up to that time, and for some years later by far the larger proportion of mineral production consisted of non-metallic items, including building stone, brick, lime, etc. In 1901(however, the metallic output had increased to $5,016,734, or 42 per cent. of the total production, and in 1905, for the first time, the metallic exceeded the non-metallic output, being $10,201,010, out of a total production of $17,854,-296. This figure, which was the highest record in the history of Ontario mining, was considerably surpassed in 1906, with a metallic production of $13,179,162 and a non-metallic output of $9,042,646, making a total of $22,-221,808. Partial returns, covering the first nine months of 1907, indicate that the advance has been continuous.

With the exception of pig iron, silver holds the first place on the list of metals. Prior to the development of the Cobalt deposits its production had for some years been declining. A drop in the price of the metal resulted in the closing down of mines formerly large producers in the Port Arthur district. The output in 1902 had decreased to $58,000 in value, and in 1903 to $8,949. The discovery of the silver-cobalt nickel ores in the fall of 1903 in the course of construction work on the Temiskaming & Northern Ontario soon attracted widespread attention from mining men and capitalists, and a rush of prospectors to the new camp took place during that and the following year. Practical mining operations were speedily set on foot, the output of the camp for 1904 being 158 tons of ore, yielding in addition to other values 206,875 ounces of silver, valued at $111,887. This year witnessed the beginning of operations on the Nipissing, La Rose, McKinley-Darragh, Trethewey, Coniagas and other prominent mines. During 1905 the number of shipping mines was increased to 16. The total production of silver for the year was 2,473,452 ounces, valued at $1,372,877. The output was entirely from the Cobalt field, with the exception of small quantities extracted from the residues of the Copper Cliff nickel mattes. This was more than doubled in 1906, the yield having risen to 5,357,830 ounces, valued at $3,543,089, with additional values of cobalt 312 tons, $30,819; nickel, 156 tons, and arsenic 1,558 tons. A great drawback to Cobalt mining operation has been the difficulty of obtaining satisfactory terms from the American smelters. At first they were paid for the subsidiary products, but latterly the smelting companies, alleging the refractory character of the ore, have as a rule refused to make any allowance for the nickel, cobalt and arsenic contents. Other difficulties arising out of fluctuations in the price of silver have occurred more recently as a result of which shipments have been to some extent kept back, with a view of obtaining better terms from Canadian smelters, now in course of construction. Many recent consignments have been sent to the smelter of the Canadian Copper Company at Copper Cliff, Ont., where the terms are regarded as comparatively favorable.

The season of 1907 was characterized by continued expansion and greater attention to systematic and thorough development work on the part of producing mines. Early operations were largely conducted by crude, primi-

tive methods, which proved remunerative when applied to rich deposits lying near the surface. As the camp assumed more of a permanent character and deeper levels were reached the installation of modern machinery was soon found to be necessary, and the past year has witnessed the introduction of first-class steam and electric plants, with the most approved machines, on a large scale. All the important mines are now well equipped in this respect. The difficulty and expense attendant upon these installations has been very considerable and has only been justified by the confirmation of the extent and value of the deposits. Exploration has been pushed farther afield and discoveries made up the Montreal River and in the Temagami forest reserve, which foreshadow a wide extension of the silver-producing area. At the close of the year the number of shipping mines was 24. Returns to the Bureau of Mines covering the nine months ending September 30th give the output of silver as 6,919,987 oz., valued at about $4,312,000, which shows that notwithstanding a sharp decline in the price of the metal, the value of the entire year's output will mark a very substantial advance over the previous year's yield.

Iron and steel manufacture have made remarkable progress since 1897, consequent upon the discovery and utilization of large ore deposits and the development of the secondary processes of manufacture, stimulated largely by the heavy demands for railroad construction and the encouragement of the bounty system. In 1897 pig iron was produced to the amount of 24,001 tons, of the value of $288,127. The ore from which it was made was all or nearly all imported. In 1900 the pig iron product had increased to 62,386 tons, valued at $936,066. Iron ore was produced to the amount of 90,302 tons, value $111,805, of which 22,887 tons were smelted in Ontario, the remainder being exported. The marked increase of the iron ore output in 1900—amounting to 73,391 tons in quantity and $80,854 in value—was due to the opening of the Helen mine at Michipicoten. Markets were furnished for Canadian iron ore by the establishment of blast furnaces in Hamilton, Deseronto and Midland, and the progress of the mining industry was greatly stimulated. In 1901, 273,538 tons were produced, the greater proportion from the Helen mine. The quantity smelted in Ontario was 194,510 tons. The pig iron output was 116,370 tons, of the value of $1,701,703. Steel, which appeared on the list for the first time in 1900, when the output of 2,819 tons was valued at $46,380, increased in 1901 to 14,471 tons, worth $347,280. The following year witnessed a still more notable expansion. The iron ore produced for 1902 was 359,288 tons, worth $518,445, the pig iron product, 112,687 tons, value $1,683,051, and the steel output, $68,802 tons, valued at $1,610,031. In 1905 iron ore was produced to the amount of 211,597 tons, value $227,909, the pig iron output had increased to 256,704 tons, value $3,909,527, and steel to 138,387 tons, value $3,321,884. Latterly a good deal of fluctuation was occasioned by financial difficulties of the Lake Superior Corporation, controlling the Sault Ste. Marie industries, necessitating the temporary suspension of their mining and iron manufacturing operations. These having been overcome, productive activity has for some time been resumed. In 1906 the output of iron ore was 128,099 tons, worth $301,032, and that of pig iron 275,558 tons, of the value of $4,554,247. Returns of the quantities produced during the nine months of 1907, ending September 30th, are as follows: Iron ore, 141,719 tons; pig iron, 180,663 tons; steel, 120,077 tons. A noteworthy feature of the industry during 1907 is the rapid development of the twin cities of Fort William and Port Arthur as an iron centre, owing to the opening of the blast furnaces of the Atikokan Iron Company at the latter point and the development of the extensive iron ore deposits of the Atikokan iron range as a source of supply. Another large deposit at Moose Mountain, north of Sudbury, is being developed by the Moose Mountain Iron Mining Company, Limited, access to it having been afforded by an extension of the Canadian Northern Railway. The establishment of large smelting works and subsidiary industries drawing their raw material from this source, either at Toronto or some other convenient point in Ontario, is in contemplation. Altogether the outlook for the rapid and steady growth of the iron mining industries and the various metallurgical branches dependent upon it is exceeding auspicious. The exhaustion of the American iron ore deposits will necessarily in the near future give increased value to Canadian ores and bring into the market many areas the working of which has hitherto been unprofitable.

The last two or three years have witnessed a marked expansion in the nickel-copper industry, the sole producers of the Sudbury district for some time having been the Canadian Copper Company and the Mond Nickel Company. The product is exported in the form of matte for treatment abroad. From an output of 14,034 tons of matte, with nickel values of $359,651 and copper values $200,067 in 1897, the yield had increased in 1905 to 17,388 tons of matte, produced by the Bessemer process, yielding value of $3,354,934 nickel and $688,993 copper. The nickel and copper values produced in 1906 were $3,836,419 and $998,548 respectively. Later returns appear to show that the figures for 1907 will at least equal these. The production of copper apart from nickel has been comparatively small of late, but it is hoped that with the resumption of activity at the old Bruce mines and application of modern methods of mining and treatment satisfactory results may shortly be obtained.

The production of gold, to which formerly a good deal of capital and enterprise was devoted, has not of late occupied so prominent a position among the mining industries of the Province. This is perhaps mainly due to the fact that much of the effort to develop gold mines was misdirected, even when honestly undertaken, and operations conducted on a scale and at a cost by no means warranted by the indications. Out of very many companies started with glowing anticipations, only a very few are still in the field. During the period under consideration the high water mark of production was reached in 1899, when 27,594 ounces of gold were produced, valued at $424,568. Since that time the yeld has fallen off, the value of the output being $99,885 in 1905, and $59,274 in 1906. During 1907 there was some activity in the Manitou Lake area, more especially in connection with the Laurentian mine. Recent discoveries of gold in the Larder Lake and Abitibi Lake areas and other points in Northern Ontario have resulted in many locations being taken up and the formation of numerous companies; but as yet little actual development has been done.

The output of zinc ore is small and fluctuating, the largest output being for 1899, when it was produced to the value of $24,000. In 1906 the yield was 400 tons, valued at $6,000, and the product for the first nine months of 1907 was about the same.

Mica takes an important place among the non-metallic products. The value of the output in 1898 was only $6,000. It had increase to $102,205 in 1903, but dropped

the following year to $37,847. The yield for 1906 was 355 tons, valued at $69,041. The industry was active during 1907 until the financial depression affected it adversely.

Talc first appeared on the list of mineral products in 1899, when the output was valued at $500. Its production has never attained large proportions, the highest figure being 1,235 tons, valued at $3,030, in 1906.

The production of graphite reached its highest point in 1900, when the yield was valued at $27,030. It had decreased to $9,825 in 1905, but the output of the following year was 1,772 tons, valued at $15,000.

Corundum was added to the list of mining products in 1900, with a yield valued at $6,000. Since then the output has been steadily increasing, the returns for 1906 showing a production of 2,914 tons, worth $262,448.

COAL MINING IN CAPE BRETON DURING 1907.

(By our own Correspondent.)

In looking over the coal production of Cape Breton for 1907, it is seen that outputs on the whole have been smaller than in 1906, and on the face of things it would appear as if little or no advance had been made. It would be very inaccurate, however, to imagine that any slackening of production is to be looked for in the future or that the industrial prosperity of Cape Breton has suffered any setback. The exact converse is the truth, for 1907 has been a year of steady development with normal outputs. The boom days are gone, we hope forever gone, together with the feverish uncertainty and abnormal inflation that characterise such periods.

Work throughout the year has proceeded very steadily and there has been no disturbing feature of any moment. The number of accidents during the twelve months have been in about the same ratio to tonnage as in previous years, and Cape Breton probably occupies the proud position of producing more tonnage per accident than any other coal mining district in the World. It is a matter for congratulation that no one accident involving the loss of more than three lives has occurred during the year.

The coal trade was greatly hampered in the spring by exceptional storms and by heavy fields of drift ice, along the shores of the Island, which persisted until the middle of the month of June. At least a fortnight of March was lost time by reason of snow storms, and on the 7th March Cape Breton was visited with a blizzard of a severity that will be long remembered. The weather conditions of the spring were chiefly responsible for the lower outputs in 1907.

The scarcity of labor was perhaps not so pronounced as in 1906 and 1905, but nevertheless at many of the mines men were scarce. There was no scarcity of general laborers or surfacemen, on the contrary in fact, but miners and under-ground workers generally, were in great demand, particularly at the smaller and remoter collieries on the western side of the Island. In common with the rest of the world Cape Breton suffered from a marked decrease in the productive force of labor, and at every colliery the tonnage produced per man employed was lower than in any previous year. This same phenomenon, for phenomenon it is, has been noticed and commented upon in the United States, in Great Britain, in Germany and in Belgium, and whatever the reason may be it is a fact that the miner of to-day is producing less coal than he has done previously. Although the output in Cape Breton during 1907 fell below that of 1906, the number of men employed was greater in 1907 than in the year preceding.

Taking the collieries from East to West in order, we come first of all to the Port Morien Basin mine, known for many years as the Gowrie mine. The old Gowrie and Blockhouse Company has been acquired by the North Atlantic Collieries Company, a corporation in which Mr. Ochiltree MacDonald and Mr. F. B. Pearson are prominently interested. The mine is at present producing about 200 tons a day, and it is expected next summer to raise this to 500 tons. The new company is making numerous improvements in plant and general layout and are spending a large amount of money on developments. At present about 200 men are employed in all.

The Broughton Colliery site, which lies back of Port Morien and the areas of the Dominion Coal Company, is quite deserted. The Broughton enterprise was ill starred, like almost every purely English mining company that has been operated in Cape Breton. English capital might yield better returns to the investors in Canadian enterprises if their engineers would take a little native advice. However this may be, Broughton Colliery is not likely to figure as a producer yet awhile.

A good deal has appeared in the press lately about the Cumberland areas, which lie in close proximity to those of the Broughton people. It is stated that the Dominion Iron & Steel Company have obtained an option on them, and will straightway proceed to develop them on a royalty basis. These areas have been only slightly prospected and very little is really known about them. The Steel Company have several drills at work on the ground at the present time. The district is a more or less troubled one, lying as it does between two anticlines, and considerable prospecting will be needed before any large expenditure is justified, so that it is not probable that any immediate development is to be looked for. The Steel Company have spent a lot of money during 1907 on prospecting, having put down bores in several places at the head of Lingan Bay, and in the more or less unexplored territory between that place and Kilkenny Lake, outside the supposed outcrop of the Mullins Seam.

The Dominion Coal Company's mines have passed an uneventful year, work having proceeded very steadily without any particular interruptions. The outputs for the various mines comparing 1906 with 1907, were as follows:—

	1906.	1907.
No. 1 Phalen	528,160	498,948
" 2 Phalen	609,140	638,579
" 3 Phalen	365,236	348,383
" 4 Phalen	545,003	520,254
" 5 Phalen	587,824	635,903
" 6 Phalen	113,467	204,616
" 7 Hub	146,412	4,483
" 8 Harbor	229,636	224,097
" 9 Harbor	380,320	363,873
" 10 Emery	47,818	100,617
Total	3,552,746	3,539,753

The outputs of the Phalen seams are about the same with the exception of the new mine at Big Glace Bay, No. 6, whose output is steadily increasing. It is expected that in the summer of 1908 this mine will be producing 1,000 tons per day.

The Hub Colliery was pumped out early in November and is again producing coal. It will be remembered that this mine got on fire in December 1906, and in order to extinguish the fire it was necessary to let in the Atlantic Ocean. Most of the year has been occupied in pumping out the workings and replacing the surface erections which were wiped out by the fire. The work of pumping out was slow owing mostly to the virulent manner in which the Hub pit water attacks metals. Several peculiar phenomena were noticed in pumping out this mine. When the sea water was allowed to flow into the workings the Bay was full of "lolly" ice which flowed in with the water. At water level this formed a substance like coarse sea salt, which was left in the roadways as the water receded. In the broiling days of the summer it was strange to see this reminder of the drift ice of the spring. This frozen substance absorbed enormous quantities of the carbonic oxide, which was formed by the smothered fire, making the task of removing it somewhat disagreeable to the workmen. As soon as the mass was disturbed by the shovel the carbonic oxide diffused itself into the atmosphere, making the lamps to burn brightly and giving the men more or less headache.

The mines on the Harbor Seam kept about the same production as in the previous year.

The new longwall mine on the Emery Seam produced about 100,000 tons in the year. A good many hindrances have been met with in opening out this mine, due chiefly to the difficulty of obtaining miners accustomed to longwall workings. This difficulty is now almost overcome, and during 1908, No. 10 will probably produce 150,000 tons. The Emery Seam is a hard bright coal, very suitable for household or steam purpose and will be very popular some day.

The Coal Company's new mine at Victoria has two slopes, each down about 300 feet. The Victoria seam at this point is about 6 feet 3 inches thick with an excellent analysis. The dip is about 1 in 4, and the face of the deeps is about half a mile from the sea, having 60 feet of cover at the present face. In the system of working to be adopted, advantage is to be taken of the grade in handling the coal underground. The rooms will be opened out to the rise, the full tubs being let down to the level by means of a gravity balance, which will at the same time haul the empty tub to the coal face. Small gathering haulage engines will be placed at the ends of the levels to convey the coal to the main haulage ropes. A small temporary plant is now installed, with boarding houses, etc., and about 75 men are working at the site. The railway from Grand Lake where the No. 12 branch will join the main line of the Sydney & Louisburg Railway is being rapidly graded, and will be completed in 1908.

During the year the Dominion Coal Company have made a good many additions to their plant and equipment. At No. 2 Colliery the Compressor House was enlarged and in addition to the compressors, now contains three 600 KW. generators, driven by 700 H.P. horizontal steam engines. This plant is intended to supply electric power to all the Glace Bay district collieries for pumping, screening, etc. A general scheme of electric pumping and haulage is being installed at the collieries for which the power is to be supplied from the No. 2 Power House.

Two new locomotives and a steam shovel have been added to the railway equipment, and a wrecking plant for assisting distressed shipping is now installed in a special building at Glace Bay.

Many advances in the way of safety have been made. Safety lamps are now in use in all the mines, and naked lights have very wisely abandoned altogether. The use of ordinary and compressed powder has been discontinued in dusty mines, and a high explosive is now used. The system of independent shotfiring is altogether done away with, and shots are now lighted by a responsible official. Unexpected inspections of the miners' clothing are made, and several men found with matches in their possession have been detected and punished. It is not by chance or altogether by reason of naturally safe mines that Cape Breton has been spared a disaster like those that have wrought such havoc in the States. Safety is the outcome of eternal vigilance, in which particular the present management of the Dominion Coal Company are not lacking.

A Rescue Building equipped with twenty Draegar breathing apparatus has been erected during the year, and a trained expert is now stationed there whose occupation it will be to train corps of men in the use of these apparatus. Their nature and use have been explained in the columns of the JOURNAL. In view of the recent explosions in the States and the futile attempts at rescue work there, the initiative of the Coal Company has been very abundantly justified.

The Nova Scotia Steel & Coal Company, like the Dominion Coal Company have a lessened annual output, but they have also like their neighbors been prosecuting necessary development work. The new mine at Point Aconi has commenced operations, and the branch line 2 1-2 miles connecting the colliery with the main line is also completed. No. 2 Colliery at Lloyds Cove, which was abandoned in 1904, is now being pumped out, and will be ready to hoist some time next spring.

Both the Nova Scotia Steel Company and the Dominion Coal Company have during 1907 built a good many workmen's houses, and both companies are selling these houses to their workmen on an easy instalment plan, which is being quite largely taken advantage of, the rate of interest being only 6 per cent., and the lot sold at a nominal figure. The Nova Scotia Steel Company have also installed an electrically driven haulage at their No. 5 Colliery. Electric power and electrically driven machinery is steadily increasing in favor in Cape Breton.

The production of the Nova Scotia Steel Company's collieries during the year, was as follows:—

No. 1	256,161
" 3	296,466
" 4	3,128
" 5	82,310
Total tons	638,065

The output of the Inverness Railway & Coal Company will be in the neighborhood of 250,000 tons, and will be about 40,000 tons in advance of 1906.

The trial of "Steel vs. Coal" which took place at Sydney before Judge Longley at midsummer, added a little to the gaiety of the Canadian nation. All the readers of the JOURNAL are of course familiar with the circumstances, and know all about Judge Longley's buttonhole, the pyrotechnic cross-examination of Sir Wm. Van Horne and Mr. F. P. Jones' two days on the witness stand; with Mr. Nesbitt's slightly theatrical eloquence and Mr. Lovett's monotonous, and at the same time, incisive logic. The course of the appeal trial at

Halifax, in December, brought out very little that was not said at the first trial. The decision of the full bench is expected about the middle of January, and until the case is finally disposed of, comment on the merits of the points under dispute would be superfluous and unwise.

No industrial disputes have occurred in Cape Breton during the last twelve months. The P. W. A. took the aggressive during the spring of the year, and refused to work with non-unionists. Their action resulted in several days of idleness, but the ultimate result was that most of the non-unionists joined the Association.

The three years' agreement between the P.W.A. and the Dominion Coal Company expired with 1907, and the men refused the Coal Company's proffer of a renewal of the contract upon the old term. The have made a demand on all the coal operators of Nova Scotia for a 15 per cent. increase on day labor, for a minimum fixed rate of $2.44 for all miners out of places, employed temporarily at other work, and for higher wages to all night shift men. The Dominion Coal Company announced on December 5th, that they would put a new schedule of rates into effect in the 6th of January. This schedule raises the price of workmen's coal from 90 cents, inclusive of hauling, to $1.50 for runmine and $1.00 for slack, exclusive of hauling; makes a cut of 4 1-2 cents in the pillar rate, and a few minor changes in the cutting rates. The whole of the gain to the company under these changes is to be applied in increasing the wages of the day laborer and loader, or in other words, the amount of money disbursed on the Coal Company's payrolls is to be more fairly distributed amongst its employees at the mines. The P.W.A. have applied to the Minister of Labor for a Board of Conciliation and Investigation under the Lemieux Act, and have appointed their representative in Dr. Arthur Kendall, M.P. Further developments will be awaited with interest, but no one thinks that any serious trouble will arise.

To sum up, we think it is safe to prophesy that from now on the coal production of Cape Breton will very steadily increase. Many of the older mines are becoming less productive, but new developments are under way to take their place. While many portions of the Dominion are feeling the pinch of poverty and financial tightness, Cape Breton is a place where work is plentiful and prosperity apparent. The revenues of Cape Breton are not dependent on the vagaries of the weather, and although we are very far East here, Cape Breton in many respects offers inducements that the much advertised West does not, particularly to the working miner.

THE TYRRELL PRIZE.

For the best Collection of Ontario Minerals.

We are authorized by Mr. J. B. Tyrrell, mining engineer, to state that in order to encourage investigation into the mineral resources of the Province of Ontario, he will give a prize of $100.00 in cash to any Canadian, not in the employ of a public institution or mineral dealer, who will personally make the best collection of minerals in the Province of Ontario during the year 1908.

The collection must consist of thirty or more mineral species.

Each specimen must be labelled with the exact locality from which it was obtained and the date on which it was collected. No specimen will be considered unless it is so labelled.

As far as possible all minerals must be correctly named.

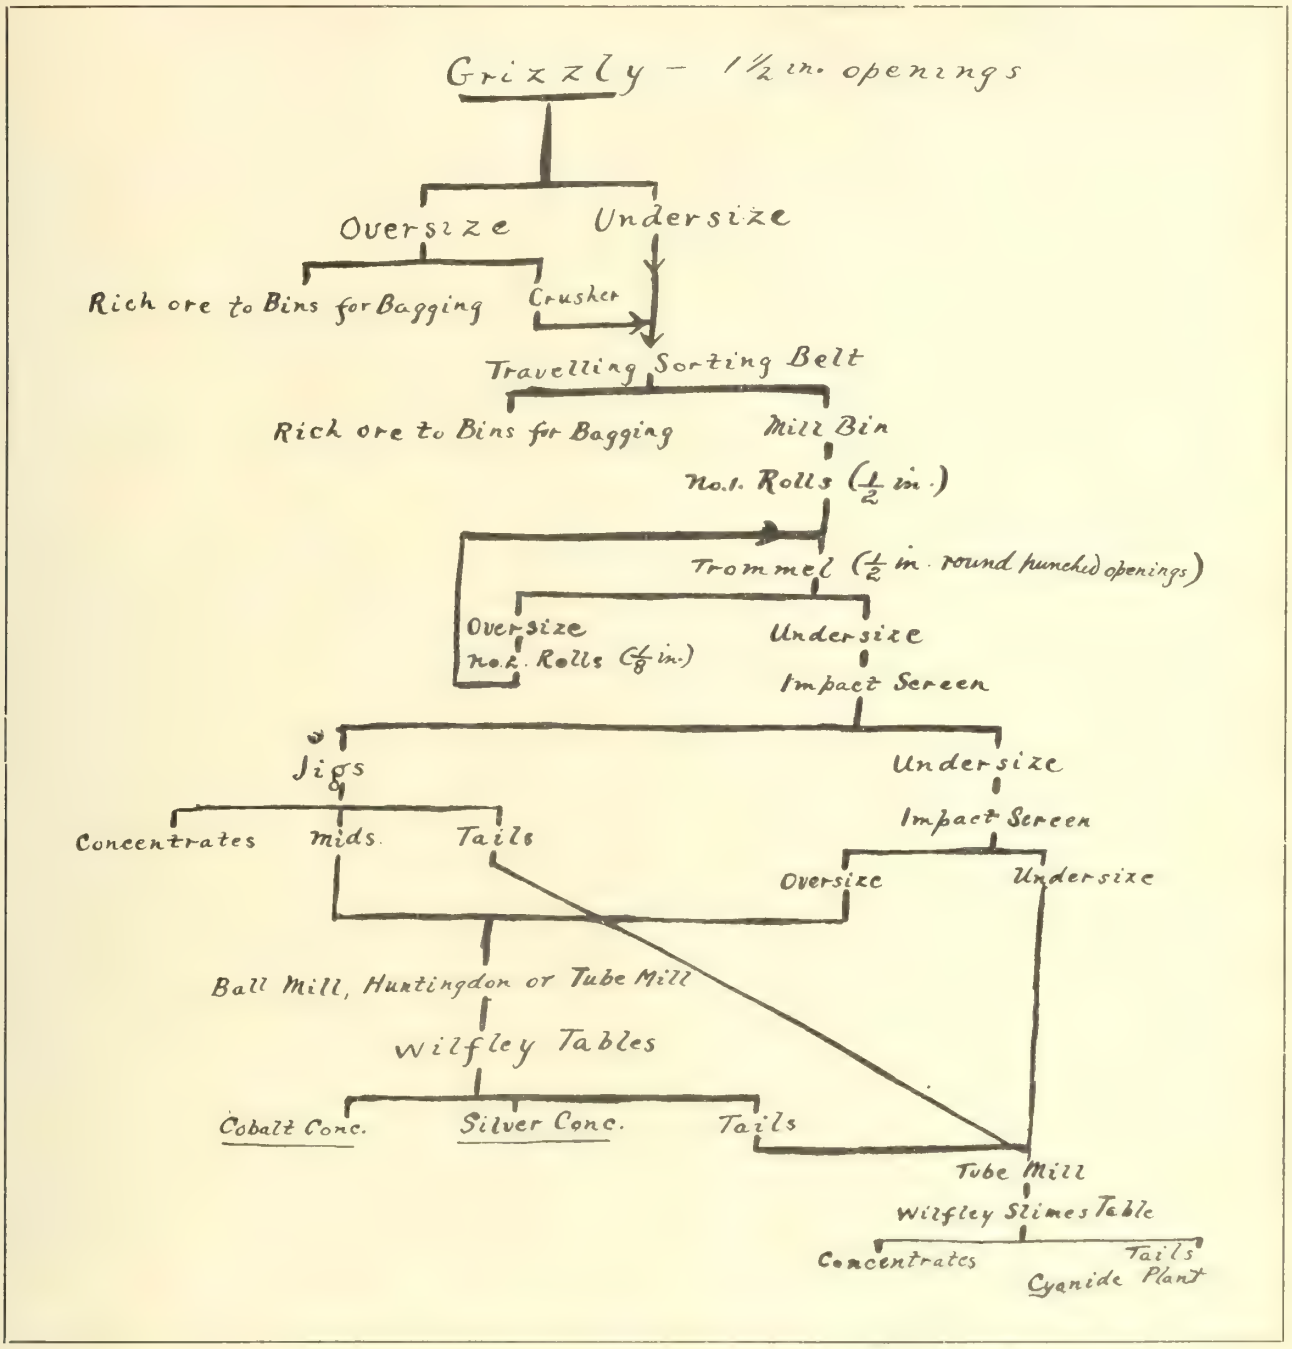
A typewritten list of the specimens, with names of minerals and localities, in triplicate, along with a declaration stating that they were personally collected by the signer in the Province of Ontario in 1908 at the locality stated, must be sent in with each collection.

Prof. T. L. Walker, of Toronto University and Prof. W. Nicol, of Queen's University have kindly consented to examine the collections and award the prize, and the collections must be sent to them at some place which they will designate later, on or before the 1st of December, 1908. After the prize is awarded the collections may again be obtained by the owners.

ONTARIO'S ESTIMATED OUTPUT—1907.

T. W. Gibson, Deputy Minister of Mines.

The mining industry in Ontario reached high-water mark in 1907. Of silver and nickel, the two chief metallic products, the output was large. The Province is now contributing to the world's store of silver a quantity surpassed by three States of the American Union only. For the twelve months just closed the production of silver in Ontario may safely be estimated at not less than 9,000,000 ounces, practically the whole output being from the mines of Cobalt. The rise of this camp has been rapid; in 1904, which was the first year of production, some 206,875 ounces only were obtained. The whole yield down to the end of 1907 may be placed at about 22,000 tons of ore, containing 17,100,000 ounces of silver.



The production of the Sudbury nickel fields was on a scale similar to that of last year, when there were raised 10,776 tons of nickel and 5,260 tons of copper. In nickel Ontario easily leads the world, her only competitor, New Caledonia, having been left behind some years ago.

In iron ore the bulk of the tonnage still comes from the Helen mine, but the magnetite deposits of Moose Mountain, Bessemer, Atikokan, Wilbur and elsewhere are beginning to assume considerable importance. It is in every way likely that large shipments from all the points named will be made during 1908. The production of iron ore during the first nine months of 1907 was 141,719 tons. There are now seven iron furnaces in the Province, two having been added during the past year —one at Hamilton and one at Port Arthur.

There were important developments in the petroleum and natural gas fields of Ontario in 1907. The Tilbury East oil field is now producing nearly as much as Petrolea and Oil Springs, and the gas area of Tilbury and Romney is being steadily extended, especially towards the south. Other non-metallic products contribute to the general total, among them being salt, corundum, iron pyrites, feldspar and mica, most of which are produced chiefly in the eastern part of the Province.

The heavy fall in the prices of silver and copper will probably tend to keep down the production of these metals, especially the latter, in 1908. But despite temporary checks, the progress of mining in this Province, which has been most marked during the last few years, can hardly fail to continue at a similar, if not a greater rate.

Bgeinning January 1st, 1908, Mr. C. L. Rameau will be general manager of the West Canadian Collieries, Limited, with head office at Blairmore, Alberta. In future all communications should be addressed to Mr. Rameau.

COBALT ORE TREATMENT.

This flow sheet is gotten out to indicate the method which appears to the writer to be the most economical for handling the ores of Cobalt. In practice probably some of the mines would find it more advantageous to use several sets of jigs, in which case I would advocate single compartment jibs for No. 1, the tails being crushed in No. 2. Rolls and undersize from No. 1 trommel elevated back to the mill bin.

No. 1 tails and undersize from No. 1 impact screen through No. 2 rolls to No. 2 impact screen. Oversize to No. 2 jigs. Undersize either to table mill with tails or to No. 3 rolls—if a further set of jigs is found profitable. In such case No. 3 jigs would probably be of the four compartment type, giving separate concentrates of silver and cobalt. Mids to mill for tables and tails to tube mill for cyanide.

Such a system would have impact screens and jigs to handle products from 1-2 to 1-4, 1-4 to 1-8 and 1-8 to 1-16. The table mill should crush to 16 to 20 mesh, and the tube mill from 40 mesh up, the fineness being best determined after experiment with the ore handled. Tails would go to either tables or cyanide, depending on the cobalt and copper contents. Sliming the tails and using hot solutions and hot air agitation promotes the efficiency of the cyanide plant, and I believe that the multiplication of the jigs, which will decrease the capacity of the plant, will in most cases be unnecessary.

H. G. V. Adler.

Mr. W. A. Carlyle, of 62 London Wall, London, E.C., has been appointed consulting engineer to Le Roi Mining Company. Until last summer Mr. Carlyle was general manager of Rio Tinto Mining Company. Prior to this he was resident engineer at Rossland of Le Roi mine. Mr. Carlyle is a graduate of McGill University.

THE LARDER LAKE DISTRICT.*

R. W. Brock.

(Continued from last issue).

Lower Huronian.

On the upturned edges of the Keewatin and Laurentian, eroded into hill and valley, the Lower Huronian rocks were laid down. The actual contact between the Huronian and the Keewatin is usually concealed by drift. At certain points at least, the basal member of the Lower Huronian appears to be a breccia-conglomerate, carrying angular fragments of the Keewatin rock immediately underlying it, as seen on island CC[3], on the small patches of conglomerate left on Gold Hill, and along the shore near the Reddick claims. This rock does not appear to have any considerable thickness. It is succeeded by a thin band of quartzite, and the latter by a considerable thickness of slate. This is again succeeded by quartzite, which becomes coarser and contains a few boulders near its top, and is succeeded by a thick coarse breccia-conglomerate. The thickness of the various members of this group varies at different places. The slates must have a maximum thickness of at least several hundred feet, the quartzites one hundred and twenty-five, and the conglomerate several hundred feet.

The boulders of the conglomerate are rounded to angular, and vary in size from small pebbles to masses 10 or 12 feet in diameter. The great mjority are under a foot in diameter. They include all the Keewatin and Laurentian rocks recognized in the district, besides numerous boulders of red and of gray granite, jasper, and finely banded jasper-magnetite—Iron Ore formation.

Boulders of the Keewatin containing mineralized quartz veins cut off sharply at the edge of the boulder are not infrequent. These veins are mineralized by pyrite, galena, specularite, etc., just as the veins now found in the Keewatin. Boulders of the rusty weathering dolomite(?) with mineralized quartz are among these Keewatin boulders, showing that some of the mineralization of this district dates back to pre-Huronian times.

Certain beds of the conglomerate are apt to be rich in boulders of one kind of rock, and adjoining beds rich in another. The supply of boulders evidently came from alternating sources.

The conditions under which the conglomerate was laid down have not been deciphered. The most obvious explanation is that it is of glacial origin. In this case the basal conglomerate sometimes found, made up of fragments from the immediately underlying Keewatin, would represent uneroded and untransported remnants of the earlier Huronian beds, while the slates, quartzites, and upper conglomerate would represent more or less sorted glacial debris.

Some striated boulders of the conglomerate at Cobalt, found by A. P. Coleman,[4] have been taken by him as proof of the glacial origin of the Lower Huronian. The latter evidence, as pointed out by W. G. Miller, is not conclusive, as the rocks at Cobalt have been much disturbed, and some, if not all, of the striations to be seen on the boulders are to be accounted for by these movements, which have slickensided the boulders. Referring to the origin of the Cobalt conglomerate, Miller says:[5] "In the present state of our knowledge we have little warrant for claiming that the granite boulders, often two or three feet or more in diameter, and distant a couple of miles from exposures of the rock, indicate glacial conditions during Lower Huronian times, although we have no proof to the contrary."

The thickness and widespread extent of the conglomerate in Northern Ontario, where its general characteristics seem to remain constant throughout, the clean-swept and often rounded surfaces of the older rocks on which it is frequently laid down, and the extraordinary variation in the size of the boulders—these and other facts stated above regarding the conglomerate of Larder lake, furnish the strongest evidence yet found, for a glacial origin. But there are still difficulties in the way of its acceptance. The deposits cannot be said to have the appearance of glacial deposits. There has been no boulder clay recognized—the material has at least been re-sorted.

Many of the boulders have re-entrants; when polished they have often the form of boulders worn by river sand.

The Huronian is for the most part undisturbed and almost flat-lying. The slates might be expected to contain fossil remains, if animals with hard parts existed in the waters in which these muds were deposited. None, however, were discovered. Where examined, the Huronian rocks appeared to be barren of all trace of mineralization, except in places disturbed by later eruptions, where some quartz veins were occasionally developed. In the Cobalt district, however, the Lower Huronian is probably the chief mineral-bearing horizon.

Post-Lower Huronian.

At a few points, cutting the older rocks and the Lower Huronian, is an igneous rock which is in places a gabbro, in others a diabase. It is exposed on the north side of "A.A." island; on a reef near the east shore north of this island; on the east shore east of "R" island[6]: and at the head of Fitzpatrick's bay. In places it is a coarse feldspar-pyroxene or hornblende rock with red feldspar segregations like the diabase near Cobalt. At other places it is fine grained, with small lath-shaped feldspars and a pronounced ophitic structure. At the head of the southeast bay, at the south end of Fitzpatrick's bay, behind the cabin, its contact with the Lower Huronian conglomerate can be traced. The line of contact is irregular, the conglomerate is somewhat altered along it, while the diabase is finer grained, frozen tightly to the conglomerate, and in places becomes more basic with biotite distinctly developed. Its relationship here suggests a sheet of diabase intrusive between the conglomerate and the Keewatin. In other places it probably breaks up through the Huronian. On the little reef near the east shore north of Island "A.A." the diabase contains a segregation of epidote with a little quartz, calcite and copper pyrites.

Cutting the Keewatin and porphyry are dikes of basic rock, in which biotite, chlorite and hornblende are now prominent. It has little aplite stringers through it, which, however, may be segregations from its own magma.

Later than these dikes and cutting the Keewatin and Huronian, are dikes of a basic rock which probably represents a biotite-lamprophyre. The basic edge of the diabase resembles them somewhat, and they might possibly be intrusions of the diabase magma.

A line of disturbance of some kind extends northward from Larder City. The strike of the rock differs on either side of this line, and the conglomerate at Larder City, which contains similar boulders to the ordinary Huronian conglomerate is squeezed almost to a schist. The boulders are drawn out and flattened. The dikes

*Sixteenth Annual Report of the Ontario Bureau of Mines.

which cut it also show signs of pressure. This probably is a fault line, but as most of the ground about here is drift-covered and muskeg, the exact cause of this disturbance was not ascertained.

Glacial.

The exposed rock surfaces are usually rounded, polished, fluted and striated, furnishing evidence of extensive glaciation. Glacial erratics, some very large, are scattered round. The direction of ice movement as recorded by striations averages about 169 degrees astronomic. The local variations from this are very slight. The erratic boulders are much more numerous in hollows and protected places, while those still left on the rock surfaces are generally large, suggesting that these surfaces have since been wave swept. Further evidence of this is afforded by the deposits of sand and gravel which cover large areas, and by deposits of Saugeen clay—a well stratified

Quartz vein (white) in Keewatin greenstone. The quartz contains a little scattered chalcopyrite, galena, specularite, etc.

interbanded sand and clay in one-half inch to one inch bands.

The glaciation has cut away the weathered and rotted rock surfaces and scoured the pre-glacial valleys, sweeping away any of the old sands and gravels.

Boulder clay has for the most part been removed by the later water action, but at one or two protected points a little was believed to occur.

Ores.

In the limited time spent in the field only some of the claims could be visited. The claims which were considered locally to give the most promise, and to be typical of the camp were, however, seen. Most of the "showings" occurring in the band of rusty weather "dolomite,"(?) where seamed with quartz stringers, which is often the case near pegmatite or porphyry dikes, or in the Keewatin greenstone were mineralized with quartz near similar dikes. There are some well defined veins carrying a little pyrite or chalcopyrite, a few specks of galena, and perhaps zinc blende, and in places a good deal of specularite. Sometimes the latter is in rosetted form. Some of the quartz veins are several feet wide, swelling out in places to large masses 10 or 12 feet in diameter. The quartz veins seen by the writer looked very lean, and where sampled ran nothing but a trace, except in picked specimens rich in sulphides, which might go a few dollars per ton in gold and silver. Mr. N. L. Bowen, who is continuing the geological mapping, reports, however, that since the writer's departure a well defined quartz vein has been found on one of the claims of the Chesterville group, which furnishes good specimens of free gold.

On the Gold Hill claim, which has yielded some fine specimens showing free gold, the country rock is diorite (field name) cut by pegmatite. Stringers of quartz, with some feldspar, from six inches down, in width, traverse the greenstone in the neighborhood. The quartz is rather watery in appearance and holds a little copper pyrite, specularite and silicified inclusions of the country rock. A little pyrite is developed in the country rock near by, but very little in the quartz itself. Free gold occurs in places in the quartz, in the silicified inclusions of country rock and in the country rock near the stringers of quartz.

The claims on the silicified band of rusty weathering "dolomite"(?) that show values, have much the same characteristics. The "dolomite"(?) with its peculiar green serpentine mineral developed in bands, is seamed with reticulating quartz stringers from a few inches in width to miscroscopical dimensions. Some carbonate is often interbedded in the quartz or forms parallel bands with it. The country rock between stringers is frequently silicified to a quartzite-like material. The quartz contains a little pyrite and chalcopyrite, a few specks of galena and perhaps a little specularite. The quartz stringers are sometimes predominantly parallel to the strike, sometimes predominantly across it, and sometimes quite irregularly distributed. While somewhat rusted on the surface, the oxidation does not usually extend an inch in depth, where the clear unoxidized quartz is encountered. It is sometimes milky white and sometimes somewhat rosy and watery. Through it in places is sprinkled free gold, usually in fine particles, but sometimes in grains the size of a pea or in little plate-like masses.

At the bottom of the two pits on the Knott claim of the Reddick group, about 14 feet below the surface, the gold seems to be as abundant in the fresh quartz in the bottom as near or on the surface. The gold has a fine color and is evidently of a high degree of purity. On the Harris-Maxwell claim a small branching dike of black trap-like material cuts the quartz. The gold occurs in the quartz particularly round galena and near the little black dike. It is also found near the quartz stringers in the silicified country rock.

On the Reddick claim two sets of quartz stringers occur, running for the most part across the strike. The older set dips about 60 degrees east, and consists of a blue watery barren quartz. The others, which have a vertical or slightly westward dip, are of white milky quartz, which carries some free gold. They are later than and cut the former set of stringers. These stringers end rather abruptly at the edge of this band against a soft grayish schist. The width of the band of silicified and

veined dolomitic rock is not easily determined, as edges are rarely exposed. On the Knott claim at least 100 feet in width is exposed, all veined in much the same way, and, it is claimed, showing gold values for the whole distance. On the Harris-Maxwell the width exposed is still greater, and gold may be obtained at points scattered over this whole exposure.

Gold-bearing quartz stringers in serpentinized and silicified dolomite (?).

A shipment from the Harris-Maxwell of 1,500 pounds was sent during the winter to the mill at the School of Mining, Kingston. It returned $13.20 per ton. The hole from which this rock was said to have been taken was 6 or 8 feet across. It is claimed that the greenish silicified rock between the quartz stringers gave assay returns of $8 per ton.

Possibilities.

Very little development work has been done, the two fourteen foot holes in the Knott claim representing the most extensive development in the camp. It has not yet been proved what "run of mine" might be expected from any place. Some of the stringers are quite rich, but they seem to be too small and irregular to be mined by themselves, and it would appear that the whole rock would have to be taken. Over what area such material could profitably be mined and what it would run, can only be satisfactorily determined by mill tests. Several of the companies have ordered small stamp mills, and parts of some of them reached the camp before the spring break-up. Since then it has been impossible to get the complete plants in or to send out trial shipments, so that no such tests have yet been possible. One small mill on the lake, run on the custom basis, could probably furnish all the companies the information necessary regarding what might be pay ground, the probably values to be expected, and whether it is desirable to erect a mill on their own properties.

In many places this band of "dolomite"(?) rock contains very few quartz stringers, and often even when well-cut up by them and otherwise apparently quite promisisng, samples fairly taken will not yield values sufficiently high to warrant further attention. This rock, however, forms a long continuous band, a little north of the lake, and is exposed at several other places, so that there is a considerable area over which values might be found. On a few claims very fine samples of free gold, nicely disseminated through a considerable extent of rock, have been found. Further prospecting may increase the number of gold "showings." From the character of the quartz and gold, fourteen feet below the surface, it looks as if gold might continue to exist in a free state for some depth. Though the stringers with gold are small and irregular, and therefore make a rich workable ore uncertain, there seems to be a reasonable chance that at some points by mining the whole rock, a large tonnage of low grade ore may be developed, with perhaps occasional rich bunches. If further work and mill tests prove this to be the case, a few dollars per ton is easily won gold (as the gold here so far seems to be), would constitute good pay ore. With a sufficient tonnage and perfect transportation facilities even three dollars per ton might be made to pay. There are some claims, therefore, that are worth exploitation along these lines.

As might be expected from the number of "snow-stakings," the majority of the claims have little present or prospective value.

The gold occurrence bears some resemblance to the Lake of the Woods and Rainy River, but here the stringers are for the most part independent of the schistosity, while in Northwest Ontario, the quartz lay between the bands of rock.

It will be noticed that the "showings" so far discovered are all in the Keewatin rocks, and that the main mineralization has been accomplished in pre-Huronian times. The undisturbed Lower Huronian is here, so far as could be seen, absolutely barren. Its only chance would seem to be for an old Huronian placer deposit in the conglomerate, which the mineralized fragments of Keewatin in the conglomerate might seem to suggest as possible. The fact that waste by erosion exceeded atmospheric weathering prior to the deposition of the Huronian, lessens the possibility of such concentration, and the uncertainty regarding the origin of the conglomerate makes it impossible to give a definite answer to the question.

Open cut on the Harris-Maxwell, from which a shipment of 1,500 lbs. was made to the School of Mining mill at Kingston, which yielded returns of $13.20 per ton.

Where the Lower Huronian is disturbed by faulting and large intrusions of the later diabase, it might be mineralized. These are the conditions at Cobalt. The intrusions seen at Larder lake are small and the effects extremely local, but a small amount of mineralization has resulted. It is interesting to find cobalt bloom in a

calcite stringer on one of the Chesterville claims at the head of the northeast arm. On Wendigo lake, to the south of Larder lake, cobalt has also been found.

There is very little possibility of modern placers being encountered. The loose material and rotted rock surfaces have been removed by the heavy glaciation and scattered somewhere south. Since glacial times very little weathering and consequently very little concentration of gold in sands ad gravels has taken place.

North of Larder lake to Abitibi, the geological conditions appear to be much the same. Gold has been found at Abitibi, and at points between these two lakes, so that a very large extent of territory exists in which to prospect for gold, with fair chance for success.

A FILTER TUBE.

In a former paper on "A New Filter" "Journal American Chemical Society," Vol. xxvii., p. 287, and "The Chemical Engineer," Vol. ii., p. 39, the writer described an ash-free pulp filter made by acting on unwashed Swedish filter paper, in a ceresin vessel, with hydrochloric acid of 1.18 sp. gr., to which has been added a little hydrofluoric acid. The resulting pulp is stirred up with distilled water and is deposited under suction on filter-felt in a special filter tube. The filter is effective and rapid for most filtrations, and especially so in the case of barium sulphate, which is perfectly retained without a trace passing through, if the filter is well rammed down with the stamper shown in the sketch.

This method of filtration is very useful for the filtration of sulphides and other precipitates which are readily oxidizable and which should be filtered and washed with exclusion of air.

For large precipitates of iron and alumina the ordinary method of filtration is preferable.

The filter tube in present use is perhaps enough of an improvement on the form previously described to warrant this note. It consists of an ordinary carbon tube, one inch in internal diameter, provided with a device for supporting the filter and for pushing it out of the tube. This device is a glass tube passing through the stem of the filter tube and provided with a flattened and perforated bulb at the end as shown in the sketch. On this is a close fitting disc of piano or filtering felt on which the paper pulp is deposited. After filtering, the felt and pulp filter are pushed out of the tube and the filter is picked off with a brass forceps. If the tube is fairly uniform in diameter, and the end is neither flared or drawn in by heating in the flame, no precipitate will adhere to the sides. These tubes were made for me by Eimer & Amend of New York.

In many cases where rubber is not objectionable a home-made device is equally effective. The filter support is made of sheet rubber about 3-8 inch thick. Five small holes are made through it by use of a cork-borer. Another small hole is made in the centre in which is tightly fitted a glass rod small enough to pass through the stem of the filte tube and long enough to push out the filter.

For carbon filtration the tube is 3-4 inch in diameter and glass wool is used in place of the piano-felt, on which the finely divided, well ignited asbestoes is deposited.

Perforated platinum and porcelain discs have been tried with no advantage over the device above described. In some cases it is preferable to use a disc of washed filter paper in place of the piano-felt, but filtration is slower.

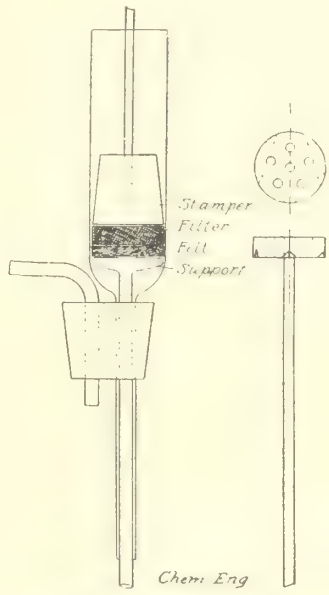

Diagram of Filter Tube.

Some of the advantages of this method of filtration, now in successful use in my laboratory for three years, are:—

First—Effective retention of fine precipitates like barium sulphate.

Second—Rapid filtration.

Third—Negligible ash.

Fourth—Filtration and washing with exclusion of air.

Fifth—More thorough washing, with less wash water, than by the ordinary method.

For further retails the reader is referred to the former paper noted above.—*The Chemical Engineer.*

MINING IN NEW MEXICO.

From figures recently published it is ascertained that New Mexico had, during 1906, 71 producing mines. The deep mines number 52, and placers 19. The total value of metals produced in 1906 was $3,203,730. Of this gold to the amount of 14,174 fine ounces ($293,019), and silver 491,127 fine ounces ($329,055) were recorded.

The average value per ton of ore handled in 1906 was $15.42, as compared with $16.21 in 1905 and $18.19 in 1904. The average value per ton in gold and silver for the silicious ores handled in 1906 was $16.69, as compared with $11.18 in 1905.

For the total tonnage of ore treated or sold from lode mines the following averages are given: 207,691 tons were treated. The average gold and silver recovered per tons was $2.99. This was divided as follows:

Silicious ore, average recovrey, gold and silver	$16.69
Copper ore, average recovery, gold and silver	2.41
Lead ore, average recovery gold and silver	2.14
Zinc ore, average recovery gold and silver	0.05

STANDARD METHODS FOR THE ANALYSIS OF IRON—AMERICAN FOUNDRYMEN'S ASSOCIATION.

H. E. Diller, Secretary.

Determination of Silicon.

"Weigh one gramme of sample, add 30 c. c. nitric acid (1.13 sp. gr.); then 5 c. c. sulphuric acid (conc.). Evaporate on hot plate until all fumes are driven off. Take up in water and boil until all ferrous sulphate is dissolved. Filter on an ashless filter, with or without suction pump, using a cone. Wash once with hot water, once with hydrochloric acid, and three or four times with hot water. Ignite, weigh, and evaporate with a few drops of sulphuric acid and 4 or 5 c. c. of hydrofluoric acid. Ignite slowly and weigh. Multiply the difference in weight by .4702, which equals the per cent. of silicon."

Determination of Sulphur.

Dissolve slowly a three gram sample of drillings in concentrated nitric acid in a platinum dish covered with an inverted watch glass. After the iron is completely dissolved, add two grams of potassium nitrate, evaporate to drynes and ignite over an alcohol lamp at red heat. Add 50 c. c. of a one per cent. solution of sodium carbonate, boil for a few minutes, filter, using a little paper pulp in the filter if desired, and wash with a hot one per cent. sodium carbonate solution. Acidify the filtrate with hydrochloric acid, evaporate to dryness, take up with fifty c. c. of water and two c. c. of concentrated hydrochloric acid, filter, wash and after diluting the filtrate to about 100 c. c. boil and precipitate with barium chloride. Filter, wash well with hot water, ignite and weigh as barium sulphate, which contains 13.733 per cent. of sulphur.

Determination of Phosphorous.

Dissolve two grams sample in fifty c. c. nitric acid (sp. gr. 1.13), add 10 c. c. hydrochloric acid and evaporate to dryness. In case the sample contains a fairly high percentage of phosphorous it is better to use half the above quantities. Bake until free from acid, redissolving in twenty?five to thirty c. c. of concentrated hydrochloric acid, dilute to about sixty c. c., filter and wash.

To make the molybdate solution add one hundred grams molybdic acid to 250 c. c. water, and to this add 150 c. c. ammonia, then stir until all is dissolved and add 65 c. c. nitric acid (1.42 sp. gr.). Make another solution by adding 400 c. c. concentrated nitric acid to 1,100 c. c. water, and when the solutions are cool, pour the first slowly into the second with constant stirring and add a couple of drops of ammonium phosphate.

Determination of Manganese.

Dissolve one and one-tenth grains of drillings in twenty-five c. c. nitric acid (1.13 sp. gr.), filter into an Erlenmeyer flask and wash with thirty c. c. of the same acid. Then cool and add about one-half gram of bismuthate until a permanent pink color forms. Heat until the color has disappeared, with or without the precipitation of manganese dioxide, and then add either sulphurous acid or a solution of ferrous sulphate until the solution is clear. Heat until all nitrous oxide fumes have been driven off, cool to about 15 degrees C.; add an excess of sodium bismuthate—about one gram—and agitate for two or three minutes. Add fifty c. c. water containing thirty c. c. nitric acid to the liter, filter on an asbestos filter into an Erlenmeyer flask, and wash with fifty to one hundred c. c. of the nitric acid solution. Run in an excess of ferrous sulphate and titrate back with potassium permanganate solution of equal strength. Each c. c. of No-10 ferrous sulphate used is equal to 0.10 per cent. of manganese.

Determination of Total Carbon.

This determination requires considerable apparatus; so in view of putting as many obstacles out of the way of its general adoption in case of dispute your committee has left optional several points which were left to bring no chance of error into the method.

The train shall consist of a pre-heating furnace, containing copper oxide (Option No. 1) followed by caustic potash (1.20 sp gr.), then calcium chloride, following which shall be the combusion furnace in which either a porcelain or platinum tube may be used (Option No. 2). The tube shall contain four or five inches of copper oxide between plugs of platinum gauze, the plug to the rear of the tube to be at about the point where the tube extends from the furnace. A roll of silver foil about two inches long shall be placed in the tube after the last plug of platinum gauze. The train after the combustion tube shall be anhydrous cupric sulphate, anhydrous cuprous chloride, calcium chloride, and the absorption bulb of potassium hydrate (sp. gr. 1.27) with prolong filled with calcium chloride. A calcium chloride tube attached to the aspirator bottle shall be connected to the prolong.

In this method a single potash bulb shall be used. A second bulb as sometimes used for a counterpoise, being more liable to introduce error than correct error in weight of the bulb in use, due to change of temperature or moisture of the atmosphere.

The operation shall be as follows: To one gram of well mixed drillings add 100 c. c. of potassium copper chloride solution and 7.5 c. c. of hydrochloric acid (conc.). As soon as dissolved as shown by the disappearance of all copper, filter on previously washed and ignited asbestos. Wash thoroughly the beaker in which the solution was made with 20 c. c. of dilute hydrochloric acid (1.1), pour this on the filter and wash the carbon out of the beaker by means of a wash bottle containing dilute hydrochloric acid (1.1) and then wash with warm water untill the acid is washed out of the filter. Dry the carbon at a temperature between 95 and 100 degrees C.

Before using the apparatus a blank shall be run and if the bulb does not gain in weight more than 0.5 milligram, put the dried filler into the ignition tube and heat the preheating furnace and the part of the combustion furnace containing the copper oxide. After this is heated start the aspiration of oxygen or air at the rate of three bubbles per second, to show in the potash bulb. Continue slowly heating the combustion tube by turning on two burners at a time, and continue the combustion for thirty minutes if air is used; twenty minutes if oxygen is used. (The Shimer crucible is to be heated with a blast lamp for the same length of time.)

When the ignition is finished turn off the gas supply gradually so as to allow the combustion tube to cool off slowly and then shut off the oxygen supply and aspirate with air for ten minutes. Detach the potash bulb and prolong, close the ends with rubber caps and allow it to stand for five minutes, then weigh. The increase in weight multiplied by 0.27273 equals the percentage of carbon.

The potassium copper chloride shall be made by dissolving one pound of the salt in one liter of water and filtering through an asbestos filter.

Option No. 1.—While a pre-heater is greatly to be desired, as only a small percentage of laboratories at present use them, it was decided not to make the use of one essential to this method; subtraction of the weight of the blank to a great extent eliminating any error which might arise from not using a pre-heater.

Option No. 2.—The Shimer and similar crucibles are largely used as combustion furnaces and for this reason it was decided to make optional the use of either the tube furnace or one of the standard crucibles. In case the crucible is used it shall be followed by a copper tube ends cooled by water jackets. In the centre of the tube 3-16 inch inside diameter and ten inches long, with its shall be placed a disc of platinum gauze, and for three or four inches in the side towards the crucible shall be silver foil, and for the same distance on the other side shall be copper oxide. The ends shall be plugged with glass wool, and the tube heated with a fish tail burner before the aspiration of air is started.

Evaporate to about twenty-five c. c., add twenty c. c. concentrated nitric acid, evaporate until a film begins to form, add thirty c. c. of nitric acid (sp. gr. 1.20) and again evaporate until a film begins to form. Dilute to about 150 c. c. with hot water and allow it to cool. When the solution is between 70 degrees and 80 degrees C. add fifty c. c. of molybdate solution. Agitate the solution a few minutes, then filter on a tared Gooch crucible having a paper disc at the bottom. Wash three times with a three per cent. nitrate acid solution and twice with alcohol. Dry at 100 degrees to 105 degrees C. to constant weight. The weight multiplied by 0.0163 equals the per cent. of phosphorous in a one gram sample.

Briquetting of Fuels in British Columbia—Description of Pacific Coal Company's Plant at Bankhead, Alberta.

By G. J. Mashek.

(Written for the "Canadian Mining Journal.")

The briquetting of coal dust and refuse from coal mines and breakers has not made much progress in North America, especially Canada, the reason being that very good quality of natural coal is still obtainable on the North American continent at a reasonable price, and also owing to the fact, that most of the briquetting experiments in years gone by have been done with European machinery, which has reached such a state of perfection in Eurpose that the briquetting of European coals has been a successful commercial undertaking.

Many attempts have been made to briquette American coals with European machinery, but in all cases it has been a failure, principally owing to the fact, that this machinery has a small output; its first cost is high, and it requires a large amount of labor to operate it. Briquetting machinery to fill the requirements in this country must be practically automatic and must make a better and a more suitable size briquette than it is possible to produce with almost any European machinery. Its cost of operation and up-keep must also be low, and it must produce briquettes of suitable size. This is principally owing to the fact that briquettes in this country must compete against better natural coal than in Europe.

Briquetting of the breaker refuse and dust is only advisable on coals that are non-coking or have very slight coking qualities. Dust from coking coals can always be turned into coke at a lower cost than into briquettes.

With the increasing cost of production of prepared coal due to increasing wages, transportation and handling, and increasing population, the time when briquetting refuse coal mines in North America, especially in certain portions of British America, is a profitable undertaking has arrived.

The following is a description of a double unit briquetting plant put in by the Pacific Coal Company, at Bankhead, Alberta, to briquette the fines of Western anthracite coal, of which there are large deposits in the neighborhood of Bankhead. This coal is a free burning, fairly hard coal; but quite friable. In putting it through the breaker and preparing it for the market there is produced as much as 30 per cent. of fines below pea size, which was practically unmarketable, especially in view of the long railroad hauls to point of consumption. It was for this reason that a briquetting plant was installed after a long investigation into the subject by the officers and engineers of the company, both here and in Europe.

Figure 1, shows a general outline plan of the briquetting plant together with its location in regard to the breaker. This breaker was installed and operated sometime before the briquetting plant was built. Description of the general operation of the plant is as follows:—

The coal from the mines is elevated to the top of the breaker, where it is cracked and screened with the sizes distributed to the proper bins. The dust falls into bins, beneath which is placed the dust scraper conveyor as shown. This conveys the dust from the breaker travelling over the trestle to the dust bin of the briquetting plant.

In the bottom of the briquette plant dust bin there are two drag conveyors which feed out the dust to two 36 x 16 crushing rolls. After a thorough examination and tests have been made of the character of this coal, standard mineral crushing rolls were decided to be the best pulverizers or crushers. While a large portion of the dust brought from the breaker will pass through fine enough mesh of screen for briquetting purposes there still will be pieces of coal probably running up to 1-2 inch size which have to be pulverized in order to avoid their being crushed in the briquetting press and producing defective briquettes.

In briquetting any fuel it is essential that the material be reduced to the proper and uniform mesh in order to make a hard briquette. Some coals can be briquetted considerably coarser than others. The best results obtained with this particular coal is that all of it should pass through a 12 mesh screen.

The drag conveyor referred to above is operated by means of a variable speed counter-shaft so that the feed can be easily regulated. From the crushing rolls the

FIGURE 1.

material drops to an elevator which elevates it to mixer No. 1 standing 10 feet above the ground.

This plant is a double unit plant run by two separate engines using only one hot melted pitch tank for feeding the mixers. There are six mixers to each unit. They are all practically alike with the exception of a slight difference in pitch and shape of the blades in the different mixers. These mixers were first designed to use fuel oil for heating, allowing the products of combustion to pass through the coal; but it was found, before this plant was contracted for, that the cost of fuel oil would be about 14 cents per gallon in Alberta. Therefore a coal burning furnace was installed instead.

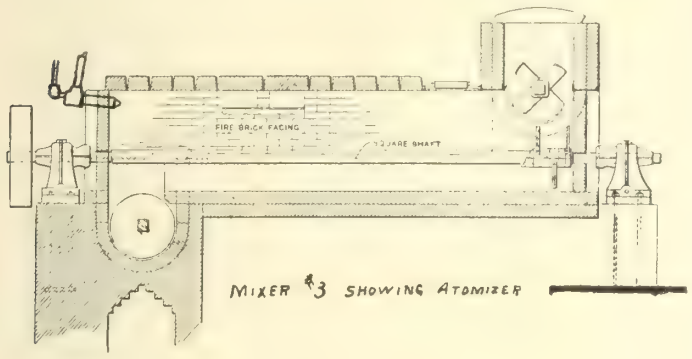

FIGURE 2.

It might be further said that these mixers are similar to concrete mixers. They are run at such a speed as to practically keep all the coal in suspension above the centre of the shaft of the mixer, and by passing the products of combustion directly in through the coal dust, the most efficient arrangements of imparting heat to coal are obtained. On account of the low specific heat of coal this step is necessary.

Mixers Nos. 1, 2 and 3, are used principally for drying and heating the dust, which must be brought up to a temperature of about 300 degrees F. At the lower end of mixer No. 3, the pitch is introduced. A section of Mixer No. 3 is shown in Fig. 2. With some change in the style and shape of the hardened steel blades, the other mixers are similar to this.

The pitch is delivered to this mixer by means of an atomizer as shown in Fig. 3. The object is to atomize the pitch into a vapour as it were, and have this vapour pass through the suspended material as it is kicked up by the mixer shaft with its blades, thereby coating each particle of the coal evenly.

If this theory had been correct there would have been no need of any additional mixers, as the coal would certainly then be in proper condition for briquetting. Early experiment with this apparatus brought out the fact that additional mixers are required after the pitch is introduced in order to make a thorough mixture, and one after another was added, until six mixers were placed in series. It was found advisable in plants erected in the United States to put in a type of pug mill blades in mixer No. 5, so as to break and spread out the balls formed by the pitch rolling in the dust.

Mixer No. 6 is only used for cooling the mixture, as it would be too hot to put in the briquetting press and make hard briquettes. In this mixer it is advisable to introduce a little hot water as the briquettes are in better shape when the mixture is slightly damp.

In order to make a good hard briquette of any coal it is absolutely necessary that the surface of the particles of coal dust be dry so as to allow the pitch to properly adhere to it. It may appear, if pitch is introduced into wet coal dust, that there is an adhesion, but it is so small that it makes briquettes weak and liable to disintegration in handling and during combustion, owing to steam being generated in the briquette.

It has been found by experience that if there are a sufficient number of mixers and the material is brought up to the proper temperature it is immaterial whether the pitch is atomized or just pumped in straight through a distributing pipe. In fact, in a plant running at a rate of about 12 tons per hour, the stream of steam from the atomizer enters the mixer with such force and in such

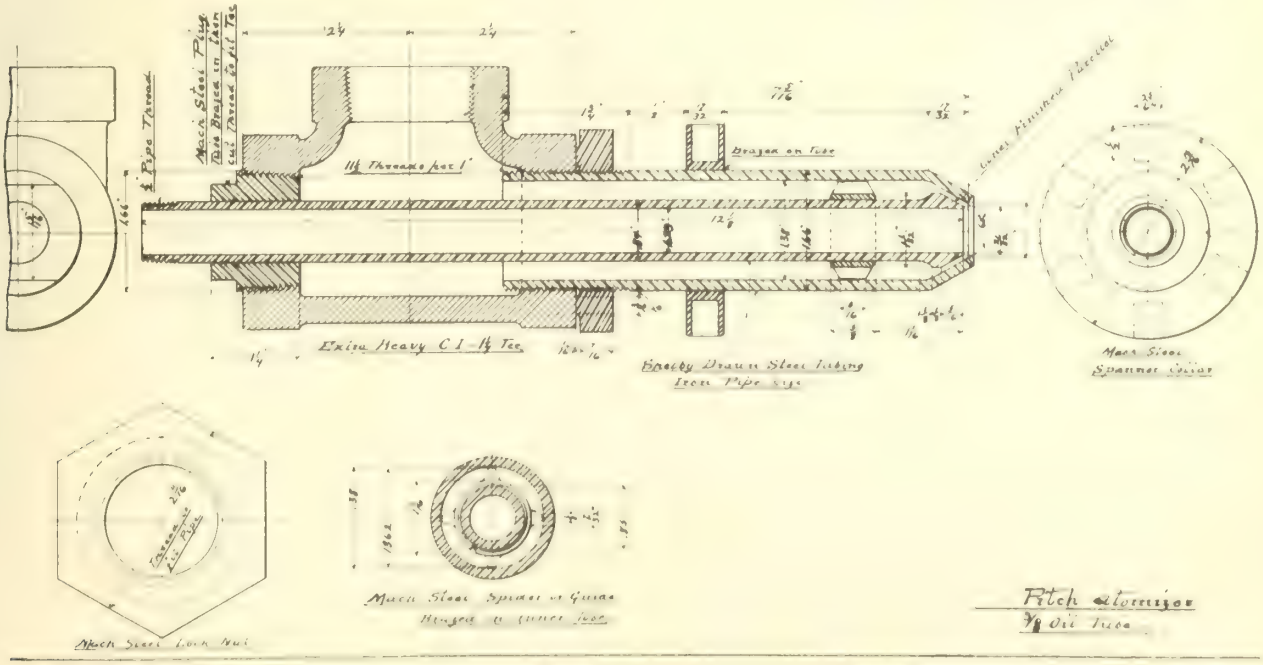

FIGURE 3.

volume that it has a tendency to blow back the coal dust and pile it up in a solid mass in the chamber, the mixer blades screwing it forward to the following one so that the need of atomizing in that case is entirely eliminated.

From No. 6 mixer the material drops into a continuous bucket elevator and is elevated to the top of the press hopper. This hopper has a capacity of about a half ton of mixture, and the material rests directly on the press rolls. The press is a modification of the Belgian type with the exception that it is made considerably stronger. All parts under strain are of steel. The gearing is made of cast steel with manganese bronze pinions, all having cut teeth.

(To be continued)

EXCHANGES.

Economic Geology, October-November, 1907.—An article of great interest in this number of *Economic Geology* is "The Weathering of Coal," by S. W. Parr and N. D. Hamilton. The writers conducted a series of experiments on small lots of nut, slack, broken lump and washed pea coal. The quantities used ranged from 10 to 20 pounds. It is pointed out that in storage plants with capacities of, say, 50,000 tons, deterioration of one per cent. means a loss of 500 tons. Also it is noted that deterioration would naturally occur at a higher rate in the small experimental lots than in commercial storage quantities.

The first series of tests was made as soon as possible after the mining of the coal. Here the writers lay great stress upon the prompt examination of samples to determine and record initial conditions.

The coal used was of small lump or nut size. Samples of one hundred pounds were subdivided in order to subject the same kind of coal to various conditions, as follows:—

(a) Outdoor exposure.

(b) Exposure to a dry atmosphere at a somewhat elevated temperature, ranging between 85 degrees and 120 degrees Fahr.

(c) Under the same conditions as (b), but to be drenched with water two or three times per week.

(d) Submerged in ordinary water at a temperature of approximately 70 degrees.

The conditions were continued through ten months. The results obtained are summarized thus:—

(a) Submerged coal does not lose appreciably in heat value.

(b) Outdoor exposure results in a loss of heating value varying from 2 to 10 per cent.

(c) Dry storage has no advantage over storage in the open except with high sulphur coals, where the disintegrating effect of sulphur in the process of oxidation facilitates the escape of hydrocarbons or the oxidation of the same.

(d) In most cases the losses in storage appear to be practically complete at the end of five months. From the seventh to the ninth month the loss is inappreciable.

(e) The results obtained conform in a general way to the experience of users of coal from large storage heaps.

The *Mining and Scientific Press,* December 28th.—This number contains an article on "Cobalt," by Mr. Frank C. Loring, of Toronto. Referring to value of shipments, etc., Mr. Loring writes as follows: "During 1907, up to October 1st, 10,300 tons of ore have been sold, for which possibly $6,000,000 has been received, almost entirely for silver. The district is now shipping approximately 1,000,000 ounces silver per month, as well as large quantities of cobalt, for which little is paid . . . Transportation and treatment charges are from $15 to $25 per ton, with deductions of 6 to 7 per cent. of the assay value of the silver. One smelter pays $20 per ton for ore carrying 8 per cent. cobalt. If ore is sold solely for cobalt 35 to 50 cents is paid per pound of cobalt, according to the percentage, with no allowance for silver."

The *Engineering Magazine,* January, 1908.—"Mining Developments in Nevada," by A. Selwyn Brown, appears in the *Engineering Magazine* for January, 1908. The article is a review of physical, not financial, conditions in Nevada mining regions up to the end of the year 1907. Up until 1900 Nevada had been looked upon as purely a silver producing State. The flooding of the Comstock mines in the early eighties and the closing of other silver mines had sadly depressed the whole industry. The Tonopah gold mine, discovered in 1900 in a remote corner of Southeastern Nevada, was purchased in 1902 by Philadelphia capitalists. Throughout the period 1904-7 a steady rush of prospectors set in. In 1905 Goldfield, Bullfrog and Manhattan camps were the centres of investment and financial activity. The present stringency has disorganzed the district badly. Mr. SelwynBrown, however, does not view the situation uncheerfully.

Many mountain ranges trending generally southwest, and having an elevation of about 500 feet, traverse the Tonopah and Goldfield districts. Artesian wells supply water to the large milling and cyanide plants.

Geographically, volcanic action has played a large part in the structure of Nevada. The volcanic rhyolites, andesites and porphyries are most important to the miner. Lead and copper lodes, however, occur in limestones and other sedimentary rocks. The whole of Nevada is mineralized, and many different minerals are mined. Government and companies' returns do not correspond, but the following total is the result of careful compilation. The total gold and silver production of Nevada from 1850 to 1907 is $1,033,350,000. The Goldfield mines this year from January 1st to November 23rd have shipped 112,081 tons of ore, valued at $11,208,100. Tonopah mines, worked in a more conservative manner, have yielded about $10,000,000. Other fields are credited with $4,000,000. The total for Nevada silver and gold for the year will be about $26,700,000. In nearly all Nevada ores the ratio of silver to gold is about two to one.

TONOPAH.

The Tonopah mining district is comprised in an area of about seven miles square: the whole of which is mineralized. It is probable that future work will show that the vein systems successfully worked on Lone Mountain, 17 miles west of Tonopah, and at Ray, 12 miles north of Tonopah, are extensions of the Tonopah systems. On the six first discovered mines, the Tonopah, Montana,

Midway, Belmont, North Star, and Tonopah Extension, the principal development work has been done.

There are six formations overlying the lower ore-bearing formations. As shafts have to be sunk several thousand feet before cross-cutting for a vein, scientific acumen and business sagacity are called into play.

The Tonopah mine, in which the first discovery of mineral was made (May, 1900), was also the first successful mine. The vein outcropped for a short distance on the surface and was sufficiently rich to bear all expenses of shipping to smelters in California and Utah. The mine is now 1,000 feet deep. The lateral developments exceed five miles in length. Ore blocked out for stoping is valued at $20,000,000. A milling plant within 12 miles treats 2,000 tons of this ore weekly.

On the Montana mine, where gold was next discovered, the vein is covered by several hundred feet of rhyolite. The shaft was located and sunk at a point accurately calculated to be on the line of strike of the vein eastward. The Montana ships 1,000 tons of ore weekly.

There are numerous other mines hardly developed to the producing point. Several are shipping, but in less quantities than the Montana.

The Tonopah is not a poor man's field. The ore-bearing andesite formations are covered by several hundred feet of rhyolite and other volcanic rocks, and shaft sinking is expensive. The veins are large, regular and uniformly rich at depth. Electric power is obtainable from the generating stations utilizing the hydraulic power of streams in the Sierra Nevada. A number of important mining centres are being developed near Tonopah.

GOLDFIELD.

Gold was accidentally discovered at a watering place in the desert 20 miles south of Tonopah in 1903. In 1905 gold to the value of $3,500,000 was obtained from nine of the principal mines. Last year the production was $10,000,000, and this year it is estimated at 127,000 tons of ore, valued at $12,700,000. More than eighty important mines are in course of development. Many of the mines have been handled by lessees. Speculation in stocks has been most pronounced. Stock sales during 1907 totalled $25,162,567.

BULLFROG.

Bullfrog goldfield is situated eighty miles directly southwest of Tonopah. Several important mines have been delevoped. Topographically it is similar to Tonopah and Goldfield.

The Western, Northern and Eastern fields are all active.

Nevada promises to become the leading gold-producing State before long.

The *Mining Journal* (London), December 21st, 1907.—Reviewing a St. Petersburg despatch, the *Mining Journal* takes up the question of exploiting Russia as a market for mining machinery and supplies. As a result of mining engineers resident in or visiting Russia the *Mining Journal* comes to the conclusion that if Russian conditions and idiosyncracies are carefully studied and responsible agents appointed who shall have an absolutely free hand, then the chances are excellent. A hint is given that the matter of "tips" must not be overlooked. The market for gold mining machinery in Russia is free. The highly primitive conditions under which gold is mined in Russia and the favorable light in which British manufacturers are regarded are indicative of a rapid extension of trade.

The *Chemical Engineer*, December, 1907.—A short article in this number outlines a process for making Portland cement from materials high in magnesia. Magnesia has heretofore been regarded as having a most deleterious effect upon cement. The possibility of using limestones high in magnesia will bring vast new fields into commercial prominence.

The process, for which a patent has been granted to Richard K. Meade, of Nazareth, Pa., consists in mixing with "cement rock" sufficient high magnesian limestone to bring the lime and magnesia in the mixture up to the proper ratio to the silica, iron oxide, and alumina. The mixture is then ground, burned, and a small percentage, preferably from 1 to 10 per cent. by weight of calcium chloride is added to the clinker and the mixture ground to the requisite fineness. Calcium chloride should be added in the proportion of 2 to 8 of magnesia.

Gypsum or plaster of paris may be added, if necessary, to regulate the set. Calcium chloride, however, is better. The calcium chloride combines with the free magnesium oxide in the cement when the latter is mixed with water, and forms with it an oxychloride compound of great cementing properties. The resulting mixture of Portland cement and oxychloride cement has greater strength and binding properties than Portland cement itself.

Personal and General.

Mr. George H. Dickson, of the International Coal & Coke Company, Coleman, Alberta, is in Toronto.

Mr. H. M. I. Weir, C.E., recently of Cobalt, passed through Toronto on his way to his home in Brantford.

Mr. Milton L. Hersey, of Montreal, visited Toronto on the 8th inst. Mr. Hersey has left for London, England, where he has been retained to give expert chemical evidence in an important case.

INDUSTRIAL NOTES.

Hearing of the important changes that the B. Greening Wire Company, Limited, of Hamilton and Montreal, had made in their premises lately, we thought it would be of sufficient interest to publish a cut of these buildings as they appear to-day. Anyone who has seen these works within the last few years prior to last May will recognize that a vast improvement has been made; in fact that a portion of the works altered would not be recognized. These premises now occupy portions of three seperate blocks.

On the southwest corner of Queen and Peter streets the firm erected a new weaving mill 260 by 130 feet, and in order to get light to this large building they adopted the saw-toothed roof, making this one of the best factory buildings in Hamilton. Here are installed all the heavy looms from the Napier street weaving mill, together with several additions, amongst which are the additional screen cloth looms installed this year. It was the intention to remove the old screen cloth plant to this building, but the firm felt they could not afford the time so that will remain where it is until after next season's trade, when it is the intention to take the temporary end out of the new weaving mill and build on an addition sufficient to accommodate all of the weaving plant. As stated above, the firm has added many new looms of practically all types, so that they are now in a position

to meet any demands that may be made upon them for all grades of wire cloth for years to come.

The old weaving mill on Napier street is to be added to the wire mill, as the increase in the weaving plant will require so much more wire. The space between the old weaving mill and the wire will on Napier street has been built up and the cleaning room for the wire mill containing all modern improvements is installed here.

poses, car ventilators, etc. They make steel wire rope for passenger and freight elevators, derrick, and contractors' use, mining purposes and transmission of power, perforated sheet metals in brass, copper, steel and iron for grist mill machinery, burning purposes, grain cleaning machinery, etc. Cirmped steel wire bonding for concrete work. They issue catalogues for the different branches of their business.

The firm report business quite brisk, especially in special weaving, to which they are devoting much time, attention and enterprise in installing looms to weave cloth of all degrees of weight and fineness of mesh.

Besides manufacture of wire this firm makes all kinds of wire cloth from the heaviest used for such as locomotive stacks, refuse burners for saw mills, to fine wire cloth for flour mills, office window blinds, mining pur-

Some years ago the firm found that its shipments to the Eastern Provinces were becoming so great that it was almost impossible to supply the demand from the head office, so a branch was opened at 422 and 424 St. Paul street, Montreal, under the management of J. H. Hanson. Still the trade increased, so that two years ago it was found necessary to take in the premises adjoining to provide room for the stock.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

GLACE BAY.—At their meeting in New Glasgow, on the 27th December, the Grand Council of the P. W. A. decided to ask the Minister of Labor to appoint a Board of Conciliation and Investigation, under the Lemieux Act, in the matter of the new schedule of rates that the Dominion Coal Company have announced their intention of putting into effect. The application to the Minister of Labor was despatched on the 31st December accompanied by a statutory declaration by the Grand Master and Grand Secretary of the P. W. A., that failing the appointment of a Board, a strike will take place if the Coal Company persists in paying the revised rates. To-day, the 3rd January, the Coal Company have posted notices at all their mines giving the new rates for mining and the new price for workmen's coal, which become effective on Monday, the 6th January. The new schedule gives an increase to every class of workmen employed at the mines with the exception of the men working in pillars and the machine men in narrow work. This latter class is a particularly well paid one, as the leading work is usually given to good men. The new rate for pillars, although reduced, is still a good one, and there will not be any difficulty in getting men, because the pillar men will still be able to earn higher wages than his fellow in rooms. The Coal Company are making it very clear that they intend to stick to their original promise that the new schedule should involve no reduction in the aggregate wages, and the whole of the money gained by the company through the cut in the pillar rate and the increased price of workmen's coal is to be given back to other classes of men, namely day laborers, mechanics and loaders. Indeed the net result of the schedule will be an increased [illegible] for the mines as a whole. The Coal Company state very definitely that the pillar rate is one which they refuse to discuss. After careful investigation and consideration they have come to the

conclusion that it will be to the advantage of the rest of the workmen to reduce the pillar rate, and in this particular their policy is fixed. The increased price of house coal will be compensated for by the increases in the wages already referred to. No further developments are likely to occur until the matter has been considered by the Minister of Labor.

NEW BRUNSWICK.

ST. JOHN.—Those interested in the Minto coal mines—the richest of their kind in New Brunswick—have been favored with an exceptionally good year.

One difficulty, however, has been the scarcity of labor. Every available man has been employed and while the output has shown no very marked increase, it is larger than usual. The labor difficulty has been relieved to some extent by hard times in other places, and men are now more plentiful.

Each shaft has averaged from twelve to sixteen men during the past year, but the gangs could be increased to thirty-five or even forty, which would practically double the output, thus better enabling the operators to meet the demands, which at present they are unable to do.

Nine shafts have been in operation throughout the year, several of them having produced an average of some forty tons a day each.

A short time ago F. M. Tweedie succeeded in securing the John McDonald property and has completed a new shaft, which will be opened in the near future. G. H. King has also completed a new shaft, which will be opened up in a few days. The latter is on the Minto mine and addition of these two will make eleven shafte in operation and others will be added during the year.

When the price of coal advanced, last autumn, the operators gave a similar advance in wages to their employees. The men who formerly received from $1.50 to $2.50 per day are now averaging from $1.75 to $3.00 per day. At this point, it may be added that the high rate of wages, together with hard times have probably had their influence in bringing more laborers to the mines.

It is safe to say that the coal market was never better than at present. The run-of-mine brings $2.50 per ton f.o.b. mine, which the operators regard as very satisfactory returns. The I. C. R. has taken a large quantity of the coal, and there is a brisk and steady demand for it from other quarters, so that the operators are unable to fill their orders; but they hope, during the present year to increase their output. It is much easier to send out the coal now, than it was a year or two ago, as many important improvements have been made on the N. B. Coal and Railway line. Throughout the year the service has been satisfactory and the road is at present in excellent condition.

The village of Minto is progressing. The population is increasing and a number of new buildings have been erected. G. H. King has completed six new dwellings, the Northfield Coal Company, of which Hon. James Barnes is manager, have put up eight or ten cottages, and three more have been erected by the Welton brothers.

The Rothwell Coal Company, recently completed a new shaft, which produces twenty tons of coal per day. It has also put up four dwelling houses and a small general store.

Considerable interest has been aroused by a mineral development near the town of Woodstock. The existence of iron ore has been known for some time, and it was once successfully worked, but it remained for a number of Carleton county people, headed by High Sheriff William A. Hayward, to demonstrate the fact that across the river, is a bed of rich copper, carrying gold and other metals.

Under the name of the Cobba-Sexton Mining Company, the parties referred to have already expended several thousand dollars in developing their areas, and are much gratified with the assays submitted from various places.

A number of others have taken adjacent holdings. The first gold found in New Brunswick was taken from these mines..

The five granite concerns at St. George, viz., Tayte, Meating & Company, the Utopia Granite Company, O'Brien & Baldwin, Epps, Dodds & Company and the Bay of Fundy Granite Company, who manufacture red, grey and black granite for building and monumental purposes, have had an exceptionally prosperous year. The introduction of modern pneumatic and other up-to-date machinery has tended to lessen the cost of production and rough hand labor, and the manufacturers are thus in a better position to compete for work than in the past.

ONTARIO.

COBALT.

Nipissing.—Mr. Drummond, the manager of the Nipissing mine, is leaving Cobalt for Salt Lake City, where he will be located permanently. He will be succeeded in the management of the mine by Mr. Parks, his present assistant.

On December 16th, the Board of Directors of the Nipissing Mines, Limited, declared a quarterly dividend of three per cent., payable January 21st, 1908, to shareholders of record of December 27th, 1907. Transfer books closed on December 27th and remain closed until January 22nd, 1908.

King Edward.—Mr. McCaskill, the manager of the King Edward mine, has taken over the management of the Colonial as well. Mr. Coombs, the manager of the latter mine, has gone to New York.

Cobalt Majestic.—The recently organized Cobalt Majestic Silver Mining Company, has taken over all the property of the Abitibi & Cobalt Mines Company, which consists of 320 acres. They have also acquired control of the Empress Cobalt, and have purchased a claim in the Township of James.

O'Brien.—On January 7th, a three inch vien of native silver and argentite, carrying high values, was struck at the 100 foot level, in the East drift from the main shaft. This is a continuation of the main vein.

Temiskaming.—A new, very rich, but narrow, vien has been struck at the 200-foot level. This is thought to be the extension of the big vein.

Mr. Floyd Harman, the superintendant, has resigned.

Silver Leaf.—The shaft on what is known as the "New Vein" on the property, is now down 55 feet. The values are very better than at the surface. There are 5 pay streaks of from 2 to 6 inches in width of high grade ore.

A second car of ore is now ready for shipment, about 12 tons being No. 1 and the balance No. 2.

Returns have not yet been received from the car shipped in December.

Buffalo.—In illustration of the values in some of the rich Cobalt veins, a vien two inches wide, in the Buffalo mine, is yielding about $300 per foot in the drift, 7 feet high. Figuring on two and one-half feet per day, two shifts would produce $750 worth of ore at a cost of about $12 per foot.

Anima Nipissing Lake.—The Rex Argentite Mining Company, organized by New York capitalists to operate in this section, have recently purchased through Capt. Jeffrey, late superintendent of La Rose mine, three 40 acre claims on the northeast arm of Lake Anima, Nipissing. A shaft has been sunk 30 feet on a vein which shows calcite, copper and iron on the surface. At 27 feet very good silver values were found. President Dougherty of the company, who inspected the property early in this month, has decided that the values discovered justify the installation of machinery and a plant will be brought in over the ice this winter. The property is situated about 9 miles west of Latchford.

In comparing the production of 1907 with 1906, there are many things to be taken into consideration. The strike caused a material reduction in shipments, and during the last 3 months of 1907 the drop in the price of silver and the difficulty in selling the ore has resulted in a curtailment of production and shipments. Mine managers are instructed to produce only sufficient ore to meet running expenses and pay dividends. Another factor in the reduction of tonnage is the fact that nearly all the large shippers are either concentrating their ore or have arranged to do so. This will naturally result in a great reduction in tonnage and a corresponding increase in value shipped. There are now six concentrating plants in the camp, either in operation, or well on the road to completion. Two of them are customs concentrators, which will handle the output of the mines not equipped with plants of their own. The total shipments from Cobalt in 1907, were 14,040 tons. La Rose mine heads the list with 2,853 tons, the Coniagas next with 2,399 tons and the Nipissing third with 2,394 tons. There were 25 shippers on the list in 1907, out of which 18 or 19 may be properly classified as shipping mines, which can be counted on as factors in the production of 1908. There are also a number of properties that have good prospects of becoming shippers, and at a conservative estimate there will be at least 25 or 30 shipping mines by 1908.

In 1904 Cobalt produced 158 tons, valued at $136,217; in 1905 Colbalt produced 2,144 tons, valued at $1,473,196; in 1906 Cobalt produced 5,129 tons, valued at $3,900,000.

The shipments for each mine in 1907, are as follows:—

	Ore in lbs.
Buffalo	2,208,820
City of Cobalt	101,280
Coniagas	4,798,710
Cobalt Central	101,360
Colonial	74,250
Drummond	108,920
Foster	611,803
Green Meehan	196,780
Hudson Bay	243,170
Imperial Cobalt	37,530
Kerr Lake	644,800
King Edward (Watts)	62,250
La Rose	5,706,875
Mckinley-Darragh	1,407,935
Nova Scotia	493,000
Nipissing	1,407,935
O'Brien	2,666,360
Red Rock	91,443
Right of Way	258,220
Silver leaf	93,618
Silver Queen	957,157
Trethewey	1,710,438
Townsite	234,278
Temiskaming	430,611
University	61,383

Estimated value, $5,650,000.

ALBERTA.

COLEMAN.—All the mines along the Crow's Nest Pass have been idle for the Christmas and New Year's holidays. Although large numbers of men were to be seen in the various camps, things were very quiet. Some of the mines complain that the men are inclined to take a few days longer than the regular holiday, but on the whole the men have reported for work fairly well. The Lille mine, near Frank has not resumed work since the holidays, and the Frank mine of the Canadian-American Coal & Coke Company is also shut down. There is a rumor that trade is dull, but up to the present the real reasons for the shut-down have not been officially announced.

TABER.—The three Boards of Conciliation held in connection with the labor troubles, at the Canada West Coal & Coke Company, the Duggan & Huntrods Company and the Domestic Coal Company, all of Taber, have reported to the Department of Labor, Ottawa.

Judge Stewart, of Calgary, was chairman of all three boards, and the main question at issue were the same in each case. About 250 men were affected. All the points in dispute have been amicably settled between the three companies and the United Mine Workers of America. The companies concede express recognition of the union and accept the check-off system, whereby the union dues are deducted from the workmen's wages and paid over to the union officials. There will be no change in the hours of labor and the companies will pay monthly by cheque.

There is now more trouble brewing at Taber between the Marsh mines and their employees. The men have given notice to terminate their agreement with the company and have asked an increase in wages.

So far no application has been made to have the matter arbitrated under the Lemieux Act, but it is stated that the company intend to apply to the Minister of Labor to have an Arbitration Board convened.

STRATHCONA.—As a result of the Conciliation Board meeting under the Lemieux Act to enquire into the dispute between the Strathcona Coal Company and their employees, the questions in dispute have been amicably settled. The miners will receive an 8-hour day and an increase of wages. The miners who are on contract work and are paid by the car, will now receive renumeration at the rate of about $1.00 per ton for the coal they dig. The Board was composed of T. L. Otter, coal merchant, representing the operators, F. H. Sherman, president of the United Mine Workers, of America, representing the men and G. S. Montgomery, chairman.

EDMONTON.—General Manager M. H. McLeod, of the Canadian Northern Railway, states that there is no shortage of coal in the towns along the line east of Edmonton this winter. The Canadian Northern Railway Company are conducting experiments with a special design of smoke-stack for the use of lignite coal on their locomotives. At present this coal is forbidden by the Railway Commission to be used during the summer months.

These new smoke-stacks are designed with a view to spark prevention, as the lignite coal when burned in a locomotive firebox gives off a great number of sparks, thus constituting a danger of prairie fire on some sections of the line.

It is expected that the Grand Trunk Pacific will have their line to Edmonton in operation next fall, but as this railway will be pushed right on the mountains it is not likely that they will use much of the lignite and semi-bituminous coal from the Edmonton field. As soon as the line is completed to the mountains, they will be in a position to obtain a good supply of high grade steam coal.

It is stated that bituminous coal fields of great extent have been discovered on Bear River, in Northern Cariboo, B.C. These are on the main line of the G.T.P. and are 100 miles north of Barkerville. Twenty claims of 640 acres each have been staked by Joseph Wandle and B. A. Lascelle.

This new coal field may yet prove to be of as much importance as the great Crow's Nest Pass coal field. There is also large coal deposits in the Yellow Head Pass, through which the Grand Trunk line runs when it leaves the prairie country.

CALGARY.—At a public meeting in Calgary the Hon. W. H. Cushing, Minister of Public Works, for the Province of Alberta, stated that in the session of the legislature, which opens in a few weeks time, measures providing for a legal working day of eight hours in coal mines, the payment of indemnities to miners injured in coal mine accidents or, in the event of death, compensation to their dependents, will be introduced. Mr. Cushing said:—

"The coal operators have already granted an eight-hour day to their employees. The effect of the proposed bill will be to give this arrangement legal status. The principal measure will provide for the compulsory payment of indemnity to coal miners injured while pursuing their ordinary avocation. In the event of death the compensation will be paid to the nearest relative. The bill will be modelled on an enactment which has worked well in practice in England. Our Government takes the view that the injured or survivors should not be compelled to fight long drawn-out legal battles in the courts in order to secure damages."

The measure will be a compulsory one.

Continuing, Mr. Cushing said, "I do not anticipate a fuel famine in the new provinces this winter, although the coal reserves are not large. The weather is exceptionally mild and the remainder of the winter promises to be favorable. This is based on former experiences. Why, at this time last year we had experienced over two months of inclement weather. There has been some talk of a shortage of cars for hauling the coal from the mines, but I don't know what truth there is in these reports. Thus far we have not had any complaints."

GENERAL MINING NEWS

NOVA SCOTIA.

TORBROOK.—At the Annapolis mines, Torbrook, No. 1 shaft is producing two hundred tons of iron ore per day. No. 2 shaft, a new one sunk on a rich hematite vein, is producing sixty tons of ore per day from development work only. The water power is to be harnessed at Nictaux Falls next summer.

ONTARIO.

OTTAWA.—An order-in-council has been passed regarding the regulations governing the issue of leases to mine for coal within the Rocky Mountain park and substituting therefor new regulations. The duration of the leases is fixed at twenty years, but may be terminated by the consent of the Crown for non-fulfillment of conditions. The ground rent is fixed at one dollar per acre. It is provided that the lessee shall commence active mining within one year. In addition to rent, a royalty of five cents per ton will be collected, and default of payment, within thirty days shall be followed by the cancellation of the lease. The minimum leased to one person is 160 acres and the maximum 640 acres.

The Canadian branch of the Royal Mint was formeraly opened on the afternoon of January 2nd. The first silver half-dollar was struck off and presented to Earl Grey, the Governor-General. The first copper coin was presented to Countess Grey. A distinguished gathering took part in the ceremonies. The officials of the mint are: Dr. Bonar, deputy master; Mr. A. H. W. Cleaves, superintendent; Mr. J. A. Cleaves, assistant superintendent; Henry Ewart, assistant to the superintendent; Mr. A. Pearson, chief assayer; Mr. C. N. Entwhistle and Mr. William Groves, assistants; Mr. John Roe, chief clerk; Mr. P. S. Roe, chief of mechanical department. Visitors after January 13th will be shown through the mint by Mr. H. H. Seguin.

COBALT.—Inspector E. T. Corkill is investigating the recent fatalities due to dynamite explosions. The inquests in each case revealed carelessness on the part of the victims themselves.

It is reported that the last car of ore shipped from Trethewey will realize $40,000.

The Foster Mining Company has a car of high grade ore and the Watts mine has two cars of good ore ready to be shipped.

Referring to a paragraph appearing in the last number of the CANADIAN MINING JOURNAL regarding the sampling of the ground in dispute between La Rose Mining Company and the Right of Way Mining Company, the engineers who made the examination were all Canadians. The excellent work performed was done by Messrs. J. B. Tyrrell, R. W. Brock, A. A. Cole, W. Askwith and A. Wilson.

ALBERTA.

The work of reopening the Breckenridge & Lun Colliery, under lease to the Alberta Fuel Company, is making progress, and the daily tonnage is about 100, and this is to be increased steadily. The colliery is equipped with a plant costing $70,000, and the product is turned out in excellent shape.

The decision of the C.P.R. to permit its cars to run south of the international boundary when loaded with coal, will materially improve conditions in Alberta coal regions.

It means that during the next five months the Lundbreck collieries will be occupied in supplying fuel to the district and that the output will be larely increased. Heretofore the markets south of the border have been compelled to depend upon foreign cars in transit westward to be loaded with lumber and other products for eastern shipment. The new policy will enable the Alberta mines to fill orders for coal that have been piling up for two months.

The Galbraith Coal Company's new plant has enabled the colliery to fill many orders for the Canadian market, and the pressure from that part is materially relaxed, although orders for more than 100 cars are unfilled. It is expected that by the end of December the bulk of the orders in hand will be filled.

On the Alberta Coal & Coke Company's property, south of the Galbraith areas, another of the parallel seams extensively developed on Galbraith ground has been opened. The Alberta Company now has seams 14 and 15 feet in thickness respectively, and at an interval of 180 feet. The coal is indentical with that in the Galbraith seams—hard, clean and bright. The present openings are only 3,000 feet from the main line of the Crow's Nest Railroad, and it is planned to establish permanent workings at or near this point, which can be reached with a spur track having a slight gradient.

BRITISH COLUMBIA.

BARKERVILLE.—The gold yield of Cariboo for 1907, is expected to show an increase of about one-third over the 1906 yield. During the hydraulicking season this year there was a heavy downfall. This together with the working of three properties, unworked in 1906, will explain the better results. The three properties were the Lowhu Creek, Forrest Rose and Nugget Gulch hydraulics.

The Bear hydraulic, on Cunningham will probably wash 500,000 cubic yards during 1908, and the Russian Creek hydraulic will become a producer.

CRANBROOK.—Placer ground on Perry Creek has recently been purchased by the Illinois Steel Company. The reported price is $900,000 for nine-tenths, the former owners retaining one-tenth. A flume four-foot square in section conveys the water of Perry Creek a distance of four miles, whence it drops 600 feet at a sharp angle through cast-iron pipes. A pressure of 300 pounds is developed at the bottoms.

PHOENIX.—On December 28th there were from 75 to 100 men at work at the Granby mines. Applications have been received from possibly 250 others. According to Mr. O. B. Smith, the superintendent, full operations will be resumed in a few days.

as soon, that is, as the big 60-drill compressor is in running order. Shipments of ore were not expected to begin until after New Year's day.

The Venus mine in the White Horse district is said to have been bought by Mackenzie & Mann. It is a gold and silver property. The price reported is $60,000.

On Christmas eve it was announced that the Grand Forks Smeltermen's Union No. 180 and Phoenix Miners' Union No. 8 had definitely accepted the new wage scale and had arranged to resume work at the Granby smelter and mines. The result of several conferences between Mr. Hodges, local manager of the Granby Company and the representatives of the men, was that the vote for the new scale was declared unanimous. Referendum votes in Phoenix had resulted favorably, in Grand Forks unfavorably.

ROSSLAND.—The Trail smelter has just completed a shipment of 250,000 ounces of silver to the new Canadian Mint, at Ottawa. The Trail bar silver is 999 fine. This is beyond the most rigid requirements of the mint. The requirements of the mint will be about 1,000,000 ounces per annum. The Consolidated smelter can produce twice that amount.

VICTORIA.—In the absence of official reports the following notes on production are of interest.

The Wellington Colliery Company, on Vancouver Island, has produced about the same tonnage as during 1906, namely 800,000 tons of coal and 10,000 tons of coke. This year prices have been higher.

The Western Fuel Company, at Nanaimo, have probably an increased output over 1906 of 100,000 tons.

About 4,000 tons of lead (practically the amount produced in excess of Canadian requirements) has been exported in ore, principally to Europe.

The gold production of Atlin will be about the same as last year; that of Cariboo is less.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

A question has been raised as to the advantage of the hot blast in pyrite smelting. Since the invention of the hot blast in 1828 air has been supplied to iron smelting furnaces at a temperature varying from 570 degrees F. to 1,472 degrees F., with the result that the consumption of coke in the larger furnaces now used, has been reduced from about 8 tons per ton of iron produced to about 1 ton, 12 hundredweight. The undoubtedly beneficial results of the hot blast in iron smelting have led to its general adoption in other branches of metallurgy. In pyrite smelting it is generally regarded as necessary, but L. Parry, A.R.S.M., in a letter to the "London Mining Journal" adduces strong arguments against this view, contending that with the necessary skill as good running may be made with cold blast as with hot blast, even in partial pyrite smelting, and with probably better concentration. His views are supported by experience at Mount Lyell, Australia, where the hot blast has been abandoned.

It is stated that Messrs. Baldwins, Limited, of Stourport and South Wales, have secured a controlling interest in the Beaufort Tinplate Works, Morriston, comprising nine mills, which employ about 400 hands. They are among the best situated in the Swansea district.

At the Carn Brea Tin mines, Cornwall, the lode recently cut into at the 125-foot level, north of former workings and west of the cross course, indicates great possibilities, as the upper levels are developed in unexplored ground. Forty tons of stuff averaged 72 pounds of tin.

George McCulloch, formerly chairman of the Broken Hill Proprietary Company, died in London December 12th. The accidental discovery of this famous Australian mine in 1883, when Mr. McCulloch was manager of a sheep station, was the beginning of his mining career, in the course of which he acquired a large fortune. He devoted much of his wealth to the accummulation of a fine art gallery.

RUSSIA.

A Russian syndicate is boring for naphtha near Kertch in South Russia. Four holes are being put down, one having reached a depth of 100 metres and naphtha is expacted soon.

From the mines of the Magnesite Company in the Uphim Mountain district there were produced in 1906, 1,459,374 pounds of magnesite.

Attention is being drawn to the mineral wealth of Eastern Siberia, which abounds not only in iron deposits, but in timber and coal for fuel. There is magnetic ore at Myssoff, Baikal, and in the upper Lena district, uematite iron deposits near Iliksin with 60 per cent. metal, as well as 57 per cent. iron pyrites about 300 versts from Irkutsk by water, in addition to other deposits of value. The great want of Eastern Siberia, the population of which has increased very rapidly, is a metallurgical industry.

The Statistical Bureau of the Council of Mine Owners of Southern Russia recently published data covering the first six months of 1907, from which it appears that the yield of pig iron amounted to 51 million poods an increase of 3 million poods over the corresponding period of the previous year and the output of semi-manufactured iron to 40 million poods, an increase of 4 million. The increase is explained by the fact that the Russian mine owners have begun to export to foreign markets. The number of workmen in all metallurgical enterprises was 51,264 men in June last as compared with 41,152 in June 1906.

AUSTRIA-HUNGARY.

The Hungarian Government has decided to purchase a number of coal mines and has already acquired in the valley of Almas a coalfield 207 kilometres in area. In Croatia a mine producing 100,000 tons of coal and with a capacity for a much larger yield has been acquired and negociations for the purchase of an extensive coal deposit at Ormos in the Borsod district are in progress.

SPAIN.

A company is being organized in France to work the arsenic and gold mines of Carballino in the Province of Orense, the analysis of ore giving 40 per cent arsenic and 73 grammes of gold per ton. The ore will be shipped to Gonfreville, near Havre for treatment.

The law drafted by the Spanish Minister of Agriculture regarding mines, creates a commission of officials from the Finance Department, whose duty it will be to fix and publish yearly the value of minerals with a view to the tax of 3 per cent. The Government will also bring forward a scheme for the compulsory expropriation of mines.

UNITED STATES.

The Nome Mining Company, of Nome, Alaska, intends to begin next June to operate a dredge of the capacity of 5,000 cubic yards per day, the largest in that part of Alaska.

The Elmore vacuum process is being tested experimentally at the works of the Empire Zinc Company, Canyon City, Colo. An Elmore plant has been installed at the Marion mine, Usc, Colo., and the Union Copper Company is putting one in at its mine in

North Carolina. The process is likely to receive extensive trial in cases where it appears suited to the ore.

A large low grade vein has been discovered in the Montana Tonopah mine at Tonopah, Nevada, the 760-foot level. The ore-body is 30 feet in width and of milling grade. The discovery is regarded as likely to encourage other mine owners to make deep explorations.

The year 1906 witnessed a marked revival of the manganese industry. The output was 6,921 long tons, valued at $88,132; an increase of 2,803 tons in quantity and $51,918 in value over 1905.

More new mines were opened on the Mesabi iron range, Mich., last year than during any previous twelvemonth. The number added to the list was 21 making an approximate total of 120 on the range, of which, however, upwards of a score are not in operation. Seven of the new mines belong the U.S. Steel Corporation and four to the Republic Iron & Steel Company. Shipments of ore from the range during 1907 amounted approximately to 27,-260,000 tons.

The Old Town mine, one of the early large producers of Gilpin County, Colo., which is credited with a total yield of gold to the value of $1,787,000 above the 15th level, has been connected with the Newhouse Tunnel by a lateral of 4,300 feet and a shaft of 2,186 feet.

Mine owners of Pioche, Nev., cut wages on January 1st, the reductions in some cases amounting to 20 per cent.

SOUTH AFRICA.

Statistics issued by the Mines Department of the Transvaal give the value of the mineral output for October, exclusive of diamonds, as £2,439,513, made up as follows: Gold, £2,352,337; silver, £7,779; coal, £66,530; base metals, etc., £12,867. The total production for September was £2,375,338. The number of camps in operation on the Rand was 8,824, the same as the previous month. Three thousand Chinese had been repatriated during the month, their places being taken by colored labor. The number of employees was as follows:—Whites, 19,349; colored, 143,187; Chinese, 44,365.

The Witwatersrand Deep mine is adding 25 stamps to its present equipment, weighing 1,400 pounds each, which will increase its crushing capacity to about 450,000 tons per year. The New Kleinfontein Company will add 20 heavy stamps to its plant, the Ferreira Deep is erecting 40, and many other installations are in process or being arranged for, the total number of new stamps to be erected being 705.

What is regarded as one of the most important discoveries of copper in South Africa has been made in the Tete country, near the Zambesi. A mining concession 417 miles square has been secured by Messrs Lawley & Cleary. Native copper and ore carrying 30 per cent. copper have been found.

The gold output of Southern Rhodesia for October was 53,822 ounces. There were 1,107 stamps working and 132,078 tons were crushed.

A considerable amount of activity is being displayed by prospectors among the western reaches of the Orange River, towards Upington, Kermoes. A number of farms have been taken up for diamonds and copper.

AUSTRALASIA.

The gold output of New Zealand for November was 54,121 ounces, value £215,524, as against 41,375 ounces, value £161,161,-983 for November 1906.

In the neighborhood of Barn Bluff, Tasmania, three immense ore bodies from 200 to 600 feet wide have been found. A low estimate of one of them gave 3,700,000 tons of payable ore containing copper, gold and silver. In another the ore assayed up to 20 per cent copper, 17 ounces silver and 4 dwts. gold. There is abundance of water power and timber in the neighborhood.

The Australian gold output for the 11 months ending with November, amounted to 2,883,935 ounces being a decrease of 284,243 ounces as compared with the corresponding period of 1906.

A syndicate with a capital of £35,000 has been formed to work a large area on the sea beach near Byron Bay, New South Wales, by dredging for gold and other minerals. The black sands will be treated with the Grill patent gold-saving machine, which is stated to have been successfully tested in Victoria.

At the London mine, Parkes, N. W. S., 90 per cent. of the gold is being recovered by the direct cyanide process.

CONGO FREE STATE.

Prospecting has revealed the existence of copper deposits throughout a zone extending 200 miles east and west and 50 miles north and south in Katanga district. A limited amount of development has revealed some two million tons of copper ore. Most of the deposits can be exploited by open cuts. The ore averages 13 per cent, metallic copper. Deposits of tin ore extend along the Lualaba River, below the Nsilo Falls for 175 miles, and explorations indicate the possibility of extracting a considerable quantity. The main drawback is the lack of transportation facilities.

STATISTICS AND RETURNS.

Sydney Mines, N.S.—A review of the operations of the Nova Scotia Steel & Coal Company, Limited, for the year just closed, shows a considerable increase in the volume of iron and steel produced and finished at the company's furnaces and mills. While the quantity of coal and ore mined was slightly less than that of the previous year, in accordance with the programme arranged early in the year, the output in all other branches shows considerable gains over any former year in the history of the company. The value of the aggregate output is also considerably higher.

Coal mined and shipped exceeded	680,000 tons
Coke made	90,000 tons
Iron ore mined	355,000 tons
Limestone and dolomite quarried	63,000 tons
Pig iron made	58,500 tons
Steel ingots	70,000 tons
Steel billets rolled at cogging mill, New Glasgow	55,000 tons
Steel bars, sheets and forgings manufactured from New Glasgow	53,600 tons
Freight paid to the Intercolonial Railway, direct	264,500
Freight carried on the Sydney Mines Railway of the company	1,300,000 tons
Freight carried by steamers owned and chartered by the company	650,000 tons
Wages paid at Sydney Mines	$1,385,000
Wages paid at New Glasgow	504,000
Wages paid elsewhere	270,000

The figures given above show, in most departments, very important increase over the previous year. In pig iron, about 18 per cent.; in steel ingots, about 35 per cent.; in plats, bars, and forgings, about 25 per cent.; coke, limestone and other products show increases of 10 per cent. to 12 per cent.

The plant and entire equipment of the company is to-day in a better position to handle an increased volume of business than at any time in the past.

1907 was marked in its early days by rapid recovery from the temporary depression caused in the previous autum by the rupture of relations between the Steel Company and its near relative the Dominion Coal Company. An unusually boisterous winter retarded progres ssomewhat, but from March to December operations were vigorously pushed and a full force was kept constantly employed. The results will be best understood by studying the table

of production—the tonnage of raw materials converted into iron and steel.

	Ore in tons.
Iron ore mined	593,000
Limestone quarried	352,600
Coke produced	409,000
Pig iron produced	256,500
Steel ingots produced	270,600
Blooms produced	237,500
Billets produced	71,000
Rails produced	129,000
Rods produced	64,500
Sulphate ammonia	1,550
Tar	*4,378,000
Granulated slag	17,000

* Gallons.

The most important additions to the company's plant were two Bessemer conveyors, with their accessory appliances.

The growing demand for power necessitated an increase in the quantity and efficiency of steam supply. This was obtained by the installation of several Babcock & Wilcox water tube boilers, and a system of superheaters.

The Nova Scotia Steel & Coal Company's coal output for 1907 will be approximately 650,000 tons, from three collieries, the new pit opened at Point Aconi, which was opened in June, adding only about 1,000 tons to the company's output for the year. A spur of railway 2 1-2 miles in length connecting this mine with the company's main line, was completed about a month ago. The work of pumping out No. 2 (Lloyd's Cove) Colliery begun on November 17th, is making excellent progress, and the water is being lowered at the rate of 30 to 40 feet per day. This colliery will be ready to produce probably in March next. It was abandoned in November, 1904.

In September last an electrically operated endless haulage system was installed in No. 5 Colliery. The new system is the latest and most approved in use, and is the only one of its kind in Cape Breton. No. 3 Colliery, which is the company's largest producer, was on single shift during the year, and to this fact is due the comparatively slight difference in the company's total output as compared with 1906.

The steel plant made an excellent showing in 1907 as compared with 1906, every department showing a large increase. The output of pig iron reached 59,000 tons, an increase of 10,000 tons over last year. The steel production was about 71,000 tons, being 20,000 tons more than was made last year. The coke output was also largely in excess of last year's record.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ending January 3rd was 18,048 tons, a daily average of 3,609 tons.

The December output at the Nova Scotia Company's collieries totalled nearly 50,000 tons. The total amount of coal mined from the collieries during the twelve months just ended, was 638.065 tons, No. 3 Colliery being the biggest producer with an output of 296,466 tons; No. 1, with 256,161; No. 5, 82,310 tons, and No. 4. 3,128 tons.

A new blast furnace record was made at the works of the Dominion Iron & Steel Company on Thursday, 1,027 tons being the output for theday. This is about 25 tons better than the record announced a few days ago.

Cobalt ore statement for the week, December 28th, 1907 to January 4th, 1908:—

La Rose Mines, to New York, Jan. 1st, 1908, 48,190; La Rose Mines, to New York, Jan. 3rd, 1908, 56,720; total 105,910.

Townsite Mine, to Canadian Copper Company, Copper Cliff, Jan. 3rd, 1908, 45,100; Nipissing Mines, to New York, Jan. 4th, 1908, 54,410; total 204,420.

Cobalt ore statement for the week December 21st to 28th, 1907:—

King Edward Mine, to Willard P. Ward, New York, Dec. 23rd, 62,250; Trethewey Mine, to American Smelting & Refining Company, Perth Amboy, N.J., 62,000; total 124, 250.

NOVA SCOTIA RETURNS.

Estimated returns of mineral production for 1907:—

Coal	$13,876,000
Coke	1,925,000
Gold	265,000
Gypsum, limestone and other minerls	975,000
Stone and building materials	310,000
Pig iron	1,385,000
Steel	4,100,000
Steel rails, rods, etc.,	8,150,000

Coal.—An authority upon Nova Scotia coal mining, the Hon. Robert Drummond, predicts an increase of half a million tons in the production of 1908 over 1907. The slight decrease of the total tonnage for 1907 as compared with the previous year is attributable to scarcity of unskilled labor, to the tardy opening of the shipping season and to the strike at Springhill.

The estimated coal production by countries, is as follows:—

	1906 Tons.	1907 Tons.	
C. B. county	3,841,000	3,820,000	D.21,000
Piction county	593,000	642,000	I. 49,000
Cumberland county	509,000	420,000	D.89,000
Inverness county	227,000	280,000	I. 53,000
Total	5,170,000	5,162,000	D. 8,000

Gold.—Close estimates of the production of gold for Nova Scotia for the calendar year just closed, put the figure at 13,500 ounces produced from 62,000 tons of quartz. This represents an average of $4.14 for every ton crushed. To this total 24 mines contributed. Many of these mines, however, were not in continuous operation. The output is valued at $265,000.

MARKET NOTES.

Silver.—December 19th, 53; December 20th, 53; December 21st, 52 1-2; December 23rd, 52 3-4; December 24th, 52 3-4; December 26th, 52 3-4; December 27th, 52 1-2; December 28th, 52 1-2; December 30th, 52 3-4; December 31st, 53 1-2.

December 31st, sterling exchange, 4.825.

Copper.—The copper market is steadying, with a strong trend towards higher prices.

December 31st, New York.—Lake, 13 7-8 cents per lb.; electrolytic, 13 5-8; London, standard, £62 for spot.

Lead.—Prices moving up from low water mark. New York, 3.55 cents per lb.; London, £14 for spanish.

Tin.—Light transactions on firm market. New York. 27 1-4; London, £123 11s. for spot.

Quicksilver.—New York, $46 per 75 lb. flask.

Industrial Paragraphs.

Circular No. 1,097 of the Canadian Westinghouse Company, describes their types K and KG motors. These direct-current series wound motors are for use on cranes, hoisting machinery and similar service.

The Coniagas mine has installed two Deister concentrating tables. These are giving particularly good service. Large installations have lately been made in the Western States. Mr. C. B. Fitch, of Fort Wayne, handles the Canadian business.

MINERALS
And How They Occur

A Book for Secondary Schools and Prospectors

BY

WILLET G. MILLER

Provincial Geologist of Ontario; formerly Professor of Geology in the School of Mining, Queen's University, Kingston, Canada

252 pages; price $1.00; post paid. Boards

Dr. Miller's text-book, now in its third edition, has undoubtedly met the requirements of prospectors and students. It is simple in diction, and logical in plan. It comprises exactly the information needed by the beginner and, because of its clearness and simplicity, it is distinctly of value to all classes of mining men.

"Minerals and How They Occur" can be obtained from the Canadian Mining Journal

Make a Frame House Look Like Stone

By far the most durable, most sightly outside finish for any house—makes it warmer winters, cooler summers—weather-proofs it—helps make it fire-proof too—that's

PEDLAR ART STEEL SIDING

Hundreds of patterns, to suit any idea you have,—perfect imitation of brick, cut stone, rough stone, etc. Cost less than you'd think for such value. Send for the book about modern metal finish, for all kinds of structures. It's FREE. Address 212

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

J. A. JOHNSTON, SUDBURY.

Wanted

Position as Manager, Superintendent or Assistant. 20 years practical experience as Consulting Engineer, South Africa, United States and Mexico, in underground mining, gold, silver, copper and pyrites mines and milling. Specialty, production at minimum cost. Expert bookkeeper and mine accountant.

Address "M. T." Canadian Mining Journal

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory

Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions. The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assay can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

Dominion of Canada

Synopsis of Canadian North-West Mining Regulations

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

N.B.—Unauthorized publication of this advertisement will not be paid for.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper **$5.00**

CORLISS STRAIGHT LINE COMPRESSORS

FOR ECONOMICAL SERVICE

The Sullivan "Class WC" Corliss Tandem Compound Steam and Two Air Compressor, here shown, is designed to supply the demand for a compressor of the highest grade and of moderate capacity. This machine is furnished in sizes from 900 to 2500 cubic feet of free air per minute, and embodies the following advantages:

(1) It is equipped with full Corliss valve gear on both high and low pressure steam cylinders, which reduces its consumption of fuel to that of the best class of Corliss Cross Compound Compressors
(2) It is much lighter than a cross compound compressor, thus lowering the charges for transportation and foundations.
(3) It is more compact aud contains fewer working parts; hence, costs less for maintenance.
(4) Its mechanical efficiency places it in the first rank of air compressing machines, and it performs satisfactorily all the functions of a heavier, more complicated and more expensive compressor..

The Mining Manual
For 1908
By WALTER R. SKINNER

Contains all the latest information up to within a few days of publication. The Standard Reference Work on Mines. 1,600 pages. In demy 8vo, cloth. Price 21/-, post free.

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1908 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron and other mining companies of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905. Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

R. G. DRINNEN, Superintendent. C. C. S. LINDSEY, General Manager.

HUNTING TRIPS

THERE is no Railroad in America, probably in the world, that can bring Sportsmen within touch of so many famous haunts of big and small game as can the Canadian Pacific. From the lordly Moose of Nova Scotia and New Brunswick to the Bear and Mountain Goat of the Rockies is a far cry but it is C.P.R. all the way, traversing en route hundreds of miles of ideal hunting country.

MOOSE ~ BEAR ~ CARIBOU

SPLENDID SPORT along the North Shore, and in the Rocky Country, between Sudbury and Ft. William (on main line)

SPECIAL EXCURSION FOR HUNTERS during October and November at rate of Single Fare for Return Trip.

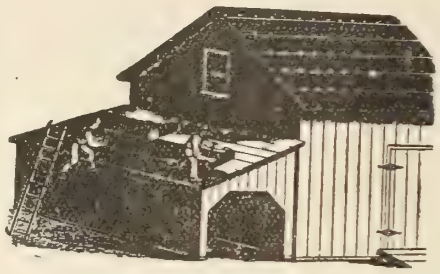
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

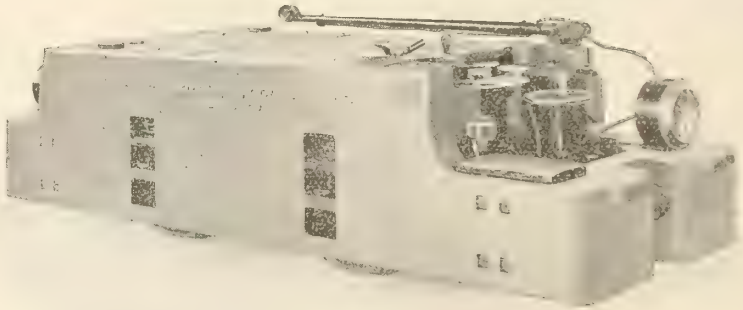
McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.



A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

ASSISTANCE TO PROSPECTORS.

Mr. J. B. Tyrrell, whose thoughtful articles we are always glad to publish, has recently made a practical and helpful suggestion. The railway companies every year grant special rates to sportsmen. Hundreds of townspeople, mostly the well-to-do, leave town during the fishing and hunting seasons. To these folk the railways offer special inducements. Reduced rates are given. Attractive folders, containing information regarding lake and river fishing, or describing the haunts of moose and deer, are widely distributed.

This policy is profitable to the railways and to those in search of recreation. But of infinitely greater profit to the country at large would it be were the railways to use similar means to encourage prospectors to explore the virgin fields of all our Provinces.

If specific geological and topographical data could be obtained from the railway offices, and if the inducements of cheap rates and special trains were held out, there is no doubt that many persons, now unable to afford the outlay, would spend their holidays not in the wanton destruction of animal life, but in searching for valuable minerals—an employment that cultivates mind and body alike.

A movement of this kind will meet with the warmest approval and co-operation of all mining men. The Canadian Mining Institute will be able and willing to contribute effective assistance.

This appears to us to be one practical method of encouraging the prospector. There are, no doubt, other means just as good. Therefore we shall be glad to receive letters from any of our readers who have given the subject thought.

EXPANDING MARKETS.

THE CANADIAN MINING JOURNAL is constantly receiving enquiries for ores of rare metals. Amongst the most urgent enquiries have been several from the United States for molybednum ores. An editorial note to this effect in a recent issue elicited many answers. A few of these answers were interesting. Most of them, however, were vague and meaningless. A large proportion of the properties referred to were totally undeveloped and of unknown value. Moreover, their owners were unwilling to spend money in ascertaining their extent and character, and were holding them with a view to effecting their sale at figures unreasonably large.

Instead of securing the opinion of a mining engineer who could advise concerning development and who could evaluate the property when developed, the owners prefer

to allow their claims to lie idle. This, however, by the way.

What we wish to indicate is that almost daily we receive enquiries for ores of tungsten, molybdenum, manganese, antimony, etc., etc. For the first two there is a very marked demand.

We shall, therefore, be glad to hear from owners of mineral properties who are either prepared to ship ore, or have prospected their areas sufficiently to know what they have.

SUMMARY REPORT OF THE GEOLOGICAL SURVEY—1907.

The despatch with which the Geological Survey of Canada has issued the summary of its labors during 1907 is creditable to all concerned. Its early appearance has set a pace that should be followed by Provincial Departments.

Unlike its predecessors, the summary for 1907 is a short, succinct resume. Formerly the annual summary reproduced a full account of the field work and investigations of the staff. The 1907 summary is a departure. It is an actual summary. It presents a concise outline of operations in the field and in the laboratory. Heretofore the summary has, in a sense, duplicated the various individual reports that were to appear later. Hence it was valuable to the general public, especially if the separate reports happened to be delayed, as was often the case.

Now, however, the case is different. The publication of a summary within a fortnight of the close of the old year, makes it incumbent upon the Survey to complete and issue the reports of its geologists and specialists at a very early date. Otherwise the public will be kept waiting for information that is of utmost importance.

In short, the Survey has set a pace not only for the Provinces, but for itself. This excellent summary will be meaningless unless the reports of each of last summer's geological parties is promptly forthcoming.

Meanwhile we congratulate the Minister of Mines on this new indication of efficiency.

A WESTERN BRANCH OF THE C.M.I.

On another page are given full particulars of the organization of a Western Branch of the Canadian Mining Institute at Nelson.

In the selection of its officers this offshoot of the present Institute has been particularly fortunate. Mr. A. B. W. Hodges is president, and Mr. E. Jacobs is secretary. Mr. Hodges is one of the outstanding figures in the mining circles of British Columbia. Mr. Jacobs, the able and fearless editor of the British Columbia *Mining Record*, is probably the best unofficial authority on Western mining affairs. Under his management the *Record* has proved itself a clean, reliable journal. Mr. Jacobs will undoubtedly perform the duties of his office with enthusiasm and discretion.

The remoteness of British Columbia mining centres from the East has made it impossible for many of the members residing in that Province to attend the annual meetings of the Institute. For this reason the Western Branch has been organized. Western members will now be able to meet for discussion of matters of moment whenever necessary. They will be enabled to deal promptly and weightedly with local issues and, at the same time, their support and advice will be of greater value to the parent institution.

LEAD BOUNTIES.

A petition, signed by practically all the owners and managers of silver-lead mines in East and West Kootenay, is about to be presented to the Dominion Government. The petitioners ask for an extension of the lead bounties.

Originally the Government appropriated $2,500,000 for the purpose of assisting the lead industry. This sum was to have been paid out in five annual payments of $500,000. The bounty period of five years expires in June of this year. So far, owing to restrictive conditions attached to bounty payments, only $600,000 has been paid out.

It is claimed with justice that the Dominion Government, having given a moribund industry a new lease of life, cannot now withdraw its aid. Additional force is lent to this argument by the consideration that only a fraction of the original appropriation has been expended. The lead producers are therefore approaching the Government with entire confidence that their reasonable request for an extension of the lead bounty will not be refused.

INSPIRED "NEWS."

An item has been going the rounds of the press and has unfortunately been reproduced in one or two technical journals, to the effect that a "corps of government engineers" employed by the "Dominion Government" had undertaken to solve the question of the depth and persistence of the silver deposits of the Cobalt districts. The item is untrue. Whatever basis some of the statements may have in fact is not a matter of public information. But the paragraph in question was written by an irresponsible person, who was either designedly misinformed or was himself untruthful. The question of the depth of Cobalt veins is working itself out every day. There is, however, no short cut to knowledge of this sort.

Neither the Ontario Government nor the Dominion Government has done any diamond drilling on the Gillies limit.

The Annual Meeting of the Geological Society of America, at Albuquerque, New Mexico.

Cyril W. Knight.

The Geological Society of America held its twentieth annual meeting in Albuquerque, the chief city of New Mexico, on December 30th and 31st, 1907. An informal session of the council was held in the Alvarado Hotel late in the evening of December 29th, on the arrival of the train from Chicago. The following two days were devoted to business and to the reading of papers, President Charles R. Van Hise being in the chair. A list of the papers is given below. The sessions were held in Hadley Science Hall, University of New Mexico, the president of which, William G. Tight, was untiring in his efforts to keep things running smoothly.

North America), mention is here made of the paper on the subject by President Charles R. Van Hise. He gave a splendid review of pre-Cambrian geology. In the spirited discussion that followed it was brought out that all agreed in the fundamental principles of classification, and that it was merely in the nomenclature that the dissenters found fault.

It was the expressed opinion of the society that the meeting was one of the most successful and instructive in its history.

During these two days most of us found time to visit what is known as the "old town" of Albuquerque, which

Members of the Geological Society of America, in the Sandia Mountains, near Albuquerque, New Mexico, between seven thousand five hundred and eight thousand feet above the sea.

The annual dinner of the society was held the evening of the 30th. It was over before ten o'clock, and was a source of keen enjoyment in its delightful informality, no toast list having been prepared. The following evening a reception and dance was given at the Commercial Club of Albuquerque and some of us had the pleasure of meeting and dancing with the most charming type of Southern girlhood.

There were fifty-one papers presented or read by title. No attempt will be made, therefore, to give synopses or go into the discussions. But in so much as Canadians are particularly interested in pre-Cambrian geology (Canada having the largest areas of these rocks in

has as yet escaped the dominating influences of American civilization. Here the easy-going, sun-loving Mexican lives in his adobe. The latter is built of sun baked clay bricks, to which some straw has been added. One building near the Roman Catholic Church was said to be two hundred and fifty years old. The church itself was one of those cool, dimly lighted buildings which must be extremely suggestive, to anyone with a spark of imagination or romanticism, of old time Mexican life. The few windows were high up and small and a soft, diffused, golden yellow light filtered through. It was cool, almost cold, compared to the warm clear air outside. As for the "soft voiced senoritas," to whom the railway

THE GRAND CANYON OF ARIZONA.

guide-book had referred with sublime and picturesque good faith, they failed utterly to materialize.

In one respect New Year's Eve was historical in Albuquerque. Gambling up to that night was not unlawful. We visited some of the gambling halls and saw the roulette wheel and other games in full swing. The places were crowded. But 12 o'clock New Year's Eve all these "joints" were compelled by law to close for the first time in hundreds of years.

New Year's Day was devoted wholly to a trip into the Sandia mountains (near Albuquerque), which rise over 10,000 feet above sea level. The excursion was made under the auspices of the Commercial Club of Albuquerque and the University of New Mexico. Four vans, each drawn by two teams of horses, left the city at seven in the morning. It was quite cold at that hour. After the first mile there is a gentle, gradual rise for ten miles until the foot of the mountains is reached. To one not used to desert country it was puzzling to note that on this gentle ascent the road seemed to be falling towards the mountain, but that always when we looked backwards it also fell away. It was merely one of those deceptive phenomena of the desert and mountain country. The ascent was continued until about one o'clock, through deep canyons and along winding aroyas, when an elevation of between seven thousand five hundred and eight thousand feet above sea level was reached. Here the party had lunch. Within a stone's throw the basal conglomerate of the Carboniferous was splendidly exposed, lying unconformably on quartzite and quartz schist of possibly pre-Cambrian age. The relationships of the pre-Cambrian rocks of the Sandia mountains have not been fully or satisfactorily worked out. We were keenly interested to find among them an old looking greenstone resembling the Keewatin series of Northern Ontario and the Lake Superior regions. This was intruded by granite. Besides the quartzite above mentioned there is a metamorphosed granite gneiss the relationship of which to the other three members was not clear.

After the sun was well up, even at this high altitude, it was warm and balmy. For the Eastern visitor the air was indescribably exhilarating. Here and there in the canyons we passed the adobe, and occasionally in the more open parts we met the solitary sheep-herder, with his herd all bunched together.

The return trip was made by a different route, giving us a chance to drink some natural carbonated mineral waters, and to see again the basal conglomerate of the Carboniferous, this time lying unconformably on the broken down surface of the metamorphosed granite gneiss above mentioned. We reached Albuquerque a little after dusk and the same evening took our sleeper for the West.

Before dawn the following morning (January 2nd) Adamana was reached. Our Pullman remained here for a day to allow a visit to the celebrated Petrified forest of Arizona. Most of the party got well loaded up with specimens of the fossil trees, the colors of which are very beautiful and the original structures well preserved.

We left in the evening for the Grand Canyon of Arizona, which was reached the following morning. For many of us this was the real point of interest on the trip. It would be puerile and uninteresting for a tyro to attempt a description of the canyon. All of us have read about it and will recall its total length of 217 miles. Its width for the fourteen miles we saw is 13 to 15 miles, and depth over a mile. The elevation of the rim is about 7,000 feet above the sea. To the reader these figures probably mean nothing, nor do they to the onlooker. It is only when one has gone down, down, down on the trail to the bottom of the gorge that he realizes to some extent its depth. For the lower 1,000 feet the Colorado river has cut its way through granites and gneisses for all the world like our vast Laurentian areas in Canada. As seen from Grand View Point the series appears to have been eroded down to a plane. What is known as the Grand Canyon group of sedimentary rocks rests unconformably on this floor. On the gently upturned edges of the canyon group rest, unconformably, Paleozoic beds, the majority of which are more or less horizontal. The Carboniferous is the surface rock. For those of us who had worked on pre-Cambrian geology in the thickly wooded, monotonous peneplane of Northern Ontario, where unconformities and relationships are with difficulty unravelled beneath their ubiquituous, glacial mantle, it was a source of delight to be able to see from the rim of the canyon such a profound succession of rocks.

But apart from geological considerations was the external beauty and grandeur of the chasm. Some of us were at the brink before daylight to watch the sunrise effects. No one will probably ever catch the coloring on canvas. One evening three of us had been quietly ab-

Mexican adobe in the "old town" of Albuquerque, New Mexico, showing in the left foreground. Dr. Ami, of the Canadian Geological Survey, on the right.

sorbing the scenery in front of the hotel, when four Western gentlemen issued from the door and walked to the side of the canyon. We had already experienced the different effects which a first glance produced, but it was rather startling to be brought back to earth by this expression: "By God, that's the deepest hole I ever see!" It was uttered with a nasal drawl and his earnestness was not lessened by the fact that he had dined not wisely but too well.

Some of the party made the trip down the Bright Angel trail on mules, while others, perhaps more energetic, preferred to walk. The distance to the bottom and back is about thirteen miles. A few of those who rode were novices on either horses or mules, and for them there were moments when thrilling was a tame word to apply.

Saturday evening, January 4th, the party broke up, the majority going home, but a few remained longer at the canyon before taking the train East.

The writer is not a member of the Geological Society of America, but it is with the permission of the secretary, Dr. Hovey, that this article is written.

Having lunch at the bottom of the Grand Canyon of Arizona, showing Colorado River.

CANADIAN MINING INSTITUTE—TWO IMPORTANT NOMINATIONS.

The ballots soon to be issued to the members of the Canadian Mining Institute will include two names to which THE CANADIAN MINING JOURNAL wishes to draw especial attention. Mr. H. E. T. Haultain has been nominated for the position of Secretary, and Mr. Milton L. Hersey for the position of Treasurer.

The Institute is fortunate in having names such as these on its nomination list. Both of the nominees are Canadians who have attained honorable prominence and success in their respective professions. Both are active members of the Canadian Mining Institute and of foreign scientific societies.

Mr. Haultain has been a true cosmopolite. His earlier education was received in Peterborough, Ont. Thence he entered the School of Practical Science, Toronto. After taking his degree from the University of Toronto, he took post-graduate mining work at Freiberg and London.

His early mining career began in Ireland and was continued in Bohemia, in which latter place he operated tin mines with success for a couple of years. His next move of importance brought him to Canada again, where in British Columbia he spent several years chiefly in the placer deposits of the Fraser River, controlling there the investment of considerable sums of money in pioneer work for the handling of auriferous sands by dredging and hydraulic methods.

From here about the year 1896 during the height of mining development in the Rand, South Africa, he was appointed from London, Eng., to take a prominent position in that mining field. Several years were spent here in various responsible positions at a number of the large mines, and he was finally retained by an English company, operating a gold property in Swaziland, where he designed and built a large stamp mill. About this time he unfortunately met with an accident which put an end to his career in South Africa, for the time being, and landed him in a London hospital for several months.

After this he returned to Canada where, with the exception of some time spent in the Western States, he has since remained engaged in a variety of mining under-

H. E. T. HAULTAIN.

takings. In British Columbia he developed and operated a number of gold mines, designing and erecting the entire plants. During the same period, and subsequently he acted as consulting engineer with the control of other important mines. While there he invented what is known

as the Haultain-Stovel Grease Process, for the separation of metals and sulphides from slimes. This latter occupied nearly two years of his time and on its perfection he was appointed to a special position by the corporation controlling many of the largest lead mines in the Western States, to investigate completely the efficiency of their milling plants.

Later he devoted his spare time to research work, especially in the mechanical and lixivation treatment of ores. He is admittedly one of the foremost authorities on this subject. One of his successes during this period was the invention of a new apparatus for electrolytic laboratory work, which has been adopted by a great many of the chemical laboratories attached to smelters and mining plants throughout the States.

In the summer of 1905 he was called from Arizona to take the position of manager of the Canada Corundum Company's mines at Craigmont, Renfrew County, Ontario, where he has brought to a successful issue what is probably the most difficult concentration problem that has yet had to be solved. In recognition of his work here he was, about a year ago, appointed general manager of all of the company's interests. His experience here for the past three years, controlling a force of from three to five hundred men under extremely difficult circumstances, has brought him prominently into touch with mining life and interests in Eastern Canada, a field where he was but little known before.

In the year 1900 he applied for and obtained with very high standing the degree of Civil Engineering, University of Toronto. Since then he has been elected to Asscoiate Membership in th Institute of Civil Engineering and Membership in the Institute of Mining and Metallurgy.

Mr. Haultain is a clear, forceful writer. His varied professional experience, his familiarity with mining methods in both the new and old world, and his deep acquaintance with technical literature, fit him peculiarly for the position to which he is nominated. As an executive officer and as editor of the publications of the Institute, his services will be of the highest rank.

The nominee for the position of Treasurer, Mr. Milton L. Hersey, of Montreal, is one of the foremost consulting chemists of the Continent.

Mr. Hersey, after graduating from McGill University, started in a modest way his present business of consulting chemist and assayer. A few years after obtaining his baccalaureate degree he applied for and obtained the degree of MSc.

For about twenty years Mr. Hersey has practised his profession in Montreal. To such an extent has his business grown that he now employs a staff of twelve or thirteen assistants in Montreal, most of whom are trained specialists.

Mr. Hersey's work has been of such immediate commercial importance that, recognizing the value of his expert advice, not only the City of Montreal and the Province of Quebec have officially retained his services; but many of the larger railway corporations and industrial concerns have engaged him either permanently or from year to year.

MILTON L. HERSEY.

The management of a large commercial laboratory, conducted on modern lines, has brought Mr. Hersey into contact with mining men from all parts of Canada and the United States. He is himself largely interested in the mining industry of Canada.

Mr. Hersey is young, vigorous and capable. As an official of the Canadian Mining Institute he will have the advantage of previous experience in other scientific societies.

THE CANADIAN MINING JOURNAL, as the official organ of the Canadian Mining Institute, and as the representative of the mining interests of Canada generally, endorses most heartily the two nominations mentioned above. We are confident that the election of both Mr. Haultain and Mr. Hersey will be for the good of the Canadian Mining Institute.

COPPER ORES OF THE SUDBURY-SOO DISTRICT.

J. C. GWILLIM.

Along the line of the C. P. R. westwards of Sudbury, and towards Sault Ste. Marie, there is a wide belt of Huronian rocks, the home of the Huronian rocks, if one may be safe in calling them by their time-honored name.

Throughout this belt of rocks westwards from Webbwood there is a type of copper-bearing vein, of which the Bruce Mines vein is a good example. At the Bruce Mines the vein is a nearly vertical quartz chalcopyrite vein in a fissure across a large area of diabase; in other places these veins are in fissures or along contacts of other rocks as well as diabase. They are usually nearly vertical, and they seldom carry much besides quartz, ankerite and chalcopyrite, and a little pyrites and specular iron sometimes in the more segregated or contact deposits. One is inclined to be surprised at the persistency with which these veins follow the general type over so large a district, and in such diverse rocks, diabase, quartzite, conglomerate and various highly metamorphosed ancient rocks.

The copper values, excepting superficially, are in the form of scattered chalcopyrite. The pay streak is not well defined or collected along either wall, or anywhere

else. Thus the rock is a milling rock, for the values in large tonnage rarely rise above 3 1-2 per cent. copper, with hardly a trace of gold or silver. Yet gold and silver veins do exist in their vicinity, as the Shakespeare mine near Webbwood and the Captive north of Bruce Mines and Rock lake testify, while silver is found with zinc and lead northwards from Garden River.

These bright quartz and yellow copper ores make very pretty displays in shop windows in various towns beside the great lakes, and have interested many people in their exploitation. Usually the mining rights belong to the farms who own the ground about these showings. Someone buys this right and the undeveloped prospect for a few hundred to five thousand dollars, shoots out a few sacks of ore and hires or uses a window for the display, calling for subscribers to put up money for development. In this way a few thousand dollars are raised, and work is begun.

The usual plan is to sink a vertical shaft at some point and do little prospecting or stripping elsewhere. The idea is to get down. After a time the funds run out, and since there is some trouble in realizing anything upon this class of ore, the work shuts down and the shaft fills with water.

Thus many hopeful prospects have now little to show but this timbered, water-filled shaft, and a dump which covers any adjacent surface showing. The natural inference is that if one pumped the water out one would only see the same thing as that which caused the development to cease, so that the ground is in a very unsatisfactory condition.

There is one strong point about these veins, they usually stay with one. There are few displacements or faults, and they have a considerable continuity both along the surface and in depth. Some of them, as Bruce Mines and Rock Lake, have produced quite heavily.

But Bruce Mines and Rock Lake, and every other producer, have met the same problem of a good saving by milling. The ores are not self-fluxing. They are far from it. They are low grade silicious copper ores, which look promising when copper is at a high price, especially to people who are wont to hear of the Michigan mines making money on ores of less than one per cent.; but these Georgian Bay ores are a totally different proposition, and they must be concentrated by some other method than by water to get a saving of over 60 per cent. or so. The copper pyrites floats as a yellow scum to a visible extent, and fine grinding is necessary to liberate the metallic particles.

Some experiments have been made with this ore by the vacuum oil process with exceedingly good results, both in the quartz-ankerite, copper-pyrites ore and the quartz copper pyrites ore. This process is not the same as the Elmore oil process. It uses less oil, so little that it is not thought worth recovering. Plants are operating in Cornwall and in South Africa; others are being put in at Golden and at St. Eugene mine, B.C., also one proposed for the Bruce Mines.

This process, together with a grouping of the best properties, may work out a reasonable return from these ore bodies, which in the aggregate may be depended upon to to furnish a large tonnage.

There is not much prospect of a steady development under the present conditions, for the smelter propositions await the development of ore supply, and the would-be miners await the smelters, so that they may realize upon their ore as they develop their mines.

It seems curious that this ore, so prevalent and in a way so unique throughout so wide a district southwest of Sudbury, is seldom met with in the northeasterly direction of the similar rocks towards Temagami and Temiskaming. There is, near Bear Island, on Lake Temagami, a property of Gibson and Dunlops' which is very similar in appearance, but usually copper showings do not follow the Bruce Mines type in form or contents.

In connection with this Sudbury-Soo district there is a lamentable absence of geological maps, or reports since the days of 1863 and Sir William Logan. Either the Provincial Bureau of Mines or the Dominion Geological Survey should investigate this portion of Ontario's great mineral-bearing strip.

ELECTROPLATING WITH CADMIUM.

The difficulties of electroplating with cadmium have been recently overcome, thus opening up an important use for the metal, which is now obtainable at a moderate price. The best results have been obtained from specially prepared cadmium carbonate, carefully purified, although the commercial salt has proven fairly satisfactory. The cadmium carbonate is dissolved in a solution of potassium cyanide, forming a clear, bright yellow plating bath, and a cadmium plate is used for the anode. A perfect deposit is had with either a hot or a cold both, a temperature of about 125 degrees F. being preferred. The coating, though soft, is harder than silver, and the color is as white as tin but not so white as silver. The surface, which takes a very high polish, is not readily tarnished by sulphuretted hydrogen or other vapors.

BRITISH COAL.

The *Iron and Coal Trades Review*, December 20th, points out that some years an accepted axiom of Great Britain's coal trade was that the price of coal must be kept low so as to stimulate business. The experience of 1906 and 1907 has changed this. Although coal deposits for foreign lands are being worked on an unprecedented scale, yet British coal is in bigger demand than ever before. The hold of British coals upon the market is illustrated by the fact that the Germany Coal Depot Company, organized expressly for the supply of German coal to German ships abroad, has for some time relied almost entirely upon British fuel for its requirements on the Mediterranean or on the Atlantic.

MINERAL RESOURCES OF THE UNITED STATES IN 1906.

The twenty-third annual volume of the series, "Mineral Resources of the United States," published by the United States Geological Survey, is now passing through the press. This volume contains a statement of the production of mineral substances in the United States during 1906.

Practically the same form of arrangement has been preserved in all of the twenty-two preceding volumes of the series, and it has become so familiar to the mining fraternity as to render any description unnecessary. But for those to whom this volume comes as a new book of reference it may be explained that the book is divided into chapters, each of which treats of a separate mining industry for the whole United States. The student who consults this report to find a combined statement of the

mineral resources of a given State is referred to the tabular statement of output by States in the summary and to the index, in which, under each State, is a list of the minerals produced therein. The effort is also made to show the conditions of the domestic industry in relation to foreign conditions in the same mineral industry.

It is important, also, for the new reader to know that this volume is simply the consolidation of the separate chapters after they have been published in pamphlet form, frequently months in advance, and that these pamphlet reports, and not the final volume, mark the dates at which the reviews become available. Further, for greater statistical promptness, it is the custom of the Survey to give the principal figures to the public press in advance of the publication of the chapters in pamphlet form.

Several new names appear in this volume for 1906 as the responsible authorities in charge of individual chapters. This is in pursuance of the policy of the Geological Survey announced in the volume for 1905 of assigning all subjects to members of the Survey staff who, in this work and in allied problems, are employed solely in the Government service.

The report on iron ores for 1906 was prepared by Mr. Edwin C. Eckel, who, in past years, has made a special study of the iron ores of the south. The series of iron ore reports for the United States owes its statistical development entirely to Mr. John Birkinbine, of Philadelphia. Under his direction the statistics of iron ore production have been developed to an exceptionally high degree of accuracy. This has been due, fundamentally, to the great confidence given him by iron ore producers, among whom Mr. Birkinbine has developed a spirit of fraternity similar to that which Mr. James M. Swank, the general manager of the American Iron & Steel Association, has evoked among the iron and steel manufacturers.

The reports on copper, lead and zinc in preceding years have likewise been developed entirely by Mr. Charles Kirchhoff, of the "Iron Age," New York. These reports have become classic for their statistical accuracy and for their keen and fair analysis of the trade situation. The report on copper for 1906 was made by Mr. L. C. Graton, and those on lead and zinc by Mr. J. M. Boutwell.

This volume also records the change of the administrative head of the division of Mining and Mineral Resources from Dr. David T. Day and Mr. Edward W. Parker, Dr. Day devoting his time to the important work of preparing the reports on petroleum and natural gas.

The change of administration includes the placing of the statistics of metal production (except iron ores) under the supervision of Mr. Waldemar Lindgren, who has, as chief assistants, Mr. Chas. G. Yale of San Francisco, Mr. Victor C. Heikes of Salt Lake City, Mr. Chester Naramore of Denver, and Messrs, Boutwell, Graton, McCaskey and Siebenthal, of Washington. This arrangement has materially strengthened the work of the division.

It is designed also to supplement the statistical data with the results of geological and chemical research in so far as they pertain to the economic development of our mineral resources. The Division of Mining and Mineral Resources has been for some time an integral part of the Geologic Branch of the Survey, this incorporation having been acomplished when the present plan of organization was adopted.

By way of brief review and summary of the series, it may be said that in the twenty-seven years covered by these twenty-three reports, the scope of the work has remained practically the same—an annual review of the mineral production of the United States and of the state of knowledge of the mineral deposits from which the products come. But the work involved has multiplied in two directions. In the beginning the statistical feature of the work was satisfied by an estimate as to the total output of each useful mineral. This estimate was based upon the best commercial estimate available, and the statistical correspondence was limited to a few hundred letters each year. When the control of the work passed into the hands of Dr. Day he took it with the intention of developing each statistical inquiry from an estimate into an accurate annual census through confidential reports at first hand, as rapidly as facilities would permit. This result has now been achieved with every industry except petroleum, and to this particular and difficult task he will henceforth limit his work. The correspondence necessary for this annual census of the mines of the United States has grown from a few hundred letters to an average of three written or printed communications a year to every known mine operator of the United States, more than one hundred and fifty thousand in all. In order to make such correspondence successful it has been necessary to send agents to the mines themselves, both for scrutiny of the statistical returns and in order to acquaint the operators with the nature of this inquiry and thus to secure the co-operation essential to success.

This growth of statistical work would have been necessary even if the mine development had remained stationary. Instead, the rate of increase has been far beyond all reasonable prophecy. In the twenty-seven years from 1880 to 1906, inclusive, the value of the mineral output of the United States has increased nearly five and one-fourth times. This marvellous growth is of additional interest in that it shows approximately by its fluctuations the financial ebb and flow of the whole country. From $364,928,298 in 1880, the value has risen gradually to the immense sum of $1,902,517,565 in 1906. This is the value of the mineral products in their first marketable condition, as shown in the first large tabular statement of the summary, where all unnecessary duplication is excluded.

It is of interest to note in passing that Pennsylvania produced nearly $600,000,000, or about 30 per cent. of the total value of the output of 1906; Ohio about $200,000,000, or 11 per cent.; Illinois, $117,000,000, or 6 per cent.; New York and West Virginia, $81,000,000, or 4 per cent. each; Montana, Colorado and Michigan, 3.5 per cent. each; Arizona and Missouri, 3 per cent. each; Alabama and California, 2.5 per cent. each. The value of the mineral output of each of the twelve States named was in excess of $50,000,000. If the combined value of output of eleven of these States ($905,000,000) be deducted from the total $1,902,000,000) the value of output of the twelfth State, Pennsylvania ($583,000,000), exceeds the combined value of output of all the remaining States of the United States by more than $150,000,000.

Keeping pace with this growth has been a system, and it is gratifying that the system has so expanded that the statistics of this wonderful production continually increase in completeness and accuracy. This attainment is largely the result of the hearty co-operation of the producers, due to their faith in the Survey.

In carrying out the plan of co-operation with the other divisions of the Geologic Branch a twofold advantage is secured. It brings to the statistical work on the one hand

a corps of trained men whose field observations have developed a keen appreciation of the geologic and economic importance of each mineral product. This has been particularly illustrated in the reports made by Mr. Lindgren and other mining geologists on gold and silver in the volume for 1905 and the reports on the same subjects and also on copper, lead, zinc and quicksilver in the present volume. On the other hand, the mining geologists have obtained and will continue to derive from their statistical work an insight into the industrial and commercial conditions which so largely affect the demand for the different minerals and lead to the search for and the development of the mineral deposits with the geological relations of which their field work makes them acquainted.

The bringing together of these two classes of study of our mineral resources, that of their geology and manner of occurrence, and that of their statistics and economic conditions, is to be one of the special features of the future work of this division.

MINERAL PRODUCTION OF BRITISH COLUMBIA.

By E. Jacobs.

(Continued from last issue.)

The returns are not yet in from all the lead-producing mines, consequently there may be the necessity later of reducing the quantity now shown as the approximate production. On the other hand, the former appears to have been based upon information obtained from the lead smelters of the province, the output of which and the estimated quantity shipped abroad are indicated in the following preliminary figures:—

From.	Lb. of lead
Hall M. & S. Co's smelter, Nelson	6,329,243
Con. M. & S. Co's smelter, Trail	21,686,079
Sullivan Co's smelter, Marysville, and others	10,631,036
Exported to United States and Europe	7,900,995
Estimated production in 1907	46,547,352

Even should the revised figures, when obtained, confirm the Provincial Mineralogists's estimate, there will still be a decrease in value of this metal of $348,714, of which, however, $140,000 is attributable to the lower average price in 1907 as compared with that of 1906.

East Kootenay's production of lead was about 38,000,000 pounds, the larger proportion from the St. Eugene mine; the Sullivan was the only other important producer in this district. In the Slocan section of West Kootenay, the Whitewater was the largest producer with something like 2,700,000 pounds. The Standard, Vancouver group, Hewitt, and Rambler-Cariboo, were other Slocan producers, while the La Plata, in Nelson mining division, and the Silver Cup, in the Lardeau, also shipped a considerable tonnage of silver-lead ore.

The closing of the Hall Mining & Smelting Company's smelter at Nelson, and a temporary suspension of smelting operations at the Trail smelter while there were labor difficulties at Crow's Nest Pass coal mines, whence comes the supply of coke, in a measure interfered with the production of silver and lead ores.

Copper.

The closing of the Boundary district copper mines, and others in the Nelson and Coast districts, respectively, during several weeks of November and December, effectually prevented an increase in the year's production of copper over that of 1906. There was also a restricted output during the spring owing to a shortage of coke for the smelters and an occasional insufficiency of railway cars for ore and coke-hauling purposes. These adverse conditions resulted in a decrease of rather more than 10 per cent. in quantity of copper produced. If calculated at the average price for 1906 the loss in value would be nearly $900,000, but as that for 1907 was about three-quarters of a cent a pound higher, the production for this year shows a net loss of only $610,000. When it is remembered that nearly 75 per cent. of the year's production came from the Boundary district, the effect of the closing of its mines during two to three months becomes evident. The Boundary's proportion of the total production of 38,392,000 pounds was nearly 28,000,000 pounds; Rossland and the coast each produced rather under 5,000,000 pounds; Nelson division's share was somewhere about 400,000 pounds. Of the 1,140,000 tons of copper ore shipped by Boundary mines, those of the Granby Company contributed 625,000 tons, of the British Columbia Copper Company 235,000 tons, of the Dominion Copper Company 155,000 tons, and of the Consolidated Mining & Smelting Company 125,000 tons. Rossland camp's ore tonnage was about 280,000 tons, in the following approximate proportions: Consolidated Mining & Smelting Company's Centre Star-War Eagle group 132,000 tons, Le Roi 113,000 tons, Le Roi No. 2 23,000 tons, and sundry smaller shippers 12,000 tons. On the coast the tonnage was approximately 100,000 tons, as follows: Britannia 57,000 tons, Tyee 12,000, Outsiders 9,000 tons, Marble Bay 7,000 tons, Richard III. 4,000 tons, Lenora, 2,000 tons, and sundries 9,000 tons. The Queen Victoria, near Nelson; the Outsiders, Portland Canal, and the Ikeda, Queen Charlotte Islands, were new producers, and the Richard III. and Lenora, Mt. Sicker, Vancouver Island, resumed ore shipping after having been non-producers for several years.

Iron and Zinc.

There was no considerable quantity of either iron or zinc ore shipped during 1907. At Vancouver and Texada Islands a few thousand tons of iron ore were mined and shipped to Irondale, Puget Sound, Washington, U.S.A. The most important event of the year in connection with the iron ores of the province was the examination by Einar Lindeman, a Swedish iron expert, of a number of claims taken up for iron ore on Vancouver Island and vicinity, for the purpose of reporting on them to the Dominion Department of Mines, Ottawa, which equipped him with the object of ascertaining whether or not iron ores occur in suitable quantity, variety, and quality, on the coast to warrant the expectation that an iron-manufacturing industry will eventually be established there. Mr. Lindeman's report has not been made public before returning to Ottawa in December he stated that of the many properties he had examined during his five months' work on the coast none of them could be considered

promising enough to warrant considerable development work to determine the extent of available ore; the quality he was satisfied with, but the quantity remained to be determined.

Shipments of zinc ore and concentrate were not large, and those made were from Slocan mines, several of which are, however, continuing to store the zinc concentrate made in milling ores for silver and lead. The uncertainty as to the final decision regarding the imposition of a duty on zinc ore sent to the United States remains an obstacle to much of this product being shipped to United States smelters. A comparatively small quantity was exported to Europe from a Slocan mine. No progress appears to have been made in the direction of operating on a commercial scale the Canadian Metal Company's zinc smelter at Frank, Southwest Alberta.

Coal and Coke.

The production of coal in 1907 was the largest in the history of coal mining in the province. The net increase over 1906 was 339,000 tons (2,240 pounds), this bringing the year's production of coal disposed of as such up to 1,856,600 tons. All three of the larger companies shared in this increase. There were about 357,000 tons made into coke. The respective approximate proportions of production were:—

Company.	Tons of 2,240 lb. Gross. Tons of 2,240 lb.	Tons of 2,240 lb. Net. Tons of 2,240 lb.
Company.		
Wellington Colliery Co.—		
Extension mines.. 434,000		
Comox mines ... 391,000		
	825,000	795,000
Western Fuel Co.—		
Nanaimo and Northfield mines	500,000	500,000
Totals for Vancouver Island	1,325,000	1,295,000
Crow's Nest Pass Coal Co..	877,442	550,600
Nicola Coal & Coke Co.....	11,000	11,000
Total production in 1907..	2,213,442	1,856,600

The Nicola Coal & Coke Company has been operating only about a year and most of its comparatively small production was of coal taken out in opening its mine. Several other companies will shortly be in a position to mine coal in quantities up to a few hundred tons a day each.

The coke output of the year was 227,000 tons—210,000 tons from the Crow's Nest Pass Coal Company's ovens at Fernie and Michel, and 17,000 tons from the Wellingtons Colliery Company's ovens at Union, Vancouver Island. In this year's estimate coal has been valued at $3.50 a long ton and coke at $6. In former years the respective prices were taken as $3 and $5, but the former are considered by the Provincial Mineralogist as average local market values for 1907.

The foregoing estimate differs from one made by the present writer early in December and sent to another mining journal. During the three weeks that have since elapsed, however, much more information has been obtained, hence the differences in the figures.

THE DEVELOPMENT OF THE LASH PROCESS FOR MAKING SOFT STEEL IN THE ELECTRIC FURNACE.

The Canadian Lash Steel Process Company, Limited, an Ontario organization, capitalized at one hundred thousand dollars ($100,000), and having among its stockolders a number of prominent men in Canada, has just about completed, and will have in operation inside of six weeks, the largest installation of an electric furnace for the making of soft steel ever attempted.

This company has purchased a building at Niagara Falls, N.Y., and is installing therein a fully equipped steel plant, to be operated in connection with a 1,000 horse-power Heroult furnace, for the purpose of making steel by the Lash Process.

The Lash Process consists of making a mixture of concentrated magnetic ores, or iron ore sands, granulated pig iron and carbon, and charging the same into either an electric or O. H. furnace and producing steel. It is not a direct process in the strict sense of the word, but is an ore and pig process, the ore, however, being greatly in excess of the amount of pig iron used, and practically eliminating the scrap, using only such scrap as is made in the regular operation of a steel works.

The amount of pig iron required to make a ton of steel is less than one-half of what is required in regular open hearth practice, when the mixer is used in an electric furnace, on account of its non-oxidizing atmosphere; this feature, coupled with the fact that the rest of the mixture is iron ore, which is, of course, the cheapest source of metallic iron, will produce a ton of steel ingots at a price much lower than they are produced in regular practice, either in the United States or Canada, figuring the electric power required at its regular market price as sold in large quantities.

Canada, beyond a doubt, with its vast deposits of magnetic ores and iron sands, and its water powers, should be able through the development of some such process to become one of the largest steel producing countries, and command an immense export trade. This company having previously made a number of experiments on a moderate scale, in which the results were encouraging, have installed this large plant for the purpose of making a practical demonstration on a commercial basis. The plant was located at Niagara Falls, N.Y., solely for the purpose of gaining time, this location making it possible to procure immediately a building, transformers, and the power required for their installation.

The supervision of the plant is under the immediate direction of Messrs. Fitzgerald & Bennie, of Niagara Falls, N.Y., and Robert Turnbull, of St. Catharines, Ont., the Canadian representative of Dr. Heroult, whose furnace they will installed.

Arrangements are being made with two of the best metallurgical and electrical experts in the world, one from England, and one from the States, to examine the process and make a full report. These experts will have every facility afforded them to watch the operations as the plant as before stated is being completed, with its laboratories, cranes, casting pits, etc., so as to operate night and day at a capacity of from 25 to 30 tons of steel per day. The steel after being cast into ingots will be sent into Canada to be rolled, and not only its chemical composition ascertained but also its physical qualities. The steel will then be shipped into the regular channel of trade.

Mr. Horace W. Lash, the president of this company, and the inventor of this process, has been connected for

years with the steel-making industry, and it was only after a long series of tests conducted by himself and a number of demonstrating heats made in the regular open hearth practice, that he permitted the process to be advanced as a commercial proposition. As to its use in regular open hearth practice, there seems to be no doubt as to the results.

Repeated tests show a yield above the average, a quality of steel entirely satisfactory, and a conversion cost not in excess of regular practice. Then it has been clearly shown that a better quality of steel is made, when the same is produced direct from the ore, instead of through the scrap and pig process.

In the electric furnace the quantity of pig iron required is very much reduced, owing to its being smelted in a non-oxidizing atmosphere. As pig iron is the most expensive material used in the making of steel, the reduction of its proportion results in a corresponding saving, and when the use of this pig iron is coupled with the ores themselves, the cost of producing a ton of ingots is much lower than the best practice ever brought out.

This process is, of course, a most interesting development for Canada, which country does not possess the required fuel, but does possess the water powers and the raw material; therefore, the results of these experiments will be most interesting. We are promised a report of these results after the plant is in operation.

Briquetting of Fuels in British Columbia—Description of Pacific Coal Company's Plant at Bankhead, Alberta.

By G. J. Mashek.

(Continued from last issue.)

All bearings are self oiling and the registering gears that actuate the second roll are also cut and have very wide face so as to practically eliminate any wear in that portion of the machine.

Figure 4, shows the type A Mashek briquetting press as installed in this plant. The briquetting rolls in these machines are made up of discs as shown in Fig. 5. The briquettes made in this machine are pillow-shaped, rectangular in one direction about 2 1-8 inches square by about 1 3-8 inches thick.

The object of making the press rolls of discs, all sides of which are machined, was for the purpose of making it possible to mill out the briquette pockets, as up to the time these machines were built it was found impossible to cast rolls in one piece.

The face of the roll shows dividing ridges about 1-6 inch wide between the briquette pockets, so that the full face of the roll is used at all times, making no waste and leaving no fines on the briquettes, as is common with the eggette shape made by the Belgian type press. This also saves a considerable amount of power in operating the machine. The power required is about 22 H. P. to turn out 12 tons per hour. The rolls made in this manner are the most expensive part of these presses and owing to the fact that the material from which they are made had to be soft enough to be machined and milled, considerable wear on these parts was caused, which required frequent renewals. This problem has within the last year been overcome by making the roll shells in one piece with pockets cast in, the material being so hard that it was necessary to grind the outer edges of the pockets. The life of this roll shell is about three times that of the built up one with milled pockets.

The construction also enables the machine to make better shaped briquettes leaving the corners more blunt. The briquettes drop out of the briquetting rolls on a belt conveyor and are taken to a distributor placed over a travelling cooling table, where they are dsitributed evenly over a width of 6 feet.

The cooling table consists of three endless belts made up of heavy roller chain, one chain on each side, running on channel iron tracks with spacing rods between the chains, on which are placed steel plates about a foot wide. These plates are held in the horizontal position by means of tee iron tracks, and as they approach near the end of their run the track drops away and the load is gently lowered and discharged on the other side of this same belt. The briquettes thus pass from one course of the cooling table to the other until they are thoroughly cooled. At the bottom they are delivered to a scraper conveyor as shown, which conveys them to the shipping bins of the breaker allotted for this purpose. The briquettes remain on this cooling table about one hour. It is absolutely essential in all briquetting plants, if the

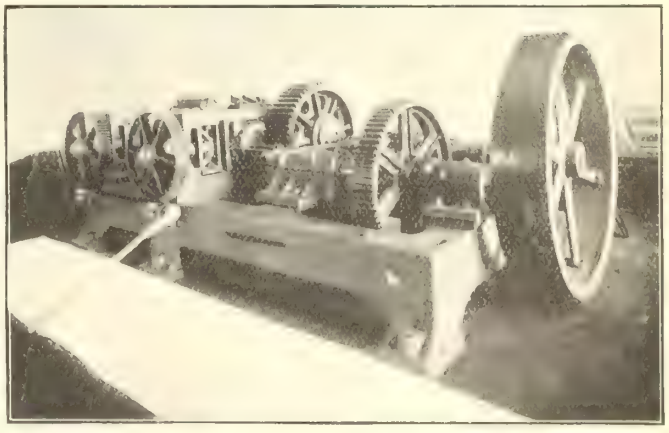

Figure 4.—Type A, Mashek Briquetting Press.

product is to be dropped into bins, that the briquettes be thoroughly cooled so as to avoid the possibility of smashing them on account of the inside of the briquette being still hot, although the outside may appear cool. Once the briquettes are thoroughly cooled there is absolutely no danger of them softening again in any temperature, nor is there danger of spontaneous combustion.

The pitch used in this plant is of ordinary roofing hardness, and grade D oil residuum asphaltum would be just as suitable for this purpose.

The pitch melting is done in a separate house as shown in Fig. 1, where the barrels are hoisted by a barrel ele-

vator to the second floor. On this floor the barrel staves are removed and the contents are dumped into any one of the three melting tanks. These melting tanks have a capacity of about 18 tons each and are set in brick-work heated by means of coal fires. They are set in such a manner that direct heat from the fire does not strike any part of the tank, thereby avoiding any danger of carbonizing the pitch, or of overheating any portion of the melting tank.

It requires from 20 to 24 hours to melt a tank full and raise the temperature of the pitch up to about 250 degrees F. After the pitch is melted it is pumped by means of a pitch pump through a 4-inch pipe to a similar tank in the briquetting plant, out of which it is being continually used while the plant is in operation. Three melting tanks are sufficient to keep this plant going 24 hours per day, although if more were installed the melting could be done a little slower which would also provide a reserve capacity at a vital point of the plant. Each unit of the briquetting plant is operated by a double 14 x 20 cylinder engines. The steam for the plant is obtained from the breaker boiler house, placed some distance away. For the atomizing purposes it is absolutely essential that the steam be dry and as hot as possible. For this purpose there is a steam superheater next to the melted pitch tank.

All the machinery shown on the plan is placed on the ground, the building is a frame structure of just sufficient strength to withstand the snow loads and carry the over-head line shafts. The cost of this plant complete according to original estimates was as follows:—

Machinery, F. O. B., New York, 350,000 pounds	$40,053.00
Duty 25 per cent.	10,000.00
Freight at $1.80	6,300.00
Building and erection of machinery.	29,000.00

The total cost of the plant as outlined is $85,353. This estimate was later modified by buying a large portion of the equipment in Canada and saving the duty. The cost of operation per ton of briquettes after a carload sample had been briquetted in the United States is given below. This cost was arrived at by the writer and Mr. Bruce R. Warden, M. E., the Pacific Coal Company's representative, and all items were put in at the highest cost in order to be on the safe side.

Cost of Running a 2 Unit Coal Briquetting Plant.

Binder at $10.00 per ton at Fort william, $6.00 freight to Banuff using 7 1-2 per cent. gross cost per ton of briquettes	$1.20	
Deducting the increase of weight of briquettes by addition of 7 1-2 per cent., binder valuing briquettes at at $3.50 per ton, in bins of plant	.25	
Net cost of binder per ton briquettes		.95
Labor per day—		
1 Watchman	$2.50	
1 Dust conveyor attendant	2.50	
1 Cooling table and briquette conveyor man	2.50	
2 Men in binder melting room and general labor	5.00	
1 Oiler	2.50	
2 Men to run the two units	8.00	
1 Superintendent	6.00	
Total	29.00	
10 Hour day making 220 tons of briquettes per ton		.131

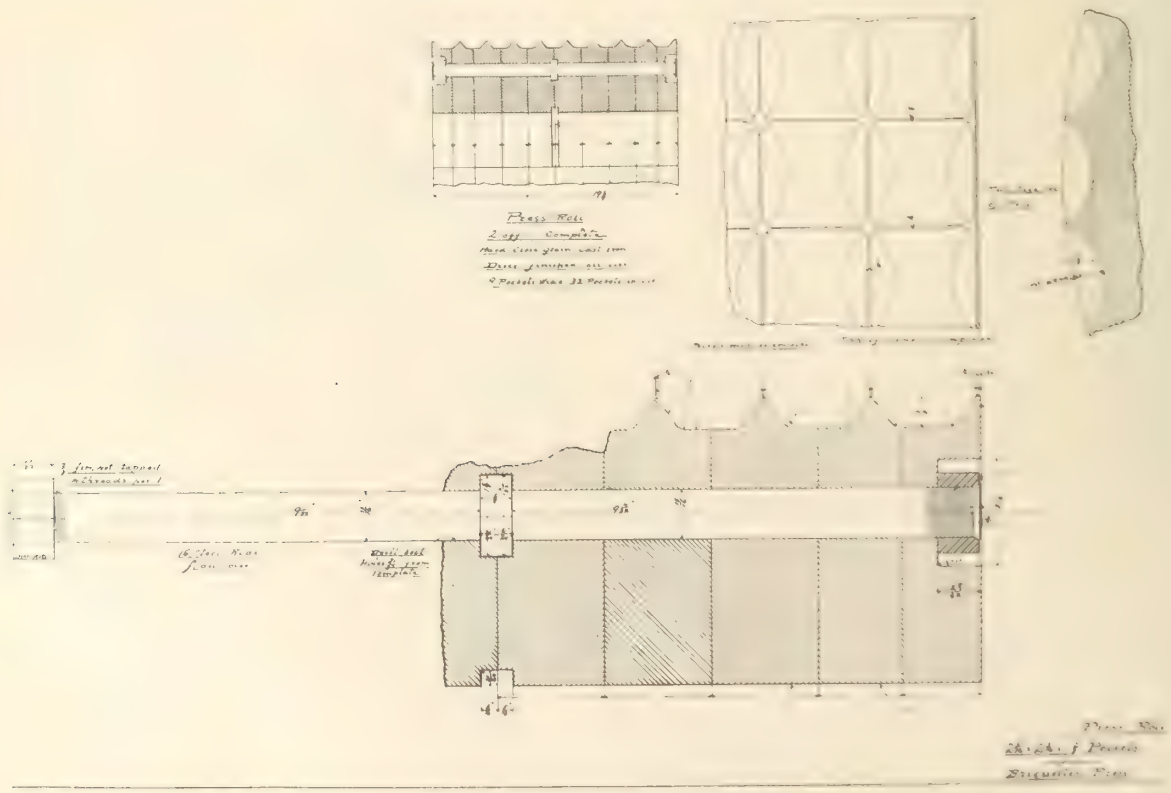

Figure 5.

Fuel Oil	
2 1-2 gallons per ton at 5 cents per gallon	.12½
Power—	
300 H. P. coal for boilers at 40 cents, engines using 50 pounds of steam per H.P., and heating plant, cost per ton of briquettes	.05
Lubricating Oil	
Per ton	.01
Breakage—	
Rebriquetting breakage of 5 per cent. between press and shipping cars	.04
FIXED CHARGES.	
Interest—	
Capital invested $86,000 at 6 per cent., plant produces a minimum of 50,000 tons per annum—per ton	.10
Depreciation, wear and tear—	
Per ton	.10
Insurance—	
$50,000 at .02 per cent., per ton	.02
Office expense—	
Bookkeeper, stenographer, stationery at $3,000 per annum	.06
Total cost of manufacture (coal dust not included)	1.59

It will be noticed that fuel oil is figured in at 5 cents a gallon, but as stated above it was found that this oil would cost considerably more. Coal furnaces instead of oil furnaces were therefore installed to heat the dryers and mixers. This item, therefore, should be cut out and the cost of coal for this purpose put in. The cost of coal, however, is considerably less than oil.

As this plant was originally planned and designed as shown in Figure 1, only one unit of the briquetting machinery was installed. After that was in operation about a year the other unit was put in which at the present time ought to be about ready to start. The single unit has recently produced 9,100 tons of briquettes per month.

The atomizing of the pitch into the mixers as described about is patented in Canada and the United States, for the use of which there is a royalty of 10 cents per ton charged by the owners. There are a number of these plants in operation in the United States, equipped with a later design of press, and other improvements in mixers, etc. Also an improved method of introducing pitch into the coal dust has been developed and patented. This apparatus is sold outright and no royalty charged.

EXAMINATION OF WELL WATER AT COPPER CLIFF.

J. W. RAWLIN.

During the summer and fall of 1906 the Town of Copper Cliff suffered severely from an epidemic of typhoid. An examination of the water in many of the wells showed extremely high chlorine, and the worst of them were closed. Samples of the water were also sent to Toronto, to be tested at the laboratory of the Provincial Board of Health.

Owing, however, to the length of time that necessarily elapsed while the samples were in transit, the results returned were not very satisfactory.

It was felt that the only really satisfactory method was to test the water on the spot, and, during the winter of 1906-07, the Canadian Copper Company took the necessary steps to effect this, and, if possible, forestall a recurrence of the fever the following summer. With the assistance of Dr. Amyot, Provincial Bacteriologist, the necessary supplies and apparatus were purchased, and a competent man secured to carry out the tests. A room in the new laboratory was set apart especially for water analysis, and the systematic testing of the wells begun in May, 1907, with Mr. C. E. Rowland in charge.

In addition to the usual chemical tests for chlorine, free and albuminoid ammonia, a fairly complete bacteriological examination was also made, and indeed this proved much the more valuable. It is especially worthy of note that many of the wells that gave a low chlorine test proved really to be badly contaminated. This was undoubtedly due to infection from the pails used in dipping out the water, each one bringing his own pail and using it for that purpose. The remedy in this case was simple. The well was thoroughly cleaned, and provided with a bucket fixed at the well, or with a pump.

There were other wells, however, which showed high chlorine in conjunction with high bacteriological contents. These were evidently contaminated with sewerage and were closed. At others, which could only be called doubtful, notices were posted warning the users to boil the water for drinking purposes. The nature of the soil here makes it a very efficient filter, and, if a well were protected from surface contamination and sunk in a reasonably good place, the water obtained is excellent.

All glassware used in connection with the bacteriological tests was sterilized in a dry heat at about 150 degrees C. The sample, after being collected in a sterile, glass-stoppered bottle, was brought at once to the laboratory, and usually three tests made as follows:—

(1) A 1 C. C. portion was sown in agar-agar in a Petri dish, and left in a dark, moist place at the ordinary temperature, and afterwards the colonies were counted. Unless the count here were extremely high, water was never condemned on this test, as most of the bacteria growing at this temperature are quite harmless.

(2) Another 1 C. C. portion was also sown in agar-agar in a Petri dish, but incubated at 37 to 40 degrees C., and the colonies counted, using a Wolffheughl counting apparatus. Any growth at this temperature, which is approximately that of the body, was pretty certain to be dangerous, and, if obtained in addition to gas formation in (3), was considered sufficient evidence to condemn a well.

(3) A third 1 C. C. portion was introduced into a fermentation tube (a U tube with one closed arm) containing a meat broth and incubated at 37 degrees C. A gas formation in the closed arm, of which approximately 33 per cent. was CO_2 and the balance H, gave a practically certain proof of the presence of colon bacilli. Microscopic slides were made from the fermented liquid, and, under a high power miscroscope, the presence or absence of streptococci and staplylococci noted. Slides were also made from different colonies on the agar-agar, and the bacilli in these determined. Other slides were stained with the approprivate colors for examination under oil-immersion lens.

Ordinarily the above tests were sufficient, but many others were made, such as growths on litum-lactose-agar plates, cultures in agar tubes, etc., for further confirmation. Using a quantity of the water as large as 1 C. C. made the test a somewhat severe one, but, under the circumstances, it was better to err on the side of severity than pass a water which might only have been termed doubtful if a smaller quantity had been used.

It is satisfactory to be able to record the fact that, owing to the measure taken, the town was practically free from typhoid during 1907. There were two or three cases only, and these of a comparatively mild type.

MINING IN THE KOOTENAYS, ETC.—A SUMMARY OF THE PAST YEAR'S WORK.

George A. Ohren.

The year which has just closed would have been a banner one for the Kootenays in the way of ore production had it not been for several drawbacks. In the early part of the year we had the transportation difficulties to deal with, then the trouble between employers and labor in the Crow's Nest Coal fields, car shortage, a hitch in the labor situation in the copper producing district, and what hurt most, the shortage of coke and fuel, which affected nearly all of the mining and smelting communities. However, taking the production and the business for the year it was a very good one for the mining industry here, and even with all the difficulties that cropped up, the total tonnage nearly came up to that of the year 1906. If things go at all smoothly during the year that now lies before use, we will be able to report a list of production and values that will beat anything that has been recorded heretofore. Of course this will depend to a greater or less extent on the values of copper, silver and lead strengthening a little above what they are at present, which is something we are all looking for.

In the Rossland district we can well say that things have taken a step forward; this applies more particularly to the operations of the Consolidated Mining & Smelting Company of Canada here. They have acquired a lot more territory, have done much development work on it, disclosing new ore bodies, have installed an up-to-date electrical and compressed air plant for mining and hoisting the ore, and to make a long story short have an excellently equipped and working property, with more ore in sight than they ever had before. This property is now down a depth of over 2,000 feet, and work is planned for still further depth.

At Le Roi mine they have not seen fit to add much more machinery to their already well furnished plant, and the principal improvements there during the past year have been in the way of development work, the cardinal part of which was the sinking of the main shaft from the 1,450 to the 2,000 foot levels and prospecting the ground between by drifts, winzes, diamond drill, etc. While the profits have not been enormous for the year's work, partly owing to the heavy expenditures for all this preparatory work, still the mine is looking well and there is ore enough in sight to keep the plant going for several years.

The Le Roi 2, Limited, has worked along steadily during the past twelve months mining and shipping some very fine copper ore and milling many tons of second-class ore. The company has by good management and rigid economy made money and can no doubt excel their record during 1908.

The Granby mines in the Boundary have acquired a lot more ground and have added materially to their machinery plant. They have increased their smelting capacity; have put in a couple more of the fifty-two ton crushers, etc.

The Consolidated Company at the Snowshoe mine have made great progress. They have opened up a lot of good shipping ore, which is of primary importance, have acquired an extensive group of mineral claims, and have added more air compressing machinery, electrical locomotives for underground haulage, etc.

The British Columbia Copper Company have also made many improvements about their property, have augmented their crushing plant by a monster crusher, are installing a new rope driven compressor, and have the mine working in fine condition with plenty of ore blocked out and development work well advanced.

The Dominion Copper Company installed two new compressors and more blast furnace capacity, besides other smaller additions, and are in a good position to make money during the coming year. It is anticipated that they will be in operation again in the next two or three months.

In the Slocan-Kootenay district the Consolidated Company's St. Eugene mine, the Sullivan, La Plata, Eva and other well known properties have all advanced in the way of improvements and now stand a step higher up the ladder than they did at this time a year ago.

Following are the ore shipments from Rossland for the calendar year ended December 31st, 1907, estimated:—

	Tons.
Centre Star mines	137,500
Le Roi	113,538
Le Roi 2, Limited	23,500
Le Roi 2, Limited (milled)	2,470
White Bear	2,729
White Bear (milled)	3,350
Others	253
	283,340

From the Boundary:—

	Tons.
Granby	613,567
Mother Lode (B. C. Copper)	208,321
Snowshoe (Consolidated	128,674
Rawhide (Dom. Copper Co.)	64,173
Brooklyn (Dom. Copper Co.)	44,101
Sunset (Dom. Copper Co.)	31,258
Emma (B. C. Copper)	18,274
Providence (high grade)	708
Others	39,259
Total	1,148,337

From Slocan-E. Kootenay:—

	Tons.
Sullivan	31,500
St. Eugene (Cons.)	23,067
La Plata	3,250
La Plata (milled)	20,000
Eva (milled)	6,500
North Star	2,889
Rambler, Cariboo	538
Ymir	305
Payne	55
Others	97,743
Total	185,857

Aproximate smelter receipts were as follows:—

	Tons.
Trail smelter (Consolided)	266,994
Northport smelter (Le Roi)	101,178
Granby, Grand Forks	628,001
B. C. Copper, Greenwood	326,295
Dominion Copper, Boundary Falls	154,793
Hall M. & S. Co., Nelson	11,340
Marysville (Sullivan)	31,850

The Crow's Nest Pass Coal Company, the largest producer, mined:

	Tons.
Coal	982,735
Manufactured into coke	366,076
Exported to U. S.	327,100
Shipped to Canadian points	237,459
Sold locally	2,949

The Provincial output, taking it all around, showed an increase of $4,636,625. Estimated value of the grand output is:

Gold, placer	$ 700,000
Gold, lode	5,426,500
Silver	1,900,000
Lead	3,000,000
Zinc	125,000
Copper	9,874,000
Total metalliferous	$21,025,500
Coal	6,490,000
Coke	1,135,000
Building material	1,200,000
Total production	$29,850,500

Taking it all in all there is no complaint to make about the production from the British Columbia mines for 1907 and when it is all boiled down there is a balance on the credit side of nearly five million dollars, which goes to bear out what we have tried to indicate in the foregoing, that the mining industry has steadily marched forward during the past year and to-day occupies a much more prominent position than it did a year ago.

The year 1908 opens out in a most propitious manner for the mining industry and if the metal market will only pick up a little there is little doubt that the records on the 31st of December next will far exceed those mentioned above, for labor seems to be on a most amicable footing with the employer here, transportation facilities are in very good condition and the mines are in better position than they have been for a long time to make record breaking shipments.

TUBE MILLS.

The following article is interesting, not only to parties who are in some way connected with the construction or use of the special machines herein described, but also to students, or others, who have an interest in mechanism. The article proves that by changing the method of applying the power to drive such machine, an immense saving of power can be accomplished.

The accompanying cuts give an illustration of two rotary pulverizing cylinders, also called tube mills, or pebble mills. One of these cylinders is resting on journals in bearings (Fig. 1), extending from the heads of cylinder. The other cylinder, with its steel tires fastened around the same, rests on wheels (Fig. 2). Both cylinders are loaded up to the centre. The first, the gudgeon cylinder, is operated by a pinion on a countershaft driving a gear wheel. This gear is generally placed around the circumference of the head of the cylinder, and the motion transmitted by the pinion to the gear wheel rotates the cylinder around its axis, and thus in the cylinder of the style of Figure 1 the entire load has to be lifted about its axis in its operation. The other cylinder (Fig. 2) has no gear wheel around its head, and has no axis about which the load has to be lifted. The power to rotate the cylinder, as in Figure 2, is

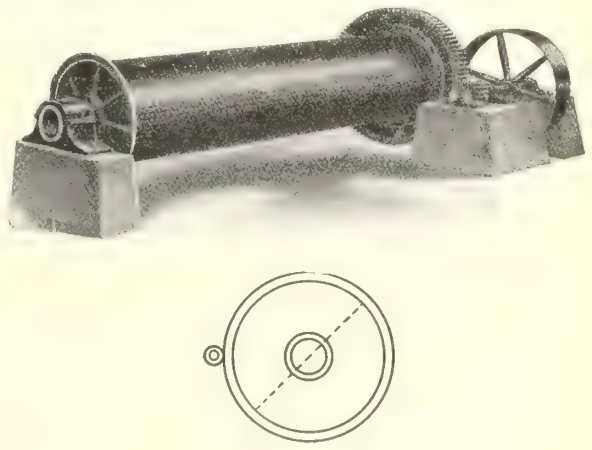

Fig. 1.

transmitted by rolling friction, by the aid of the centre driving wheels, on which the cylinder rests. The entire weight of the load and cylinder is balanced on the centre driving wheels, and when the motion is transmitted to rotate the cylinder, half of the load is balanced on the centre driving wheels, and consequently only one-half of the entire load must be lifted while the cylinder is in operation.

The inventor of this device, Mr. R. F. Abbe, president of the J. R. Alsing Engineering Company, of 136 Liberty street, New York, who handles his inventions, claims and intends to prove theoretically by the following explanation the amount of power that can be saved in driving such machine with his patented driving system, although it might be mentioned that practical demonstration has proven a higher percentage of saving in power than is proven theoretically.

The simplest explanation of how the saving of power is accomplished is the following:—

For a Tube Mill as Style Shown in Figure 1, Old Style.

A tube mill or pulverizing cylinder, say 5 feet in diameter by 22 feet long, has to carry a load of about 23500 pounds, consisting of flint pebbles and the material

to be ground. The centre of gravity of the load is 1.6 foot from the centre of the tube mill, and as the mill makes 25 revolutions per minutes, consequently we have 23500 x 1.6 x 25, or 940000 foot pounds to lift about the gudgeon per minute.

There are 33000 foot pounds in one horse-power, hence 940000÷33000 equals 28.485 horse-power plus the friction and weight of the entire cylinder, and load on bearings, which is equal to 21.845 horse-power, of which 10.495 horse-power is for friction and 11.350 horse-power for weight of cylinder.

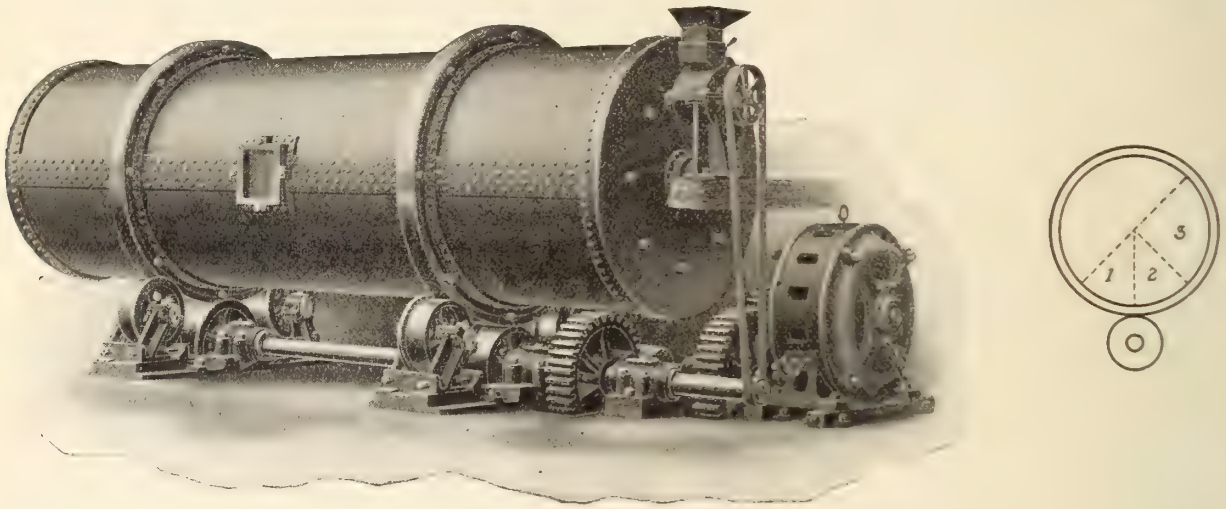

Fig. 2.

Thus 28.485 plus 21.845 equals 50.330 horse-power, which is required to operate a 5 foot x 22 foot tube mill running on gudgeons (Fig. 1).

For a Tube Mill as Style Shown in Figure 2, New Style.

With Mr. R. F. Abbe's patented driving system the tube mill rests with its entire load on the centre driving wheels, the two side wheels acting only as guides. As illustrated by sketch in Fig. 2, one-half of the entire load is balanced (section 1 balances section 2), and carried by the centre driving wheels. Therefore only one-half of the entire load is required to be lifted in this style of tube mill. Consequently it takes one-half of the 28.485 horse-power (which the other style of cylinder required for the same load), namely, 14.2425 horse-power. As the horse-power for friction and weight of cylinder is 18.4892, of which 7.1392 horse-power is for friction and 11.350 horse-power for weight of cylinder, then 14.2425 plus 18.4892 equals 32.7317 horse-power, which is required to operate a 5 foot x 22 foot tube mill with Mr. R. F. Abbe's patented system.

Therefore 50.330 minus 32.7317 horse-power equals 17.5983 horse-power actually saved by the use of this patented system. This shows 35 per cent. of the horse-power saved.

In the above calculations the weight of the cylinders has been assumed to be equal in both style pulverizing cylinders, although by actual detailed estimation it has been shown that on account of the large gear wheel and heavy gudgeon heads used on the cylinder (Fig. 1) the same is heavier than the other cylinder (Fig. 2) by over 6,000 pounds, and thus this will increase the saving in power in the cylinder of Figrue 2 (patented driving device).

BOOK REVIEWS.

THE ELECTRIC FURNACE — ITS EVOLUTION, THEORY AND PRACTICE. BY ALFRED STANSFIELD, D.Sc., PROFESSOR OF METALLURGY IN McGILL UNIVERSITY. PUBLISHED BY "THE CANADIAN ENGINEER," TORONTO, 1907. PP. XI. + 211—9 BY 6. PRICE $2.00.

"In this book," Dr. Stansfield's introduction tells us, "it has been the author's purpose to trace the evolution of the electric furnace from its simplest beginnings, and to set forth, as briefly as is consistent with clearness, the more important facts relating to its theory and practice."

In seven chapters, following each other logically and smoothly, Dr. Stansfield traces the history of electro-metallurgy, describes and classifies electric furnaces, compares their efficiency with that of other fuel furnaces, goes briefly and completely into matters of construction, design and operation, dwells upon the uses of electric furnace products and concludes with a chapter on future possibilities.

The book is well written. It can be intelligently read by secondary students. It is thoughfully put together and amply illustrated. After reviewing the present sources of electrical power, Dr. Stansfield concludes by alluding to Lord Kelvin's suggestion that the ether may be a future source of limitless supplies of power. "We can," adds the author, "await with quiet minds the exhaustion of the coal supplies of the world."

A text book upon the electric furnace has been needed. The ordinary reader can derive but little benefit from special reports. Hence even a general knowledge of modern electro-metallurgy is rare. Dr. Stansfield has succeeded in presenting in compact form a crisp, understandable treatise on a subject of growing importance. His book is a well-digested summary of the latest and best literature.

MINING TABLES—BEING A COMPARISON OF THE UNITS OF WEIGHT, MEASURE, CURRENCY, MINING AREA, ETC., OF DIFFERENT COUNTRIES; TOGETHER WITH TABLES, CONSTANTS AND OTHER DATA USEFUL TO MINING ENGINEERS AND SURVEYORS—BY F. H. HATCH, PH.D, F.G.S., AND E. J. VALLENTINE, F.G.S. MACMILLAN COMPANY OF CANADA, LIMITED, TORONTO. PP. 200—8 1-2 x 5 1-2. PRICE $1.75.

The usefulness of this book will be at once recognized. In it are collected and arranged the tables of weights and measures used by the principal nations of the world. Definitions of units of force and energy are given. Amongst other most useful (but usually unfindable) information are tables of conversion of British, Metric and Russian units.

In Part V., under the heading "Data Specially Relating to Mining," are to be found tables of much more than usual value. In these both the long and the short ton are used. The tables giving ore tonnage per unit area for veins or beds one foot thick and of unit density for each degree of dip from 0 degrees to 85 degrees, are the outstanding feature of this chapter.

Section V. of Part V. defines briefly the unit mining area of different countries. The Transvaal Claim for vein and reef mining has an area of 60,000 square Cape feet. It is usually rectangular in form and measures 150 Cape feet along the strike by 400 Cape feet in a direction at right angles to the strike. The Cape foot, incidentally, is equivalent to 1.033 English feet.

Similar data are given for many other countries, including Canada. The fact that Alberta and Saskatchewan have been erected into provinces has, apparently, been overlooked.

Data relating to measurement of the flow of water, storage of water, flow in pipes, air, steam, along with trigonometrical and other formulae, surveying data, tacheometric tables, tables of chords, etc., etc., help to complete this well-compiled volume.

JOURNEYS OF OBSERVATION—BY T. A. RICKARD. PUBLISHED BY THE "MINING AND SCIENTIFIC PRESS," 667 HOWARD ST., SAN FRANCISCO. PP. 500. CLOTH, $3.50. AUTHOR'S EDITION, $5.00.

Although we had previously read most of the delightful letters that together make up the volume, it was a light and pleasant task to read them again.

The author, in his preface, remarks that "this book records the observations made by a traveller who happened to be a mining engineer." To this we may add that Mr. Rickard has the good fortune to be a mining engineer with a mind cultivated by experience, wide reading and sympathetic observation. He is, moreover, a master of the English language.

As befits a sound and honest observer, Mr. Rickard clothes his thoughts in simple, straightforward words. He is no stylist. His sentences are clean-cut. His paragraphs are well constructed. His diction is simple.

Two hundred and fifty pages of the volume are taken up with the record of a journey from New York to Mexico, together with a description of the mining industry of El Oro, Pachuca and Guanajuato. The Spanish Conquest, Vein Formation, Tube Mills, Meteorites, Cortez, the Great Shafts of the Veta Madre, How to Sample, are a few of the diversified topics touched upon and woven into a charming and coherent whole.

The non-technical reader can follow the whole narrative and carry away a clear impression of Mexican mining. The mining engineer can read it with the same amount of pleasure and a super-added sense of profit; for the mining and milling practice of the districts mentioned above is lucidly and adequately described.

It is this unusual combination of scientific accuracy and truly artistic literary skill that makes Mr. Rickard's writings what they are.

We know of no other volume that will give the reader so vivid and so exact a picture of Mexico.

The second part of the book is an account of a ride over the mountainous mining regions of Southeastern Colorado.

Although, like the preceding narrative, it contains a startling variety of subjects, yet there is no confusion. We find ourselves quite as deeply interested in the secondary enrichment of copper veins as in the assassination of brave Arthur Collins.

For the "peckish" reader the volume is plentifully spiced with anecdotes and varied by excursions into history and the realm of human nature. For the student there is an ample supply of scientific pabulum, served rarely well.

We would that space allowed us to quote extensively from any or all of the chapters. But we must be content with one excerpt.

Descending the mountains on their way to Ouray, Mr. Rickard's party came suddenly into full view of the Uncompahgre valley. A storm had just passed. Mr. Rickard describes the scene: "The storm had swept northward, the sky was still partly overcast with flying cloud, a luminous atmosphere, pure as interplanetary space, filled the canyon depths, and from the west the sunlight pierced the lingering mists with mellow light . . . Across the canyon the terraced slopes descended in parklike gradation, resplendent with their livery of autumn, and above their aspen gold the bastions of blue-gray andesite rose tier after tier in Gothic severity of line until belted with the rising mists." A few pages before these lines occur, we came upon an analysis of anthracite coal. Yet there is continuity and sustained interest in every chapter of the book.

Antimony pigments are being favored by the French and Italian Governments. The advantage is claimed over white lead in being non-poisonous and over zinc paint in being permanent and sun-proof.

Tellurium is a practically useless metal. At little is used in medicine, but it is stated that a day's yield of a single copper refinery would stock a large chemical supply house for a year's trade.

Uranyl molybdate, the remarkable new radioactive substance of Andre Lancien, a French student of pharmacy, is prepared by adding ammonium molybdate to uranyl nitrate, when a white amorphous powder separates. This powder is collected and dried in the dark. It is claimed to be as powerfully radioactive as radium bromide, and to have substantially the same effects, while its cost—though high, at $110 an ounce—is low compared with the radium salt at thousands of dollars an ounce.

TRAGEDY IN DIAMONDS.

ALEXANDER GRAY.

The casual reader of daily papers has doubtless dismissed as unimportant the brief cable to the effect that the police of Paris are seeking a humbug named Le Moyne, who fleeced Julius Wernher out of a third of a million dollars. Not knowing the ramifications of the victim of this swindle, the laity not recognizing in the name the chief of Messrs. Wernher, Beit & Company, probably the greatest mining firm in London, the mere fact that a glib-tongued sleight of hand magician had dexterously substituted a genuine diamond for something or other alleged to be of manufactured excellence equaling the real, has been dismissed without other than casual consideration.

Since the principal who parted with 1,600,000 francs is Sir Julius Wernher, Bart., a director of De Beers Consolidated, chairman of Fraser & Chalmers, Limited, the central figure of Witwatersrand mining, and one of the very best types of mining magnates, the incident becomes doubly interesting, in that it rather confirms the expectation among savants that diamonds will, sooner or later, be manufactured economically, perfectly, in quantities and qualities. Not only is Sir Julius Wernher a leading personality; he is a chief factor in the diamond trade, and to his firm is allotted almost 40 per cent. of the profits accruing to the diamond syndicate regulating the output of South African diamonds. How he was bamboozled by Le Moyne may not be revealed, although the publicity given the transaction evidences the determination of Sir Julius to expose the alleged necromancer; but the anxiety of so well informed a mining master to be a party to even the faked discovery will be consolatory to those who were "gold bricked" by Highland Mary promoters, to these who are finding out that tarradiddling is not confined to Ontario flotations.

With Sir Julius the incentive to protect his market is self-evident, more especially in view of the precarious state of the diamond trade. De Beers mines are working half time when they could put out in a twelve-month diamonds valued at $40,000,000 to $50,000,000. The Diamond Syndicate has refused to sell rough diamonds, that is uncut stones, for two months, to enable dealers to get rid of what they have in stock. Banks will not advance as freely against precious stones as security, a security, by the way, which has been safe as gilt-edged paper. Importations to America in December fell off to the extent of $4,000,000, as compared with the same month in 1906. Diamonds carried by dealers mount into the millions. The purchasing power of the public being distrait, impairment of capital is a distressing item in households, and to those in the trade. America has been the best of the De Beers clients, but it took $11,860,443 less in diamonds in 1907 than it did the year previous. If Le Moyne had convinced Sir Julius Wernher and his colleagues that he could chemically create diamonds, the New York panic would be a trivial affair in comparison to what would happen in the jewellery trade. As it is, De Beers shares are selling at half their price of a year ago, and strenuous efforts are being made to maintain the market value of the stone. The output of the Premier mine is bringing about 50 per cent. of what it was valued at two years ago by the chairman of that phenomenal company. Roberts Victor mine shares are 700 per cent. lower than they were. To have Le Moyne appear with a lustrous stone, apparently produced in his laboratory, in view of all this, was justification for Sir Julius advancing a tidy amount on account. When Sir Julius asked for a further demonstration, Le Moyne is said to have betaken himself to less troublesome quarters.

It was explained in THE CANADIAN MINING JOURNAL a while back that the De Beers Mines have a century's supply of diamonds awaiting extraction. The Premier Company have extraordinary possibilities as an individual proposition. Should Parisian chemists achieve with the diamond what they have with chemically produced sapphires and rubies, gems now ranging from $100 to $1,000 per carat, would be as plentiful as beads. The element of rarity and purity present in the diamond when attained—if attained—is what induced Sir Julius Wernher to take the risk in the belief he had found the pot of gold at the end of the rainbow.

The diamond is serene. Sir Julius may not be—but it might have been worse—for De Beers shareholders and the Nouveaux riches.

EXCHANGES.

The *Engineering and Mining Journal*, January 18th.—A special correspondent describes in this number of our contemporary "Slate Mining in Wales and Cause of its Decline." Decrease of building activity, foreign tariffs, and the keen competition of French producers have combined to paralyze the English slate mining industry. The great Penrhyn strike, which removed a monthly output of 10,000 tons from the market caused other Welsh producers to put up prices. A reaction set in and consumers began to look abroad for supplies. French slates, from the district of Angers on the Loire, found favor and have kept hold of the market.

The slate-producing districts of Wales are "bleak, chilly and damp places to live in."

The same is true of the Cornwall districts.

The new law making English employers responsible for all accidents and illnesses contracted by employees in the course of their duties has brought about intolerable conditions in the slate mines.

The slate mining of Wales is centred at the Penrhyn and Dinorwic quarries, where the work is open cut, and at Festiniog, where most of the slate is won from underground. There are also many smaller quarries, either worked on a small scale or abandoned.

The Oakley mine is by far the most important of the Festiniog group. The management is modern and progressive and the equipment is excellent. The yard is situated in the town of Blaenau Festiniog and is about 900 feet above sea level. The mine buildings and dressing houses are at the top of an incline 500 feet higher. The slate veins dip to the north at about 30 degrees from the horizontal. They are worked entirely in underground chambers, in a series of horizontal floors about 60 feet apart.

On each floor there are a number of chambers from 50 to 70 feet wide, separated by walls about 40 feet wide left in the slate. The chambers from one floor to another are usually continuous. The various chambers and

floors are connected by tunnels through the walls and by means of adits and tunnels outside. There are altogether 26 floors. The vertical depth between the top and bottom is 1,430 feet. There are five veins running from a minimum of 30 feet in thickness to 300 feet. They are all worked. The normal output is 4,000 tons of slates per month. About 1,600 men are employed.

The plant for hauling and pumping is modern. Electrical power is used. Current is obtained from a water power generated from the waters of a lake on the side of Snowdon. It is brought eight miles over the hills at 10,000 volts.

The manufacture of slates and slabs is as usual. Suitable pieces are sent to the slab-house, where they are sawn to shape and planed smooth. Everything except the splitting is done by machinery driven by electric motors.

Mining Science, January 16th.—Under the title "The Wisconsin Mining Trade School," R. B. Brinsmade outlines the courses and aim of a new institution at Platteville. The Wisconsin State Legislature is opening the doors of a new institution for secondary mining education. The minimum age limit is set at 15 1-2 years, and the course is only 2 years. The entrance requirements are mainly a knowledge of arithmetic and the use of the English language. Tuition is free and by a co-operative arrangement board and lodging may be obtained at the rate of $3 per week. The expenses of laboratory materials and books are kept low. It is possible for a student to get through a school year on an outloy of $170. Recognizing that mining is not only an art, but a science also, the marked traits of practical self-trained engineers, "curiosity, clear-sightedness, and ingenuity," will be cultivated in students. In addition they will be given an efficient knowledge of mathematics and of the formulated laws of natural science. The course of instruction will be a just compromise between the formal scholastic training and the practical "shop" apprenticeship. "The attempt will be made not to develop consulting engineers, but rather the executive man of action in a scientific occupation."

The subjects taught will include algebra, geometry and trigonometry; chemistry, physics, mineralogy and geology; shop work, drafting, surveying, mining machinery and metal—and coal—mining. The two years' course will cover 80 weeks and there will be extra summer work. The school year will begin in January in order to include two summers. Two months each summer will be spent in underground work—one summer in metal mining and one in coal mining.

No mining theory will be taught the students until after the first summer's underground experience. A shaft will be started on the school campus, as a large body of zinc ore has been proved to exist there.

Laboratory instructing will be given in drilling.

Trans. of the Mining Institute of Scotland, Vol. xxx., Part I.—This pamphlet contains an abstract by James Bain of the report on Rescue Apparatus of a committee appointed by the Fife and Clackmannan Coal-owners' Association. That committee adopted the following conclusions: (1) That a central station equipped with a certain number of sets (say, twenty) of apparatus ready for use in case of emergency, is necessary for Fife, and that it should be in telephonic communication with every colliery. (2) That a certain number of sets of apparatus (say, not less than five) should be kept ready at every colliery. (3) That at every colliery at least twenty men, including all the officials who know the mine, should be instructed in the construction and use of the apparatus. (4) That an intelligent man should have care of the central station, and be capable of instructing the men in the use of the apparatus and keeping the apparatus in order. (5) That the apparatus designed by Mr. Garforth is the best suited for our mines, being lighter, smaller, and more flexible than any other inspected by the committee.

Developing each recommendation further, the committee estimates the cost of a central station, and experimental gallery, to be about £1,200, exclusive of apparatus, and that it would take from £250 to £300 per annum for upkeep. Each rescue party should consist of five persons, one to have charge of the other four, whose only duty would be to direct the operations. The committee further dwells upon a serious defect in all apparatus. Not one type provides for means of communication between the men forming the rescue party, except by signals.

PERSONAL AND GENERAL

Mr. Eugene Coste has returned from a visit to Ottawa and Montreal.

Mr. H. E. T. Haultain left Toronto on the 20th January for Craigmont.

Mr. J. J. Harpell has returned from a visit to Montreal, Ottawa and Kingston.

Mr. R. Anson-Cartwright has returned to Toronto after visiting Great Britain.

The Deputy Minister of Mines for Nova Scotia, Mr. Hiram Donkin, has been appointed Commissioner of Roads for the Province.

The task of presenting the petition for an extension of the bounty upon lead has been entrusted to Messrs. J. L. Retallack and L. Pratt.

Mr. S. H. Reynolds, C.E., assistant city engineer of Winnipeg, will remove to Victoria, B.C., and devote himself to mining engineering.

Mr. Howells Frechette, late of the Crow's Nest Pass Coal Company, passed through Toronto on the 20th of January on his way to Ottawa.

Mr. W. A. Carlyle, recently of the Rio Tinto, and now consulting engineer to Le Roi, passed through Toronto on his way to British Columbia on January 24th.

Mr. J. H. Plummer, president of the Dominion Iron and Steel Company, sailed recently from New York for England. He will be absent for about six months.

Mr. E. A. C. Pew, a prominent railroad and mining promoter, died in Toronto on January 16th, aged 73 years. He was largely interested in the iron mining industry.

Mr. E. J. Laschinger, M.E., B.A.Sc., formerly of Toronto, read a paper on the "Flow of Compressed Air in Pipes" before the Transvaal Institute of Mechanical Engineers, Johannesburg, on December 14th.

Mr. Anthony Blum, president of the Laurentian gold mine, Manitou Lake district, Ontario, visited the property recently, returning with a gold brick valued at about $6,000, the results of a month's clean-up. The name of the company has been changed to the Imperial.

Mr. H. Mortimer-Lamb, Secretary of the Canadian Mining Institute, visited Toronto early in January. Mr. Lamb has had several interviews with the Provincial and Federal Governments recently concerning the expected summer visit of the British Iron and Steel Institute.

Mr. R. H. Stewart, manager of the mines of the Consolidated Mining & Smelting Company, was married on December 26th to Miss A. A. Will, of Toronto. Mr. Stewart is a graduate of McGill, Mrs. Stewart a graduate of Victoria. The wedding took place in Victoria Chapel.

On Wednesday, January 15th, a Western Branch of the Canadian Mining Institute was organized in Nelson, B.C. Mr. Frederick Keffer, of Greenwood, who is president of the parent society, occupied the chair, and Mr. A. H. Gracey, of the Eva mine, acted as secretary. In all twenty-four members were present. There were also present others who will be added to the membership in due course. After Mr. Keffer had briefly outlined the objects of the new branch, a formal motion was made by Mr. S. S. Fowler, seconded by Mr. C. P. Hill, that "we now constitute ourselves a Western branch of the Canadian Mining Institute." This was carried unanimously. The following officers were then elected:—President, Mr. A. B. Hodges; secretary, Mr. E. Jacobs; executive council, Messrs. P. S. Couldrey, R. H. Stewart, L. Hill, O. E. S. Whiteside, W. M. Brewer, J. C. Haas, E. C. Musgrave, J. McEvoy and S. G. Blaylock.

President Hodges in his opening address stated that the whole reason for the formation of the Western branch is that the busy members of the West cannot attend the meetings of the Institute held in the East. He recommended that a committee of three be appointed to look into the by-laws of the Canadian Mining Institute. Accordingly, Messrs.S. S. Fowler, L. Hill and J. C. Haas were appointed and instructed to report on the morrow. Mr. E. Jacobs, editor of the "B. C. Mining Record," thanked the members for electing him to the position of secretary. He added that the Western branch had now almost 150 members, and that it would shortly attain a membership of 200.

Mr. Jacobs then remarked: "In view of the fact that the Department of Mines is now organized, it would be politic for us to draft a resolution congratulating the Dominion Government upon its establishment and expressing appreciation of the useful work done in the West by the Geological Survey and, as well, with reference to the statistics gathered by R. R. Hedley throughout the province." Mr. Jacobs also called attention to the fact that it had been said that the Canadian mint could not use Canadian metal for its work, inasmuch as there was no refinery for certain metals within the Dominion. This was not the case, inasmuch as there was such a refinery at Trail. This matter should be taken up by the Institute.

The secretary was instructed to prepare a resolution along these line.

The meeting then adjourned.

Mr. S. S. Fowler, on behalf of the Nelson members, tendered an invitation to the members to be present at a dance in the Hume Hotel.

Mr. Frank B. Smith has been commissioned as Inspector of Mines for the Dominion to look after the royalties on coal lands sold in Saskatchewan and Alberta.

CORRESPONDENCE.

WESTERN BRANCH OF THE CANADIAN MINING INSTITUTE.

Victoria, B.C.,

The Editor, January 18th, 1908.

Canadian Mining Journal.

Dear Sir,—Accompanying this I send you an account of the first meeting of members of this branch of the Canadian Mining Institute. Although the attendance was not as large as had been hoped for, it was considered good by those who made the arrangements for the meeting, having been representative of the chief lode—and coal—mining sections of British Columbia to a degree regarded as satisfactory, especially when it was taken into account the long distances most members reside from a convenient central point, and the difficulty busy officials usually experience in leaving their posts for four or five days at a time. Interest in the proceedings was general among members present, and was well maintained throughout the several sessions held. It is known that one immediate result was the nomination for membership in the Institute of at least a dozen other men actively associated with mining or smelting in the Northwest, while there was expressed by the leading members of the branch a determination to increase the total number of Western members of the Institute—now about 125—to fully 200 within a few months. With so comparatively numerous a membership, and the fact that it is both influential and representative, together with the active following up of the movement so successfully inaugurated at Nelson on the 15th inst., there does not seem to be room for doubt that eventually this auxiliary organization, launched under distinctly auspicious circumstances, will prove materially beneficial to the mining and smelting industries of Western Canada, and, it is hoped, in some measure also of those of adjacent parts. Your valuable co-operation is therefore earnestly invited.

Thanking you in advance, I am

Yours very truly,

E. Jacobs,

Secretary of Western Branch

One of the unnecessary burdens under which English companies, operating Canadian mines, have almost always suffered is that of costly administration. In the annual report of Le Roi Mining Company, Limited, we notice that a clerical staff is maintained in London, Eng., at an annual cost of $10,000. This is a wasteful duplication. Almost all necessary clerical work can be and should be done at the mine. The company's affairs in England might easily be handled at one-quarter of this outlay.

SPECIAL CORRESPONDENCE

ONTARIO.

COBALT.

Rochester, Cobalt.—Active work on this property will be resumed at once.

Provincial.—Twenty-five men are employed. A station is being cut at the 125 foot level.

Badger.—There are two shifts working here with three drills. Sinking on the No. 2 vein is being carried on.

Amalgamated Cobalt.—Work has been resumed on the lot of this company, adjoining the Trethewey on the west.

Nova Scotia.—Fifty-five men are employed. A car of very high grade ore has been shipped this month. No 2 shaft is now down 110 feet.

Cobalt Merchants' Mining & Milling Company.—At the annual meeting held in Toronto on Saturday, 18th inst., it was decided to wind up the affairs of the company.

Silver Queen.—There are nearly four cars of high grade ore ready for shipment. Work is still going on with the diamond drill. Twenty-five men are employed.

Cobalt Lake.—The big niccolite vein which was cut at 87 feet is now showing good silver values. At the surface this vein was practically solid niccolite, at 87 feet it is cobalt, niccolite and silver.

Northland Mine, Rib Lake (Harris Mine).—Forty men are at work here, and about two cars of ore per day are being shipped. Sinking will be resumed as soon as the new twelve drill compressor is installed.

Temiskaming & Hudson Bay.—The last two cars of ore from here were shipped to Copper Cliff. They brought $70,000, or an average of about $1,000 per ton. The cross cut being run north to the big cobalt vein has cut two small seams of smaltite. The cut is now in 125 feet.

Hudson Bay Extended.—On Saturday, 18th January, it was decided at the shareholders' meeting of this company to exchange the outstanding stock for that in the Cleveland Cobalt, on a basis of one share of H. B. Extended for six shares of Cleveland Cobalt. This will entail an exchange of 300,000 shares in the Cleveland Cobalt.

City of Cobalt.—The shaft on the City of Cobalt Mine is now down 145 feet. The vein, which was one and a half inches wide at the surface, was two and a half inches at 60 feet, and is now from 4 to 5 inches wide at the bottom of the shaft and averages 3,500 to 4,000 ounces silver to the ton. In sinking the 61 feet from the 80 foot level to the bottom 23,000 pounds of No. 1 selected ore, 33,000 pounds of cobbings and 70,000 pounds of screenings were produced. The No. 1 averages 3,500 ounces of silver to the ton, the cobbings 550 ounces, and the screenings over 275 ounces. It is estimated that close to 60,000 ounces of silver have been produced in 61 feet of sinking.

Cobalt Central.—The concentrating mill here is giving very satisfactory results. The mill report for one day in January shows: Tonnage crushed, 50 tons; mill heads, 71.1 ounces; mill tails, 4.6 ounces; extraction, 83.6 per cent.; jig concentrates produced, 315 pounds; table concentrates produced, 291 pounds; ounces silver recovered, 3,355; market value, $1,845.25. The mill is recovering 93 per cent. of the metal values.

The order constituting the Townships of Coleman, Bucke, Lorrain and Hudson "complete inspection areas" has been repealed so far as Coleman is concerned by Order-in-Council. The effect is that Section 68, Mines Act, 1906, no longer applies to Coleman Township, and inspection of claims is no longer required to obtain patents. Sixty days after recording, a certificate of record is issued, and after the work is done a patent is issued, (Section 160 (3) Mines Act, 1906). A licensee who has staked out a claim under the provisions of this Act shall, during each of the three years following the expiration of the three months from the record by or on behalf of such licensee of the staking thereof, perform thereon work, as in the first sub-section hereof, provided as follows:—

(a) During each of the first and second of such three years to the extent of not less than eight hours per day for sixty days.

(b) During the third of such three years' work thereon to the extent of not less than eight hours per day for ninety days.

The shipments from the Cobalt camp for the week ending January 11th were the largest so far for any one week in the history of the camp.

	Lbs.
Coniagas	77,020
Nipissing	131,730
La Rose	85,400
Nova Scotia	40,790

There were 39 companies organized in the eighteen months ending January 1, 1908, with a capital of $38,740,000, to do business in the Northern Ontario mining field.

COPPER CLIFF.

At both the Creighton and Crean Hill mines of the Canadian Copper Company new rock houses are being built. Each rock house has a capacity of 1,500 tons per day. The old rock house at the Creighton has been remodelled and rebuilt. At both mines new electric hoists have been installed, along with electric driven air compressors and pumps. The new engine houses, warehouses and shop buildings are all of fireproof construction.

During the past year an average of 1,000 tons of ore was mined. At the smelter three furnaces were operated all the year except during December, when only two were in blast. Two new furnaces have been purchased and delivered. They will be erected next summer. During the past year a new ten-stand converting plant of the best and most modern type was erected. A new six-stall round house has been added to the plant, and the foundations of new warehouses and shops have been started.

ALBERTA.

FRANK.

The Lille and Bellevue mines are also suffering from bad trade, about 250 miners being affected at these mines.

The Hillcrest mines at Hillcrest, near Frank, are in operation as they have a contract with the C. P. R. for the total output of the mines, and have an arrangement whereby they are allowed to dump the coal on the railway company dump if cars cannot be had. The International Coal & Coke Company of Coleman have a contract with the C. P. R. for a large part of the output and this company's mines are running full time.

Owing to the contract between the Canadian Pacific Railway Company and the Canadian-American Coal & Coke Company of Frank having run out about 250 men are out of employment. Mr. S. Moore, the general manager of the Canadian-American Coal & Coke Company, has asked an advance in price from the C. P. R., and the latter company decline to renew their contract for 800 tons per day unless at the old price. The C. P. R. claim that they are blocked up with coal in all their dumps.

TABER.

The mines round Taber are working very short time, owing to dullness in the coal trade. This has been anexceedingly mild winter, and as the Taber coal is only used for domestic purposes, the demand has not come up to expectations.

The following advertisement appeared in a recent issue of the Fernie *Ledger*:—

"WANTED."

"Employment for 938 miners, mine laborers, drivers, timbermen, hoistmen and engineers, now idle, warranted to be first-class wage slaves.

"Apply F. H. Sherman, Pres. U. M. W. of A., Box 145, Taber, Alta."

F. H. Sherman, president of District 18, United Mineworkers of America, has been in the Edmonton district during the past week settling some labor troubles at the mines. He has now gone to Indianapolis to attend the general convention of the United Mineworkers of America which is being held. The chief item of interest at the convention is the election of a new president to succeed John Mitchell, who has been in poor health for some time past.

It is generally understood that T. H. Lewis will be the member selected to fill the office of president on the retirement of John Mitchell.

EDMONTON.

As a result of a conference between representatives of the miners and mine owners of the Edmonton district a new wage scale has been agreed upon. The new scale was drawn up after a lengthy conference between T. B. Smith, representing the mine ownrs, and F. H. Sherman, of Taber, president of Dist. 18 U. M. W. of A. Dr. McNabb, of Lethbridge, representing the Lethbridge district, E. A. James, of Edmonton, local organizer of the northern district, and Chas. Richardson, president of the local union, all of whom represented the miners.

BRITISH COLUMBIA.

THE KOOTENAYS.

Work at the Granby mines and smelter in the Boundary district is now well under way. At the first of the year but two of the entire battery of eight furnaces at the smelter were operating, and only 250 of the regular force of about 550 men had been put to work at the mines. The output has been gradually increased, and more men put back to work until at this writing nearly 450 men are working at the mines and six of the big furnaces are treating ore. During the week ended January 11th the Granby shipped 12,887 tons of ore and treated at the smelter 15,695 tons. These figures should be much higher for the present week, as the output is being steadily increased. It is the intention of the management to increase the force until the smelter is running at its full capacity of 3,500 tons of ore per day, which will of course necessitate the mines turning out the greater part of this. If it is possible to keep this output up well into the middle of the summer and the affairs of the company look propitious, they will increase the capacity of the smelting plant to a treating capacity of 4,500 tons per day; at least, that is the intention now. The Granby Company's freight bill with the C. P. R. and G. N. R. when running at full capacity, amounts to about $30,000 per month. The British Columbia Copper Company pays the C. P. R. about $10,000 per month.

The British Columbia Copper, Snowshoe or Dominion Copper Company's mines have not made a move to resume work as yet, but it is expected that the coming month will see some developments at those properties. The Dominion Copper Company will hold their annual meeting at Phoenix on the 27th inst., when it is expected that something definite will be done.

With copper selling at its present low price, the Boundary mining companies will have to exercise great economy and good management if the shareholders are to get any dividends. During their last fiscal year it cost the Granby Company 10.13 cents to mine, smelt, refine and sell its copper. British Columbia Copper Company figures ran 12 cents to 12 1-2 cents as cost of mining, smelting, refining and selling its copper product. Dominion Copper Company produced copper at around 10 1-2 cents per pound, f.o.b. its smelter, but during the year ended July 31st last, owing to many drawbacks, it cost them approximately 14 cents.

The labor situation in the Boundary is in a fairly settled condition. There are a number of the men going around with a chip on their shoulder and grumbling at anything and everything, but the majority are not paying much attention to them and are glad to be back at work and doing their little share to tide matters over the present situation by working at a slightly lowered wage. There are two or three men for every position though, having hurried from all points of the compass when they heard that work was to be started up in the Boundary.

The Rossland mines are working a good force of men and good and busy. The Centre Star is shipping 3,700 to 3,800 tons of ore per week, Le Roi from 1,700 to 2,000 tons, Le Roi 2, Limited, about 600 tons.

The Le Roi 2, Limited, Company intends to mine and ship on a larger scale next summer. Considerable development work has been done lately looking towards this, and the showings seem to warrant the expenditure which will be necessary. The Le Roi 2 has always been a money-maker and dividend-payer, and interested people here will be pleased to see that they are planning for operation on a greater scale.

The Rossland Board of Trade is taking a keen interest in the extension of the lead bounty for another five years, and the raising of the limit when the bounty should be paid from $16 to $18. It is noted that the two and a half millions appropriated by the Government for the lead bounty, at the rate of $50,000 per year, only $616,976.02 has been paid to the lead producers. Still, there is no doubt that this bounty has been a wonderful stimulus to the silver-lead mines. This can be easily seen by the increased activity among the smaller silver-lead producers in the Slocan and East Kootenay during the period of its existence. Many of these lesser properties have been worked, developed and have made small shipments that would probably have lain idle had it not been for the bounty.

Residents of this locality take more or less pride from the fact that we are in a position to furnish the new Canadian mint with fine silver and gold for coinage purposes. The Consolidated smelter and refinery at Trail is one of the most up-to-date and complete plants in the country and is in a position to furnish more fine gold and silver than the mint can at present use. The material in the new coins will therefore be mined, smelted, refined and coined in Canada.

Many holders of stock in the East will be pleased to learn that they have made a valuable strike in the shaft at the 500 foot level of the Stemwinder mine. This makes the proposition look a whole lot better. Plans for energetic development work in the future are now being laid out.

The Diamond Vale Coal Company in Nicola valley have finally struck a six foot seam of coal on their property. As near as can be ascertained from the workings in the Valley Coal & Coke Company a very rich seam of fine coal exists 120 feet below the one struck. It is the intention of the Diamond Vale people to sink to this rich seam.

It is expected that the plant of the Nelson Electric Smelting Company for the handling of zinc ore will be in operation in the latter part of March or early in April. The Hewitt Mining Company in the Slocan are working actively and have drawn up plans

for another tramway, which will enable them to handle the product of the mine more economically.

Mr. M. S. Davys, of Nelson, and others, are negotiating for a lease on the Silver King mine at Nelson. The deal has not been put through yet.

The Vancouver mine, controlled by Le Roi 2, Limited, Rossland, and the Eureka (Consolidated) are working right along and are improving with every round fired.

The operators of the Krao mine find it a very expensive proposition to work their property with the present workings on account of the water they have to contend with. A 4,000 foot tunnel is planned, something similar to that driven a while ago by the Rambler-Cariboo, to overcome this difficulty.

A strike of good steel galena has been made on the Aurora property opposite Moyie. This property is supposed to be on the St. Eugene lead, as well as the submarine workings of the Cambrian people, in the centre of Moyie Lake. It does seem that where there is such a magnificent showing as the St. Eugene has there should be other valuable mines.

The Perry Creek Hydraulic mine near Cranbrook has been sold to the Illinois Steel Company of Chicago for $900,000, the original owners retaining $100,000 interest in the mine.

Mr. D. C. Corbin, the Spokane capitalist, who controls nearly 10,000 acres of coal lands on the Crow's Nest, is putting plans into operation to tap them with a railway and work the measures. This will give the Crow's Nest district another producing coal property.

The coal mines of the Crow's Nest, International and Royal Companies are being operated daily. The properties of the Canadian-American Coal & Coke Company at Frank and those of the West Canadian Collieries at Lille have suspended work temporarily.

GENERAL MINING NEWS

NOVA SCOTIA.

HALIFAX.—The Hon. Robert Drummond, editor of the *Maritime Mining Record,* writes strongly on the decision of the Supreme Court of Nova Scotia in the Coal-Steel case. The vital clause 3 is taken as the text for a remarkably frank editorial, in which Mr. Drummond states that the specifications were here incorporated by the Coal Company for the express purpose of preventing the Steel Company from securing coal at $1.28 for any other than the direct needs of manufacturing iron and steel. The decision of the court is traversed point by point. Strong allusion is made to the fact that for every ton of cheap coal obtained by the Steel Company, the public must suffer by paying an enhanced price for domestic coal.

SPRINGHILL.—Manager Cowans of the Cumberland Coal & Railway Company, Springhill, has refused to meet the Conciliation Board or the representatives of the workmen. Mr. Cowans claims that there is nothing to arbitrate. However, the Board is meeting and has taken evidence in the "stone" question.

ANTIGONISH.—Hugh Fletcher, of the Geological Survey of Canada, is investigating the recently discovered coal deposits at Big Marsh. Diamond drills are being used. Deputy Inspector of Mines Blackwood is associated with Mr. Fletcher.

WESTVILLE.—The fire clay and firebrick plant of the Drummond Colliery had a prosperous year in 1907. Their market is largely in Sydney and Sydney Mines with the two steel companies. For ladle linings their product is unsurpassed.

The Drummond colliery exceeded all previous annual records.

SYDNEY.—The Dominion Iron & Steel Company is reported to have struck a large seam of coal on the Cowan's areas. Thirty men are working on these areas.

ONTARIO.

OTTAWA.—The Railway Committee of the House of Commons discussed the building of a branch of the British Yukon Railway Company to the valuable copper deposits of the Takhiena River district. The branch is to be commenced within two years and completed within five years of the passing of an Act authorizing the company to build it. It will be 25 miles in length.

TORONTO.—The shareholders of Peterson Lake at a special meeting held on January 22nd refused to approve the proposal of the directors to sell thirty acres of their property to the Nova Scotia Cobalt Mining Company for 150,000 fully paid shares in the latter company. The proposal to elase ten acres on the west side of the lake to the Little Nipissing Mining Company was unanimously adopted. The Little Nipissing people thus secure ten acres for five years on condition that they do all the development and pay the Peterson Lake Company 25 per cent. of the receipts from ore sales.

Frank Law was fined $200 on Monday, January 21st, by Magistrate Kingsford. The charge laid was that Law as president of Law & Company, and as an officer of the notorious Highland Mary Mining Company, Limited, had committed a breach of the Companies' Act in issuing false prospectuses.

COBALT.—In the Foster mine vein No. 8 has been struck at the 140 foot level. Good results were obtained from this vein on the 70 foot level.

During 1907 Nipissing shipped a total of 2,406 tons of ore, valued at $1,375,000 gorss. Ore blocked out, ready for mining, on January 1st, 1908, has an estimated gross value of $1,057,000.

Silver nuggets totalling more than one hundred pounds in weight were stolen on January 21st from the King Edward mine. It is reported that a reward of $1,000 is offered for information leading to the apprehension of the thieves.

PORT ARTHUR.—J. S. Steele, manager of the St. Anthony's Reef gold mine, on January 20th deposited in the vaults of the Port Arthur branch of the Bank of Montreal several gold bricks. These were the result of a clean-up at the St. Anthony mill. Firty-five miners are employed at the mine and the mill is running regularly.

Major J. K. Harley, of London, Eng., is reported to have organized a company for the purchase of a large block of iron ore areas at Loon Lake and Beck Siding.

COBALT.—The shipments of ore from the Cobalt camp for the week ending January 4th amounted to 204,420 pounds, as follows:—

La Rose	104,910
Nipissing	54,410
Townsite	45,100

SAULT STE. MARIE.—The "Soo" steel plant is closed, the blast furnaces will be kept in operation.

ALBERTA.

EDMONTON.—As a result of friction between the C. P. R. and the operators the Frank, Bellevue and Hillcrest coal mines are closed, together with a number of smaller mines. About 1,100 miners are out of work. Low prices are the cause of the trouble.

BRITISH COLUMBIA.

GOLDEN.—A small experimental mill has been erected near Golden for working the Elmore Vacuum Oil Process of ore concentration. The mill has a capacity of 40 tons per day. Five years ago the old Elmore process was tried without success at Le Roi No. 2 and White Bear.

NELSON.—The power and milling equipment of the Blue Bell mine, on Kootenay Lake, is now complete. A 200 ton mill has been built and water has been flumed for several miles. The mine is a lead and zinc producer. Upon the completion of the new zinc reduction plant at Nelson, shipments will be made there by the Blue Bell.

The old Hall Creek Placer Mine, 10 miles south of Nelson, on the Spokane Falls and Northern Railway, is to be reopened on a large scale. The gravel has given 20 to 26 cents per cubic yard. For the last ten years Chinamen have worked the ground.

PHOENIX.—For the week ending January 11th the Granby Company's mines were the only shippers from the Boundary district. These mines shipped 12,887 tons of ore and treated 15,695 tons at the smelter. It is hoped that 20,000 tons will be shipped during the ensuing week.

The enlargement of the lead plant of the Consolidated Mining & Smelting Company will make the further shipment of lead concentrates to Europe unnecessary.

The Nicola Valley Coal & Coke Company shipped 3,593 tons of coal during December. The company employ 130 men.

The Vancouver and Hewitt mines of Silverton shipped eight car loads of ore during the week ending January 11th.

The Granby mines and smelter are in normal working condition. Six furnaces are in blast and 2,500 tons of ore per day are being produced at the mines, where nearly 500 men are employed.

VICTORIA.—The Eastern British Columbia Railway Company is applying for permission to build a railway from Crow's Nest Pass to Eastern Kootenay. If it succeeds it will operate some of its 10,000 acre of coal lands in the last named district.

The Pacific Slate Company of Victoria owns and controls an area of 625 acres of slate-bearing lands. The first shipment from the newly opened quarries arrived recently in Victoria. The quantity shipped was 17,000 square feet. The slate is of superior quality. The property is situated on Jervis Inlet, 80 miles north of Victoria.

SILVERTON.—The week ending January 4th saw the largest shipments ever made from this camp. Eight car loads of ore were shipped to the smelters.

ROSSLAND.—Development has been pushed half way into the Idaho from the fourth level of the Centre Star. On the fifth level the ore body in the Idaho has been cut by a diamond drill hole, and the fifth level is being extended towards the ore. A shaft have been extended down to the fourth level. On the 150 foot level drifts are being extended both ways in good ore. The eleventh level of the Centre Star has been extended into the Idaho, and has resulted in the opening up of an ore body 35 feet wide near the Centre Star end line.

Several stopes on the Centre Star's eleventh level have turned out unexpectedly large. On the thirteenth and fourteenth levels development has been in progress long enough to demonstrate that the vein more than maintains its size at depth, having a width when crosscut on the fourteenth level of 65 feet. Ore stoped from here has run well up to the mine average. Face samples running to a value of $40 to the ton have been obtained. This is at a depth of 1,900 feet.

In the lower levels of the War Eagle individual samples as high as $200 to the ton are not uncommon, and a recent shipment of 100 tons ran $50 per ton in gold alone. This ore is a heavy sulphide. It is worthy of note in this connection that ore from the twelfth level carries copper values considerably above the average.

In the Iron Mask four veins intersect at one point. At the intersection on the fourth level a large ore body is being opened up. The vertical dimensions of the ore are not yet definitely known. One vein that was worthless when the mine was held by former owners, now yields a good profit under present conditions of cheaper mining and treatment costs.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

The Royal Commission on Mines has appointed a committee consisting of Prof. Redmayne of Birmingham University, A. M. Lamb, mining engineer, and W. Walker, Inspector of Mines, to visit a number of representative collieries and report as to the causes of and means to prevent accidents from falls of rock and side and underground haulage.

A notable feature of the coal trade during 1907 was the continued expansion of the export trade. Final returns are not yet available, but in the eleven months ended with November there had been an increase in export of about 7,500,000 tons over 1906, following an increase for the latter year over 1905 of 8,500,000 tons. Sales to Germany increased by 3,500,000 tons, and increased trade was done with nearly every European country.

A serious strike has broken out at the Nottinghamshire coal pits of Barber, Walker & Company, involving 3,000 employees. The men declined to accept a wage scale based on existing prices.

A discovery of gold-bearing rocks has been made at Henllys near Newport, on the Welsh border. A mining expert obtained permission to have the rocks crushed and assayed and they were found to be rich in gold. Gold exists in many places in the United Kingdom, but usually in minute quantities. There are only four producing mines in existence, and the total value of the gold mined in 20 years is £345,645.

RUSSIA.

Near Hagri, in the Caucasus, an abundant deposit of asphalt has been discovered, and a company formed to work it. A large factory is being built in the Zhockari valley, where asphalt will be prepared both for home consumption and export.

The Kamchatka peninsula is attracting the attention of gold miners. Reef gold has been discovered near Petropavlovsk, where prospecting has proved the occurrence of a quantity of gold at a shallow depth.

AUSTRIA-HUNGARY.

A company has been formed at Prague with a capital of 500,000 crowns to develop the coal fields belonging to Oberfinanzrath Kress at Hotomitz, near Dux, Bohemia.

BULGARIA.

The mining industry is being gradually developed with the aid of foreign capital, a number of British capitalists and mining experts having made exhaustive researches in this field. A British company has obtained a concession for working a copper mine at Belogradchik. Copper is also to be found at Vratza and near the Black Sea port of Bowigas. Concessions have been granted by the government for coal, iron, lead and zinc mines in various localities.

CHINA.

A Chinese company has been organized with a capital of $2,000,000 to open iron and coal mines near Awtow, 55 miles northwest of Tsuantsiu. English engineers have charge of the development work and of the construction of 50 miles of railroad in connection with the mines.

UNITED STATES.

The following figures showing the mineral and metallic production of the United States for 1907 are published by the *Engineering and Mining Journal* as being a close approximation to the actual output, a portion of the returns for December being based on estimates.

Non-metallic.—Coal, bituminous, short tons, 383,480,080; value, $441,949,931; changes in quantity, I. 41,850,957. Coal, anthracite, short tons, 85,063,264; value, $159,942,986; changes in quantity, I. 12,853,698. Garnet, short tons, 6,500; value, $216,125; changes in quantity, I. 1,096. Iron ore, long tons, 52,418,755; value $110,079,385; changes in quantity, I. 3,201,266. Limestone flux, long tones, 14,925,000; value, $10,447,500; changes in quantity, I. 373,000. Petroleum, barrels, 165,788,906; value, $118,408,409; changes in quantity, I. 34,106,401. Phosphate rock, long tons, 1,917,000; value, 13,419,000; changes in quantity, D. 135.742.

Manufactured.—Bromine, pounds, 1,062,000; value, $138,060; changes in quantity, D. 167,000. Coke, short stons, 40,090,670; value, $106,757,970; I. 7,400,308. Copper sulphate, pounds, 40,138,117; value, $2,733,405; changes in quantity, D. 10,787,815. Copperas, short tons, 25,212; value, $262,120; changes in quantity, I. 4,373. Graphite, artificial, pounds, $6,924,000; value, 483,717; changes in quantity, I. 2,056,000. Lead, sublimed white, short tons, 8,700; value, $1,026,600; changes in quantity, I. 712. Zinc oxide, short tons, 83,280; value, $7,516,360; changes in quantity, I. 5,480.

Metallic.—Aluminum, pounds, 25,000,000; value, $11,250,000; changes in quantity, I. 10,650,000. Copper, pounds, 895,104,000; value, $184,937,437; changes in quantity, D. 22,516,000. Gold, oz. fine, 4,335,560; value, 89,616,017; changes in quantity, D. 312,825. Iron, pig, long tons, 25,975,944; value, $892,251,523; changes in quantity, I. 668,753. Lead, short tons, 359,058; value, 38,239,677; changes in quantity, I. 13,529. Quicksilver, flasks, 19,900; value, $805,950; changes in quantity, D. 5,409. Silver, oz. fine, 56,925,911; value, $37,187,990; changes in quantity, I. 742,411. Zinc, short tons, 246,688; value, $29,415,077; changes in quantity, I. 21,194.

The zinc separating plant in operation at the Lexington mine of La France Copper Company, Butte, Montana, is declared to be completely successful and likely to prove of great advantage to the mines in the neighborhood which have on hand quantities of silver-zinc ore. This ore carries silver, gold, copper, lead, iron and zinc, but on account of the predominance of the latter metal the copper smelters have been unable to treat it except at a heavy loss. The new system which has been in operation in Texas for some years saves every metal in the ore.

MEXICO.

Oil in good quantities has been found in three wells drilled by W. R. Hearst and James Keene near Ojinaga in Eastern Chihuahua. One is down 4,000 and another 1,400 feet.

Miners throughout Mexico are being called on to accept reductions in wages of from 25 to 75 cents per day, the reasons assigned being the low price of metals and the increase in the supply of labor caused by the closing down of mines.

VENEZUELA.

President Castro has annulled the contract made by the government with the Venezuelan Salt Monopoly, Limited, an English corporation, signed in 1905, leasing certain salt mines and giving them a monopoly of the sale of salt for ten years.

AUSTRALASIA.

The Queensland Government announce that recent tests of coal from the Government mine on Dawson River have proved satisfactory, the indication being that it is a fuel similar to some of the American anthracites requiring a forced draught for its proper combustion.

A bulletin of the New Zealand Geological Survey gives a description of the large deposit of iron ore situated on the shores of Parapara Inlet, which has so far been left practically untouched. The ore occurs in three enormous blocks, the amount contained in the Washbourn block being estimated at 22,691,762 tons. In 34 samples taken from this block the average iron content was 51.79 per cent. The ore is mainly limonite, though partly gothite and possibly turgite, and phosphorus, sulphur and other impurities do not occur in serious quantities. The deposits are all in accessible localities.

SOUTH AFRICA.

The annual report of the Orange River Colony Mines Department for the year ending June 30th, 1907, states that there was a marked increase in the coal output. The total tonnage produced during the year was 499,590 tons, value £139,674, as against 263,232 tons for the previous year. Keen competition among coal operators in the Transvaal has resulted in price-cutting, which has reached against further development, but prices in the Transvaal have recently been raised by a combine.

Great activity has been shown lately by prospectors for diamonds in Orange River, especially in the neighborhoods of Boshof and Smaldeel. Though the number in the field was unprecedented, the Mines Department report for 1906-97 notes that no discovery of a payable mine was reported, though one or two finds may ultimately prove valuable.

The gold output of the Transvaal for November was 549,801 ounces, valued at £2,335,406, a slight decrease from the production for October.

COMPANY REPORTS.

COBALT TOWNSITE SILVER MINING COMPANY OF CANADA, LIMITED.

The first annual meeting of this company was held on December 30th at Salisbury House, London, E.C. Col. Sir A. C. F. Fitz-George presided. In his report he mentioned that the issued capital of the company is £185,007. One hundred and eighty thousand shares of £1 each are issued fully paid to the Canadian Company. The balance, £5,000, was subscribed in cash at par by the promoters. Five thousand six hundred pounds has been provided by the Canadian promoters in loans for working expenses. The English Company has also advanced £8,240. One hundred and seventeen tons of ore carrying 40,000 ounces of silver have been shipped. The mine is now self-supporting, althouyh funds may be needed if suitable arrangements cannot be made with smelters. The concentrating company, with whom the Townsite has entered into a contract, is expected to begin operations in January. Concentrating ore to the amount of 664 tons carrying about 20 ounces per ton is on the dumps.

Mr. A. J. Young, managing director of the Canadian Company, stated that $75,000 had been spent on the property. He outlined some of the difficulties overcome and spoke hopefully of the future.

LE ROI MINING COMPANY, LIMITED.

Notice of this, the eighth ordinary general meeting, held in London, Eng., on December 23rd, was crowded out of our last issue. Mr. T. D. Grinmke-Drayton, J. P., chairman of the company, presided, and in his address alluded to the fall in price of copper, to the shortage of fuel, and high cost of labor as having been instrumental in reducing profits. The Northport smelter had a continuous run of only four months. The Trail smelter was closed for a considerable time and was unable then to treat the ore contracted for from Le Roi. Wages and cost of all materials have increased during the year. Nevertheless more money was spent upon development work than for several years past. The main shaft has been sunk to the 1,650 foot level and development pushed on to the Black Bear claim, where the expectation of finding ore was realized.

The chairman, continuing, announced that the financial year is to end hereafter on September 30th and not on June 30th. This will give more value to the annual meeting. Referring to Mr. W. A. Carlyle's appointment as consulting engineer, the chairman said that Mr. Carlyle was chosen because a man was wanted who had had experience of the peculiarities of Rossland mines, who was not connected with any companies whose interests would clash with Le Roi's, and whose name and reputation would command the confidence of the shareholders and the public.

The managing director, Mr. A. J. McMillan, referred at length to the difficulties and hindrances by which the management had been hampered during the past year. A falling off in value of the ore at the rate of nearly $2 per ton, making a total loss for the year of about $250,000, made a dividend payment undesirable. However, late vigorous development gave assurance of better ore for the ensuing year. Upon the sinking of the main shaft from the 1,350 to the 1,650 foot level £11,000 was expended. No benefit was derived from this until after June 30th, the end of the financial year. Large shipments made to the Trail smelter under contract, when copper was at a low mark, prevented the company from getting the benefit of the subsequent rise. On June 30th, 1907, the company had in transit and on hand nearly 900,000 pounds of copper, the whole of which was seriously affected by a fall in price. The depreciation amounts to over $34,000. Although profoundly affected by the fall in price of copper, the company was not hurt by the fall in silver and lead.

Mr. McMillan alluded, in closing, to the cheerful prospects held out for the company year. He predicted a rise in price of copper and mentioned that a substantial reduction in wages had been recently accepted by the company's employees. He congratulated the company upon the appointment of Mr. Carlyle.

Discussion elicited the facts that the smelting costs per ton were $10.02 on 131,000 tons of ore, and that there was a reduction at the refinery for losses in dealing with the matter. Mr. G. W. Wilson, a retiring director, was unanimously re-elected to the Board.

It is worthy of note that the company maintains a clerical staff in London at an annual cost of $10,000. This was the subject of some comment.

COMPANY NOTES.

The annual meeting of the Royal Victoria Mining Company was held at Greenwood on January 27th.

It is announced that a dividend of 3 per cent. will be paid on the new Temiskaming stock on February 15th next.

The International Coal & Coke Company, Limited, will, on February 1st, 1908, pay a dividend of two per cent. on its issued and outstanding stock.

The annual meeting of the Dominion Copper Company was held on Monday, January 27th, at the company's registered British Columbia office in Phoenix.

The annual meeting of shareholders in the Silbert Consolidated Mines, called January 22nd, was postponed until February 8th at the King Edward Hotel, Toronto.

Fernie. The Crow's Pass Coal Company paid out in wages on Saturday about $200,000. The Home Bank will distribute the money at Coal Creek, Fernie and Michel.

A check has been received from the O'Brien mine by the Provincial Treasurer for $7,327.75, the 2½ per cent. royalty on the mine output for the month of December.

The Dominion Coal Company has declared a dividend on its preferred shares, payable February 1st, 1908. This is the half yearly dividend of three and one-half per cent.

The Northern Exploration Company, of which Col. A. M. Hay is president, has declared another 10 per cent. dividend, payable January 31st. This makes a total dividend payment of 20 per cent. for the year ending January 31st, 1908.

The financial statement of the Stemwinder Gold & Coal Mining Company, Limited, of British Columbia, shows that the total capital stock now issued amounts to $666,707.75, on which $68,170.56 still remains to be paid. The company's gross available funds are given as $75,301.56. After making certain necessary deductions, there remain $62,450.15 in cash available for work, machinery, etc. For the year the operating expenses amounted to $64,535.39.

In a circular dated January 20th, the Nipissing directors make the following announcement: The following is a brief financial statement of the affairs of the Nipissing Mining Company, Limited (the operating company) as of January 1, 1908:

Cash in bank and bullion on hand	$387,458.00
Ore in transit and at smelters	337,400.00
Ore sacked at mine ready for shipment..	163,542.00
	$888,400.00

At the annual general meeting of the shareholders of the Diamond Vale Coal & Iron Mines, Limited, held on Wednesday, January 15th, a satisfactory report was read. Before the end of the current year it is expected that a daily output of 500 tons will be reached. There is evidence that the entire 2,067 acres held by the company is underlaid with coal. About $50,000 has been spent on development. A complete surface equipment has been installed, and regular shipments of high grade coal have been commenced. The present output is but 25 tons per day in excess of the company's own requirements. Additional working faces will one by one add 20 tons each to the daily output until the maximum capacity is reached.

The annual report of the Northern Securities Company shows that the company during 1907 acquired by subscription 2,067 additional Crow's Nest Pass Coal Company shares. The aggregate holdings of these shares by the Securities Company are valued in the statement at $3,741,122, the increase in this item for the year being $516,750. The company, since its distribution of its former holdings of Northern Pacific and Great Northern shares, holds $2,858,594 of Chicago, Burlington & Quincy shares, and less than a thousand dollars of N. P., G. N. and C., B. & Q. joint bonds. The company received on its Crow's Nest Pass stock $150,841 in dividends. The net dividend income of the Securities Company was $330,000, and, after the payment of the 5 per cent. dividend, the balance of income was applied on the payment of securities acquired during the year.

STATISTICS AND RETURNS.

NOVA SCOTIA COAL SHIPMENTS.

Intercolonial Coal Company—Monthly shipments:—

	1906.	1907.	Changes.
January	24,310	23,734	d 576

—From the *Maritime Mining Record.*

BRIITISH COLUMBIA SHIPMENTS.

The shipments for the week ending Saturday, 11th January, were light, but this is entirely due to the Boundary. The shipments from Rossland and from the Slocan are above the average and one or two new properties are to be seen upon the list. The shipments from the Boundary section are merely light because of the inability to start at once so large a property as the Granby running in full swing within a few weeks. Within a few weeks the output should be at least up to normal conditions.

Followings are shipments, up to date for the beginning of the year:—

Boundary Shipments.—Week, 12,887; year, 12,887.

Rossland Shipments.—Week, 6,018; year, 11,572.

Slocan-Kootenay Shipments.—Week, 3,216; year, 5,081.

The total shipments for the past week were 22,121 tons, and for the year to date 29,540 tons.

There was a noticeable increase in the amount of ore shipped to the Granby smelter during the week ending January 18th, although the amount is not as yet up to the normal tonnage of the property. On the other hand, the smelter is treating rather more than the ore received, the total tonnage for the week being 17,238 and for the year 32,953 tons, receipts from the mine during the same period being 29,246 tons.

There are a good many shipments this week from the mines of the district around Ymir, where considerable activity is now noteworthy. The Slocan is also well represented.

Following are the shipments, up to date for the beginning of the year:—

Boundary Shipments.—Weew, 16,359; year, 29,246.

Rossland Shipments.—Week, 5,381; year, 16,953.

Slocan-Kootenay Shipments.—Week, 2,944; year, 7,679.

The total shipments for the past week were 24,684 and for the year to date 53,869 tons.

The production of the British Columbia Copper Company for 1907 amounted to 8,119,502 pounds of copper.

The output of the Crow's Nest Pass Company's collieries for the week ending January 10th was 23,399 tons, or a daily average of 3,900 tons.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ending January 17th was 24,641 tons, or a daily average of 4,102 tons. For the corresponding week of last year the output was 17,230 tons, or a daily average of 2,871 tons.

The output of the Crow's Nest Pass collieries for the week ending January 24th was 20,705 tons, a daily average of 3,450 tons.

The general results of the operations of the Le Roi Mining Companyforthe past four years as set out in the subjoining table:—

Year.	Ore shipped. Tons.	Value. Ton.	Costs. Ton.	Profit. Ton.
1904	160,110	$10.94	$10.57	$9.37
1905	114,960	12.41	10.08	2.33
1906	110,042	12.37	10.50	1.87
1907	131,696	10.49	10.02	0.47

Following are the shipments from Cobalt camp for the week ended January 18th:—

	Pounds.
Buffalo	63,000
La Rose	296,000
Nipissing	64,540
O'Brien	120,200
Kerr Lake	39,980
Watts	64,780

The total shipments for the week were 648,590 pounds, or 324 tons.

The total shipments for the year 1907 were 28,010 pounds, or 14,010 tons.

Considering the amount of time lost by miners during the month of December, the output for the different collieries of the Nova Scotia Steel & C oal Company compare favorably with previous months. In all, 11,784 tons were raised, as follows:—

	Tons.
No. 1 colliery	18,560
No. 3 colliery	23,468
No. 5 colliery	6,868
No. 4 colliery	688

The total amount of coal mined from the collieries during the 12 months just ended was 638,065 tons, No. 3 colliery being the

biggest producer, with an output of 296,466 tons; No. 1, with 256,161; No. 5, 82,310 tons, and No. 4, 3,128.

Dominion Coal Company's outputs, 1st January to 15th January, 1908:—

	Tons.
No. 1	19,359
No. 2	26,273
No. 3	13,709
No. 4	19,187
No. 5	22,905
No. 6	9,555
No. 7	3,054
No. 8	5,703
No. 9	13,932
No. 10	4,596
Total	138,273

The copper production of the Granby Consolidated Company for 1907 was 15,514,000 pounds, a falling off of more than 2,000,000 pounds as compared with 1906. Shortage of coal and coke along with labor difficulties were the causes of this decline.

The ore production of the St. Eugene mine at Moyie for 1907 was 152,827 tons. Three hundred and twenty-five men were employed. St. Eugene is the second largest silver-lead mine on the continent. It is owned by the Consolidated Mining & Smelting Company of Canada.

Figures covering the output of gold in Rhodesia, South Africa, for the month of December place the total at 53,113 fine ounces, making the grand aggregate for the year 1907 612,452, a new high record. In November the total was 50,891 fine ounces, and in December a year ago was 48,329 fine ounces.

The following table gives the output of gold, by months, for a series of years:—

	1907. oz.	1906 oz.	1905. oz.
January	47,048	42,950	32,531
February	40,482	38,037	30,131
March	46,887	44,574	34,927
April	49,772	42,423	33,268
May	52,668	46,729	31,332
June	54,918	47,664	35,256
July	54,438	48,485	34,693
August	54,790	50,127	35,765
September	53,622	48,410	35,785
October	53,823	45,664	33,383
November	50,891	48,503	32,861
December	53,113	48,329	37,116
Total	612,452	551,895	407,043

During the year 1907 Nipissing shipped a total of 2,406 tons of ore containing silver of an estimated total gross value to the company of about $1,375,000. It is impossible, as yet, to figure accurately the value of the ore shipments, as a number of cars are still outsstanding.

In addition to the above shipments the Nipissing Company had on hand on December 3 ore of a gross value of $165,500, figuring silver at 53 cents an ounce.

At the beginning of the 1908 year the Nipissing Company had a tonnage of ore in the mine available for extraction of estimated gross value of $1,057,000.

The following is an estimate of the value of the ore shipped in each month of the year 1907:—

Month.	Tons.	Silver oz.	Approx. gross value.
January	271.8	176.603	.....
February	183.4	220,642	.....
March	285.0	91,124	.....
May	231.3	188,144	.....
June	337.2	287,407	.....
July	151.3	153,385	.....
August	420.5	302,324	.....
September	158.9	323,227*	$1,132,858
October	64.7	151,108	.....
November	118.6	32,397	.....
December	183.4	273,778**	242,360
Total	2,406.1	2,200,143	$1,375,218

* At 65c.

** At 53c.

Shipments from the Cobalt camp, December, 1907:—

Mine.	Tons of 2,000 lbs.
Buffalo	132.100
Coniagas	87.70
Drummond	28.55
Kerr Lake	52.75
King Edward	31.12
La Rose	130.22
McKinley-Darragh	561.28
Nancy Helen	30.10
Nipissing	189.37
Nova Scotia	120.00
O'Brien	29.95
Right of Way	62.10
Silver Leaf	24.60
Temiskaming	22.80
Temiskaming & H. B.	32.00
Trethewey	31.00
Total	1265.64

This was shipped as follows:—

Canada, 250.16 tons, or 19.77 per cent.

United States, 1015.48 tons, or 80.23 per cent.

For the first nine months of 1907 the Dominion Government paid in bounties to the iron and steel manufacturers of Canada $1,299,000, of which the Algoma Steel Company obtained $348,000, the Dominion Iron & Steel Company $699,000, the Nova Scotia Steel & Coal Company $93,000, and the Hamilton Steel & Iron Company $125,000. This bounty was paid on pig iron, puddled bars, steel ingots and manufactured steel.

The total bounties paid to manufacturers by the Dominion Government for the past few years are as follows:—

1906	$2,050,000
1905	1,540,000
1904	908,000
1903	1,401,000
1902	791,000
1901	467,000
1900	312,000

A new record was made at the plant of the Dominion Iron & Steel Company on Monday, January 6th, when in twenty-four hours the blast furnaces turned out 1,135 tons of pig iron. This is the best day's work yet done at the works. The previous week a record of 1,027 tons was made.

The production of gold at the Rand in December is officially announced at 583,526 fine ounces, valued at £2,478,659. The preliminary statement, which was sadly out, placed the production last month at 540,000 fine ounces. In December last year the output was 550,167, and in December, 1905, 431,594 fine ounces. The out-turn of gold at the Rand for the calendar year ended December 31st last aggregated 6,551,662 fine ounces, against 5,786,617 fine ounces in 1906, and 4,897,221 fine ounces in 1905.

The first estimate of Canada's gold production in 1907 shows a decrease as compared with 1906. The yield of gold from British Columbia was nearly a million dollars less than in 1906, and there was a further falling off in the Yukon. The placer mines at the end of the year, however, were in such a position as to indicate a larger output. During the current year than in 1907. Together the declines in the British Columbia and Yukon fields in 1907 represented a loss of two and one-half millions. The output in 1906 was $12,023,032. This year's production is $9,500,000, the decline being in exact figures $2,523,032, which is a little less than the decrease in the entire world's production. The output in the United States fell off by nearly six millions, and that of Australia by seven millions. Large gains were made in Africa. Although the T8ransvaal output was enormously increased since the Boer war, it is now receiving a setback. Monthly returns continue to reflect decreases, the output for December being ten thousand ounces below October. The value of the Transvaal December output was $11,475,000, compared with $11,677,000 in November, and $11,684,000 last December.

Crow's Nest Pass Coal Company, Fernie, B.C.—There is a very marked increase in the annual output of the collieries and coke ovens of this company. The total production might have been larger had the management been able to rely upon regular orders from the smelters. As has been mentiond before in these colunms, the increase of wages at the smelters in South Eastern British Columbia disturbed the balance of labor during the summer. The reduction of wages following hard on the heels of the fall in price of copper, was an inevitable consequence of an ill-advised step. Temporarily the higher wages paid at the smelters drew workmen from Fernie and left the Coal Company short handed. Yet the year's output is more than satisfactory.

1906—Coal, 806,901 tons; coke, 213,295 tons.

1907 (approximate—not including December)—Coal, 985,000 tons; Coke, 235,000 tons. Increase over 1906—Coal, 22 per cent.; Coke, 10 per cent.

When returns are complete the coal tonnage will exceed 1,000,000 tons and the coke, 250,000 tons.

The Crow's Nest Pass Coal Company will, during 1908, practically double its output.

INDUSTRIAL NOTES.

From the Christman Company, Massilon, Ohio, we have received a catalogue of their drilling machinery and mine equipment. Features of especial interest are their automatic switch and signal for use in coal mine tipples and at partings in mines, and their hollow rod tools for test drilling. The former device is labor-saving; the latter has one or two valuable improvements. Hollow rod tools are especially adapted for drilling test holes for coal, lead, zinc, placers, water wells, foundations and all work where continuous samples of successive strata are desired.

The Mashek Engineering Company has changed its location. It is now established in larger and better quarters at 141 Broadway, New York. The coal briquetting machinery rendered this change essential.

MARKET NOTES.

Silver.—January 2nd, 54 1-4; January 3rd, 55 1-8; January 4th, 55 5-8; January 6th, 55 7-8; January 7th, 58 3-8; January 8th, 57 1-8; January 9th, 56; January 10th, 54 3-4; January 11th, 55 1-4; January 13th, 56 3-8; January 14th, 55 7-8; January 15th, 55 5-8; January 16th, 56; January 17th, 55 3-8; January 18th, 55 1-2; January 20th, 55 5-8; January 21st, 55 1-2; January 22nd, 55 1-2. Sterling Exchange, January 22nd, $4.8675.

Copper.—January 22nd, New York, lake, 14 cents per pound; electrolytic, 13 3-4 per pound; London, standard £62 12s. for spot. Market steady. Fair business doing.

Lead.—New York, 3.75 per pound; London, £14 10s. for Spanish lead. Market steady and unchanged.

Tin.—New York, 28 cents per pound; London, £124 for spot.

The growing tendency to install tube mills as accessories of the stamp mill will have a strong bearing upon the gold industry of Canada, particularly that of Nova Scotia. Whilst the tube mill has not yet been standardized, different makers producing highly divergent types, yet several makes are efficient and economical. A study of the tube mill in its relation to South African gold milling induces the belief that several Nova Scotian gold mines could be revived if a well-designed equipment were installed. The designing and arrangement of overground equipment must meet the special requirements of each mine. The erection of standard stamp mills, ordered from the manufacturer's catalogue, is often a serious blunder.

Among the best gold miners of Canada are Nova Scotians who have worked in British Columbian camps and have had the added advantage of working the Nova Scotia lodes. Usually these men are expert hammersmen and can also handle a machine to great advantage. The Nova Scotian miner in fact is usually proficient in timbering also.

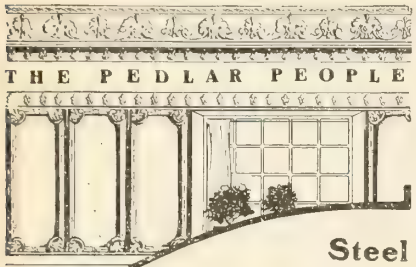
MINERALS
And How They Occur

A Book for Secondary Schools and Prospectors

BY



WILLET G. MILLER

Provincial Geologist of Ontario; formerly Professor of Geology in the School of Mining, Queen's University, Kingston, Canada

252 pages; price $1.00; post paid. Boards

Dr. Miller's text-book, now in its third edition, has undoubtedly met the requirements of prospectors and students. It is simple in diction, and logical in plan. It comprises exactly the information needed by the beginner and, because of its clearness and simplicity, it is distinctly of value to all classes of mining men.

"Minerals and How They Occur" can be obtained from the Canadian Mining Journal

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Mining Claims Wanted

Responsible London house is prepared to buy bona fide developed Copper, Nickel, Silver and Iron Properties. Three to six months option necessary. Payments cash and shares. Send particulars to

J. A. JOHNSTON, SUDBURY.

BRITISH COLUMBIA

Mechanical Engineer with small capital, several years' office and shops experience in Ontario and Kootenays, would join manufacturing or commercial engineering concern on Coast.

Address: J. C. T. CROFTS,
58 Howland Avenue,
TORONTO.

VANCOUVER

As Agent. Advertiser wishes to represent in Vancouver, B.C., a Firm or Firms manufacturing or supplying machinery of all kinds: 10 years experience in the business; 5 years in B.C. mining districts.

Address: J. C. T. CROFTS,
58 Howland Avenue,
TORONTO.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class - $80.00 to $500.00
2nd " - - 45.00 and 47.50
3rd " - - - - - 28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

Branches at COBALT and LATCHFORD, in the silver mining camp of New Ontario.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre :

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions : The full price must be paid in cash ; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to :

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch. If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers, kindly mention this Journal.

Dominion of Canada

Synopsis of Canadian North-West Mining Regulatons

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

N.B.—Unauthorized publication of this advertisement will not be paid for.

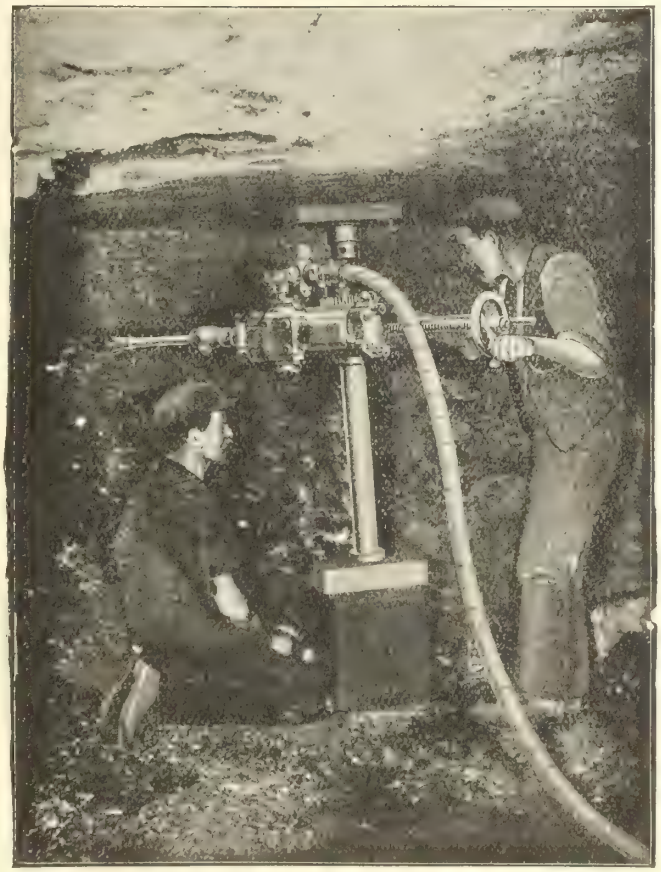
A Useful Catalogue

HAVE you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our New Spring Catalogue will be ready for mailing March 1. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. The new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of advantageous information for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.



It will include "Specials" for mining men, prospectors, and all who have heavy work to do or rough journeys to make.

CORLISS STRAIGHT LINE COMPRESSORS

FOR ECONOMICAL SERVICE

The Sullivan "Class WC" Corliss Tandem Compound Steam and Two Air Compressor, here shown, is designed to supply the demand for a compressor of the highest grade and of moderate capacity. This machine is furnished in sizes from 900 to 2500 cubic feet of free air per minute, and embodies the following advantages:

(1) It is equipped with full Corliss valve gear on both high and low pressure steam cylinders, which reduces its consumption of fuel to that of the best class of Corliss Cross Compound Compressors.
(2) It is much lighter than a cross compound compressor, thus lowering the charges for transportation and foundations.
(3) It is more compact aud contains fewer working parts; hence, costs less for maintenance.
(4) Its mechanical efficiency places it in the first rank of air compressing machines, and it performs satisfactorily all the functions of a heavier, more complicated and more expensive compressor..

The Mining Manual

For 1908

By WALTER R. SKINNER

Contains all the latest information up to within a few days of publication. The Standard Reference Work on Mines. 1,600 pages. In demy 8vo, cloth. Price 21/-, post free.

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1908 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

R. G. DRINNEN, Superintendent. **C. C. S. LINDSEY,** General Manager.

HUNTING TRIPS

THERE is no Railroad in America, probably in the world, that can bring Sportsmen within touch of so many famous haunts of big and small game as can the Canadian Pacific. From the lordly Moose of Nova Scotia and New Brunswick to the Bear and Mountain Goat of the Rockies is a far cry but it is C.P.R. all the way, traversing en route hundreds of miles of ideal hunting country.

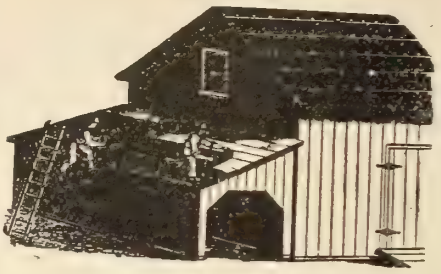
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

CANADIAN MINING INSTITUTE.

In our last issue there appeared portraits and short biographical sketches of Mr. H. E. T. Haultain and Mr. Milton L. Hersey, new candidates for the position respectively of Secretary and Treasurer of the Canadian Mining Institute.

As explained in a circular sent to all members of the Institute, the JOURNAL had intended taking no part in the approaching election. Unfortunately, just as we were going to press, a circular was issued from Montreal, signed by officers of the Institute, canvassing for the present Secretary and Treasurer. The circular might have been ignored had not the gentlemen who signed it used their official titles to lend force to their canvass. This regrettable feature could not be overlooked. The JOURNAL therefore hastened to signify its approval of the candidature of Messrs. Haultain and Hersey, and distributed a circular explaining fully the circumstances of and reasons for their nomination.

THE CANADIAN MINING JOURNAL is aware of the fact that its action may not meet the approval of every member of the Institute. On the other hand, it has good reasons for believing that a very large majority of the society's members will endorse its attitude.

Be that as it may, the JOURNAL felt that prompt rebuttal of the first circular was necessary. The Montreal letter was obviously written in haste (for its several paragraphs are self-contradictory) and with some degree of heat. This we deplore. We believe, however, that our own circular will throw light upon the situation.

If there is to be a contest, there is no need of making it a mere "row." No doubt, in the ardour of partizan enthusiasm a certain amount of feeling will be engendered. Yet this need not be carried to the extreme of attributing sinister motives and dubious methods to the other side.

It is one thing to express, very candidly, an opinion of persons and policies. It is a quite different thing to misrepresent the question on which opinions differ. The point at issue is clear. It is contended by certain members of the Institute that, for reasons fully developed in these pages and in the circular letter distributed by the JOURNAL, Mr. Haultain and Mr. Hersey will fill more suitably the two paid offices of the Institute than do the two present incumbents. The decision lies with the members of the Institute themselves. If the candidates of whom the JOURNAL approves are elected, so much the better. If they are defeated, the JOURNAL will loyally support the Institute as heretofore. But it will always reserve the right to criticize freely.

ALBERTA COAL LANDS.

There is a great area of coal lands within the Province of Alberta that is exempt from Government taxation. At least one-half the coal lands were disposed of at a time when coal rights went with surface rights.

Of last year's output only one-third rendered royalties to the Federal Government. That is, out of one million tons mined, nearly seven hundred thousand tons yielded no revenue to the Government. The royalties collected upon the remaining one-third amounted to $30,000.

However desirable the policy of granting free mineral rights to settlers may have appeared in the past, it is evident that now in Alberta it has worked as a deterrent upon development.

Coal lands and mineral lands generally are more easily negotiable from the Government than from private indivduals. Mineral lands held by settlers either lie untouched or, if discovery is made, the owner holds out for a price that is out of all proportion to the value of the deposit. In Nova Scotia the owners of "soldier grants" have proved an obstacle, often insurmountable, to the consolidation of mining areas.

Indeed, there is very little to be gained by the surrendering of mineral rights to settlers who must depend for their livelihood upon pastoral pursuits and whose knowledge of minerals is a negative quantity. On the other hand, there is much risk of loss to the Government and to the community. As in Alberta's case, certain mineral-producing lands are forever freed from yielding revenue to the Crown. Further, prospecting is, to a great extent, discouraged and the consolidation of coal-producing areas, a necessary preliminary to investment, is prevented or postponed.

Whatever may be said in justification of granting mineral rights to the agricultural settler, it cannot be denied that it does not conserve the future welfare of the country generally and of the prospector and miner particularly.

THE ANNUAL MEETING OF THE CANADIAN MINING INSTITUTE.

On March 4th the first session of the annual meeting of the Canadian Mining Institute will be held. For the first time in the history of the Institute, Ottawa has been chosen as the place of meeting. Whilst the official programme has not yet been announced, we have no doubt that it will be one of greater interest than usual. Apart from an election of much more than ordinary importance, the fact that the meetings will occur whilst the Federal House is in session makes it the duty of every member, who can possibly arrange it, making an effort to attend.

The Ottawa members themselves are working heartily for the success of the event. The remodelled Russell House will provide ample space for the meetings.

The March gathering should assuredly be made impressive if for no other reason than that of giving the Federal Government a sufficient idea of the Institute's importance and strength. We hope and believe that the attendance will be larger than ever before.

TWO ESTIMATES.

In the *Mining World* of Chicago for January 18th is an article by F. C. Nicholas, entitled "Development of the Bonanza Creek Gold Mines."

Mr. Nicholas puts a valuation of $90,000,000 on the gold contents of the property of the Bonanza Creek Gold Mining Company, Limited, whose properties are situated on the "White Channel" in the valley of Bonanza.

As this valuation is greatly in excess of that of Mr. McConnell, of the Geological Survey of Canada, who gives as the total value of all the gold in the valleys of Bonanza, Hunker, and Bear Creeks, and the Klondike River together, the comparatively moderate sum of $56,000,000, we would like to ask Mr. Nicholas if his valuation is based on personal observation, or upon information derived from others. If the latter is the case, this fact should have been distinctly stated. In addition to his valuation of the property, Mr. Nicholas places a very high value on the stock of this company. Is this value, too, derived from personal knowledge of the properties?

CAPE BRETON COAL.

It is an ill bird that fouls its own nest. There is not much patriotism about the man who will depreciate in public the productions of his own country, while at the same time praising the productions of the land of an alien. We are impelled to these remarks by the recent utterances of an honorable member of one of the Houses of Parliament at Ottawa during a debate on supply. The name of the gentleman does not matter, as THE CANADIAN MINING JOURNAL has no politics, except the politics of Canadian mining. This gentleman remarked that in his opinion the icebreaker "Montcalm" should have been supplied with Pocohontas coal, and not with coal from Sydney, Cape Breton, which we are informed "is impregnated with sulphur." The word Pocohontas is a nice rolling mouthful and is often quoted by people whose knowledge of mining is little and therefore dangerous—to themselves—not because they know the grade of coal that is mined in the Pocohontas valley, but because they have heard somebody say it is good and the name sticks. The gentleman in question also said that none of the steamship companies would use Cape Breton coal because of its wonderfully rich contents of sulphur. It is hardly to be wondered that steamships calling at

New York do not use Cape Breton coal, but we think the steamboats of the C. P. R. are as good craft as the St. Lawrence icebreakers. Both of the "Empresses" have made record trips from land to land using nothing but this same much maligned Cape Breton coal. If we are not mistaken Montreal is largely heated and lighted by this same coal, and in short practically the whole of Eastern Canada is dependent on it. Perhaps the remarks of the honorable gentleman should not be taken so seriously. He was merely making political capital, and it is really surprising how little it takes to make that valuable commodity. We would suggest, however, that it should not be made at the expense of Cape Breton's natural resources.

THE BRITISH COLUMBIA COAL AND COKE TAX.

If legislatures and legislation were not imperfect, there could be no excuse for changes in our laws. The assurance of permanence may render imperfect enactments more valuable than intrinsically better laws that are subject to sudden change.

From its very character the mining industry must be based, so far as possible, upon settled conditions. Foreign and Canadian investors have sunk large sums of money in the mines of British Columbia, in the implicit belief that the present laws would remain unchanged, or that, at least, any changes made would be directed towards the encouragement of the industries upon which the Province is depending more and more for its prosperity.

Indirectly, the improbability of increased taxation has been accentuated by two existing conditions. The low current prices of silver, lead, copper and zinc have led to the temporary cessation of mining and smelting in several of the more important districts. To offset this the workmen have recently consented to a considerable reduction in wages. It is distinctly understood that this concession is made because of the present depression and the increased cost of operations.

Again, the necessity of nursing the smelting industries has been recognized by both the Federal and the Provincial authorities. Delegates representing the lead smelters of British Columbia are now in Ottawa asking for an extension of the bounty upon lead.

From all this it is evident that the smelting industries of British Columbia have not yet reached the stage when they can resist successfully the pressure of outside competition and the vagaries of the metal market.

This being granted, it follows naturally that it is illogical and suicidal to impose a fresh tax upon industries whose permanence depends upon present government assistance.

The bearing of this conclusion upon the new coal and coke tax is obvious. The smelters are mainly dependent upon coal and coke supplied from mines in the Province. An increase in the cost of production must be shouldered by the smelters and referred back by them to the metalliferous mines whose ores they smelt. The output of metalliferous mines already is taxed to the extent of two per cent. It is doubtful whether more than one or two copper producers can stand increased charges. It is certain that lead producers cannot. And in view of urgent requests for a continuance of the lead bounty the proposed tax is anomalous.

So much for that side of the question. We shall glance for a moment at the effect of the tax upon coal and coke producers.

By section 83 of the Crown Lands Act (1888) there was reserved for the Crown a royalty of five cents upon every ton of *merchantable* coal raised or gotten from any lands acquired under the provisions of this Act. A qualifying clause provides that no royalty be reserved on *dross* or *fine slack*.

Sections 3 and 4 of the Coal Tax Act (1900) imposes a tax of five cents per ton of two thousand two hundred and forty pounds upon all coal (except on shipments to coke ovens in the Province) shipped, exported, or in any way delivered from any mine since the first day of July, 1900.

Moreover, a tax of nine cents per long ton of coke was then placed upon all coke shipped, exported, or in any way delivered from coke ovens in the Province. A proviso is inserted remitting the tax upon coke manufactured from coal upon which a tax has already been paid.

As, however, no British Columbia coke is made from run-of-mine coal, this proviso has little bearing upon the subject.

The ostensible object of the Act under discussion is the abolition of royalty, which is paid now by only a part of the coal-producers, and the imposition of a flat tax of ten cents on every ton of coal and fifteen cents on every ton of coke. At first glance this seems equitable. But when the present condition of the smelting industries and of the more easterly coal mining districts is considered, the unwisdom of the change is clearly visible.

The collieries and coke ovens of the Crow's Nest Pass Coal Company at Fernie, and the Canadian Pacific Railway mines at Hosmer supply a large proportion of the smelters of Southeastern British Columbia. At both Fernie and Hosmer plans are being carried out whereby production will be materially increased. The fuel famine of last winter, the natural expectation of increased demand from the smelters and a growing market in the United States have warranted this expansion. But, were these collieries dependent upon the Provincial smelters for a market, they could operate only intermittently and without hope of immediate expansion. That they may be able easily to meet the needs of the smelters the collieries must seek other markets. The market across the border is held in the face of strong competition. Every cent added to the cost of producing coal makes their hold upon the outside market more precarious. The freight haul in the Rocky Mountains is long and expen-

sive. Labor and supplies are also high. Hence the narrow margin of profit may disappear.

We instance the Fernie and Hosmer collieries, as it is upon these that the tax will fall most heavily. The Vancouver Island collieries, in spite of all the advantages of cheap mining, plentiful labor and easy access to tide water, have maintained an unreasonably high price for their coal and coke. The lands of the largest collieries on tide water have been exempt from royalty. Thus the tax will be no such hardship to these as it will to the eastern producers. This fact merits consideration. A flat, uniform tax does not remedy inequalities.

Many other special features governing the production of coal and coke in the Rocky Mountain districts could be adduced. They all strengthen the conviction that British Columbia will strangle a growing industry and will frighten capital away from her coal fields if the new tax is imposed. Her neighbors will undoubtedly reap the benefit of this.

Cheap coke is a necessity to the smelters of West Kootenay and the Boundary.

THE PORT HOOD DISASTER.

The distressing news that ten men had been killed by an explosion in the south workings of the Port Hood-Richmond Railway & Coal Company was received on February 7th.

Details received later announced that all the bodies had been recovered and that no serious damage had been done to the mine. A rescue party, led by Manager McLellan, succeeded in bringing the bodies to the surface within three hours of the disaster.

Six of the victims were natives of Cape Breton and four were Bulgarians. Nine of them were married.

After hearing evidence of identification, the Coroner postponed the inquest until the 12th inst.

As the Port Hood collieries are by no means gasey, and as the inspector, after making his rounds two hours before the accident, reported all safe, it is probable that the explosion was caused by the accidental ignition of powder. The posture in which the men were found indicates that they had no warning whatever. The bodies were disfigured to such an extent that their clothing was the principal means of identification.

The Coroner's report will throw more light upon the subject.

DRILL TRIALS ON THE RAND.

After a thorough trial of the overground and underground work of a number of rival types of drills, the *South African Mines'* Trophy has been awarded to the "Gordon" drill. Although several of its competitors ran it close in overground work, where drilling was done in four granite blocks; yet underground the "Gordon" proved itself superior in all respects.

The contest, arranged by the enterprising *South African Mines,* was conducted under the supervision of qualified authorities. It was watched with keen interest by mining men all over the Rand, and the results have been commented upon widely.

The conclusions reached by those who followed the contest keenly are important. The importance of improving the quality and tempering of the steels in general use, the desirability of attaching to all drills in use on the Rand a water-feed or dust-allaying device to prevent phthisis, and the advisability of using higher air pressures, are amongst the points accentuated.

THE HALL MINING AND SMELTING COMPANY.

Press despatches of February 7th announced that all the assets of the Hall Mining & Smelting Company, Nelson District, B.C., had been placed in the hands of a received on behalf of British bondholders. The plant has not been in operation since August of last year. It is believed that after re-organization, the smelter will be remodelled and the company's mine, the Silver King. will be worked.

During the fiscal year ending June 30th, 1906, the Silver King produced 1,187 tons of ore, averaging 25.5 ounces silver per ton and 4.3 per cent. copper. Whilst mining operations showed a profit of about $6,000, the smelting loss more than counterbalanced this.

Reliable authorities state that the Silver King is a valuable property and that both the mine and the smelter can be operated with profit. The smelter includes a Huntington-Heberlein installation for the desulphurization of galena ores.

Apparently the management of the company's affairs has been handicapped by internal complications. No other reason is assignable for the closing down and the appointing of a receivership.

Editorial Notes.

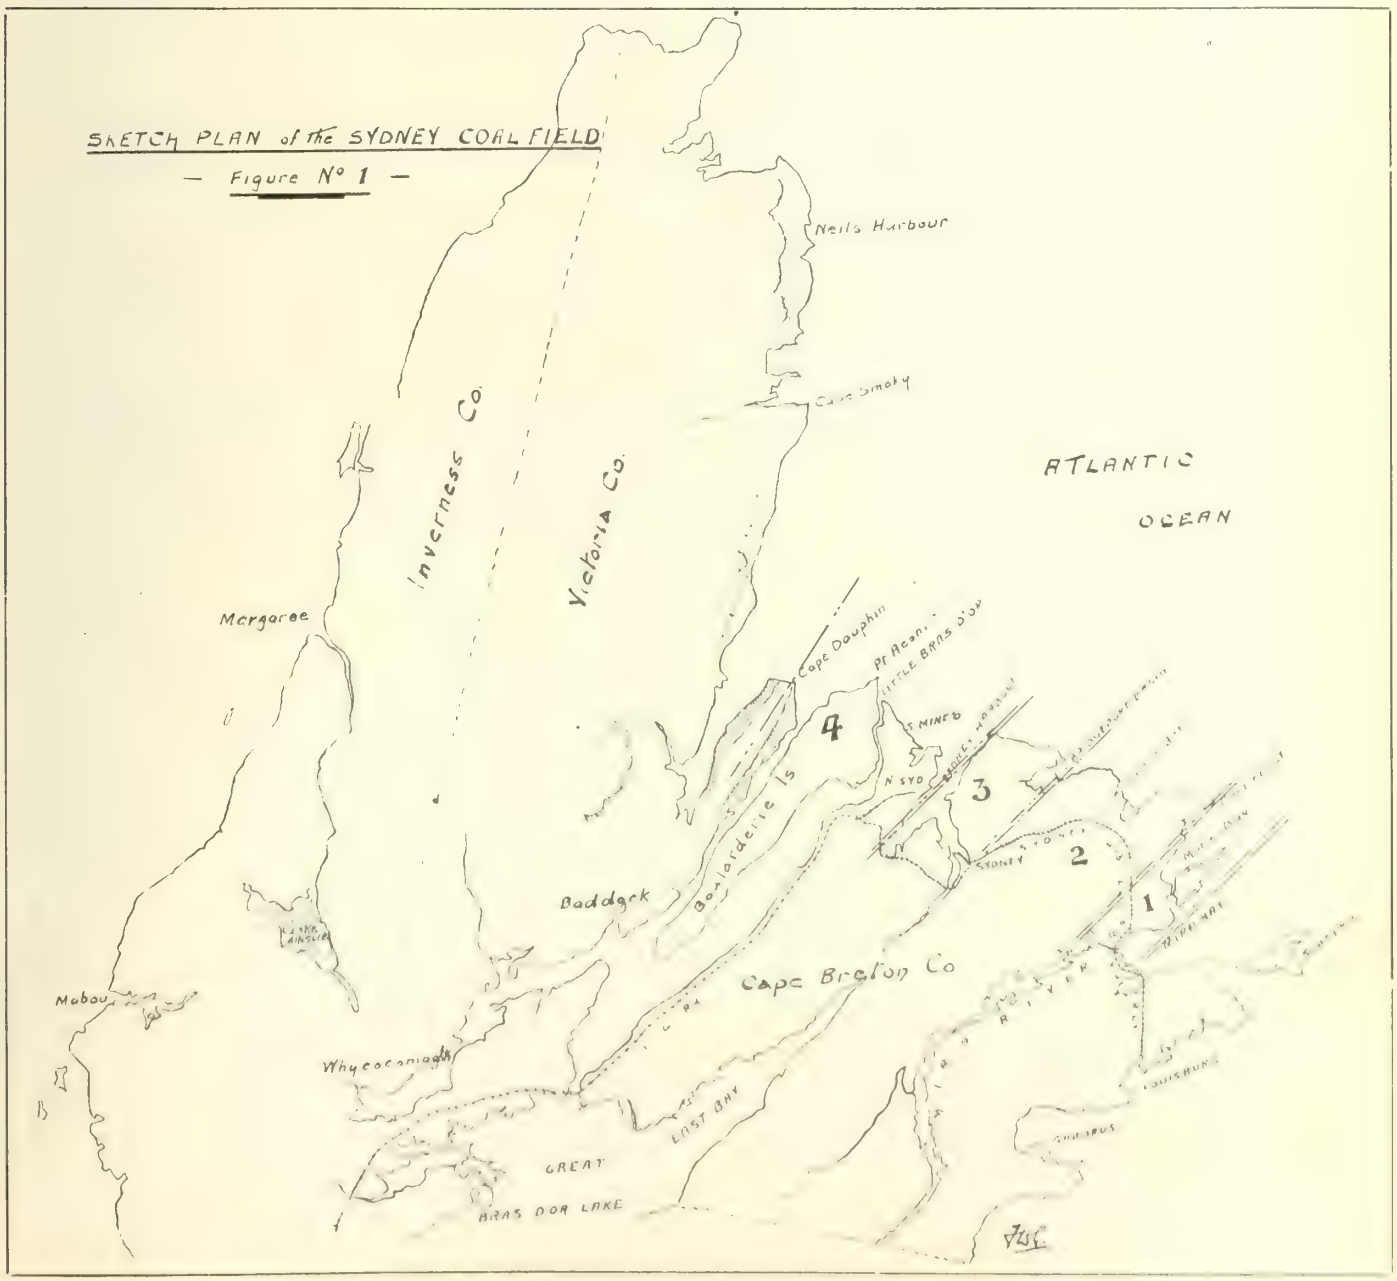
The ninety-fourth meeting of the American Institute of Mining Engineers will be held in New York on the three days beginning February 18th. The election of officers will take place on the 18th.

The Toronto Exhibition Commission has as yet made no provision for the display of mining machinery. This is a very serious omission. It is hard to understand why the mining industry should be neglected thus.

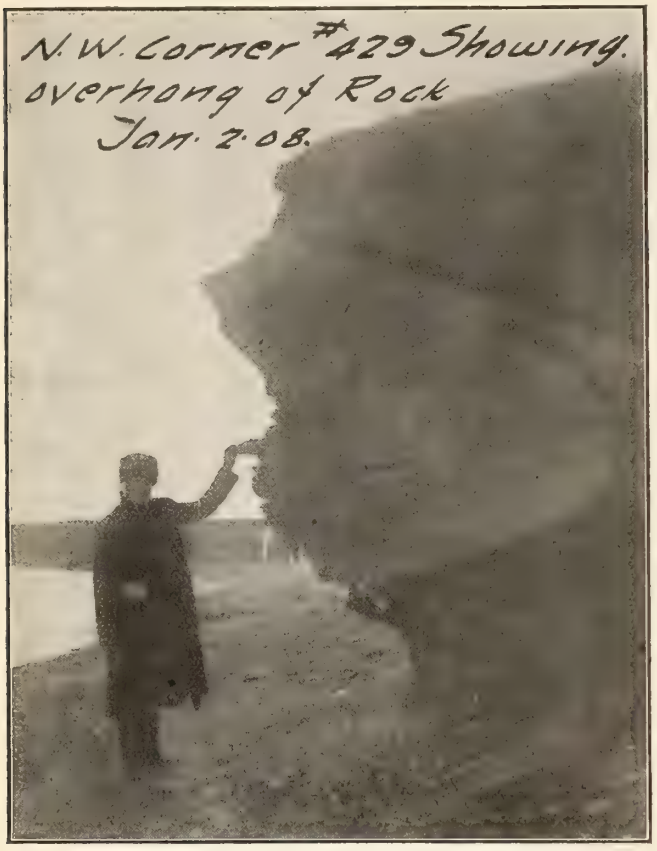
Mr. Gray's first article on the mining operation of the Dominion Coal Company is a valuable contribution to our knowledge of that company's vast undertakings in Cape Breton. Mr. Gray writes with accuracy and a complete familiarity with his subject.

THE MINING OPERATIONS OF THE DOMINION COAL COMPANY.

F. W. Gray.



ARTICLE I.—GENERAL DESCRIPTION OF THE SYDNEY COAL FIELD.



The mines of the Dominion Coal Company, which produce almost half of the entire Canadian output of coal, are situated in what is known as the Sydney coal field, an extraordinarily rich tract of coal-bearing country having a superficial area of 250 square miles, extending for a distance of 35 miles from the outcrop of the Millstone Grit at Mira Bay to the abrupt range of intruded syenitic hills that end in Cape Dauphin and form the northern shore of the Great Bras d'Or entrance and continue alonge the Atlantic seaboard of Victoria County. The manner in which the Cape Dauphin promontory rises precipitately draws the attention both from a geological and scenic aspect.

The great basin of the Sydney coal field is divided into subordinate basins by folds in the strata that run approximately northeast and correspond roughly with the depressions that form the strikingly parallel arms of the Bras d'Or Lake and the Mira River. The basins thus formed are, counting in order from east to west (see accompanying sketch plan):

1. The Morien Basin (sometimes called Cow Bay Basin), bounded on the east by the crop of the Millstone Grit and on the west by an anticline that runs into the sea at Cape Percy.

2. The Glace Bay Basin, bounded on the west by the Bridgeport anticline, which is parallel to the Cape Percy fold, and parts the Glace Bay Basin from the Lingan-Victoria exposure.

Overhang of Rock near Point Aconi.

3. The basin-like formation that is a feature of the Morien and Glace Bay fields is not so pronounced in the Lingan-Victoria tract, but nevertheless it may be properly classed as a basin having its western limit somewhere under the waters of the entrance to Sydney Harbor. It is not necessary to assume that the measures are interrupted, and it is now very generally supposed that they are continuous with those on the other side of the water.

4. The Sydney Mines Basin (or the Bras d'Or Basin) extends from the waters of Sydney Harbor to the termination of the coal measures by Cape Dauphin.

In all the basins the general trend of the dip is seawards, and the seams rapidly gain cover under the ocean, as the floor of the Atlantic shelves very gradually indeed, the present coast line with its comparatively insignificant cliffs being the result not of any dislocation of the strata but simply of erosion by the sea, as is very clearly demonstrated by Mr. Brown in his treatise on the coal fields of Cape Breton. The erosive action of the ocean is to be daily witnessed along the sandstone and shale cliffs that compose the coast line in the productive measures. The heavy seas that beat along these shores are assisted in their attacks by the disintegrating effect of the winter frosts, and the piles of debris that line the bases of the cliffs in the spring bear eloquent witness to this until they disappear with the ebb of the next storm. It was the exposure of thick coal seams along the coast by the sea's action that first drew attention to the coal wealth of Cape Breton. The photographs accompanying will convey some idea of the ceaseless encroachment of the Atlantic on these shores. In one photograph the overhang of the cliff will be noticed, weighted by huge icicles, and in another a spruce tree is about to slip into the sea. These two photographs are taken in the neighborhood of Point Aconi. The other view is near Northern Head on Lingan Bay—or Indian Bay—and is very typical. It is stated that at some points the yearly encroachment of the sea averages from five to seven inches, and the shape of the coast line is constantly changing.

The extent of the submarine coal field is unknown and cannot be conjectured, but the reappearance of the coal measures at Neil's Harbor, about 35 miles north of Cape Dauphin, may indicate that the Sydney coal field is only the lip of the saucer, only a fragment of the circumference of a vast submarine coal deposit that may for all practical purposes extend indefinitely. However this may be, it is certain that there is submarine coal to be won up to the limits of the haul that is permitted by the present stage of mechanical haulage.

Vast, however, as are the submarine coal resources of Cape Breton, they are as yet practically untouched with the exception of the workings of the Nova Scotia Steel & Coal Company under Sydney Harbor and the workings of the Dominion Coal Company in the Hub Seam off Table Head. It is rather a coincidence that probably the most extensively worked submarine coal field, outside of those in the north of England, are situated under the waters of Sydney Harbor, New South Wales. That the value of the Cape Breton sea coal is appreciated by the Provincial Government is evidenced by the fact that the Premier of Nova Scotia has recently approached the operators on the advisability of getting outside expert advice to aid them and the Government in drawing up laws and regulations that shall conserve the property of the nation whilst affording assistance to the operators in their development of the submarine coal fields. It is evident that the present regulations are inadequate and require modification in view of the extensive experience that has been gained in submarine mining both in Cape Breton and in other parts of the

Recent Slides near Point Aconi.

world since the present code of regulations was drafted, and it is to be hoped that the Government having taken this initiative will secure the very best advice that is to be obtained for this important purpose, as they no doubt will.

The Sydney coal field is justly famed for its varied and numerous fossil flora. Near Cape Percy is a remarkably fine exposure of fossil trees imbedded in the face of the cliff, and the shales and sandstones along the coast contain excellent specimens of plant remains, foot prints, ripple marks, and marine fossils. The fossil zones are well defined, and are associated with the seams in a regular manner. There are a few beds of what are locally known as "corrugated shales" which are composed almost entirely of the fossil remains of small crustaceans, which, like the "mussel beds" of the coal fields of the English Midlands, are remarkably persistent in their horizons, a fact that was well brought out by Dr. Ami in the Steel-Coal trial at Sydney recently, where he proved conclusively the equivalency of the coal seams and the identity of two separated portions of the Phalen Seam in the Glace Bay Basin, a thing, by the way, that nobody had ever questioned before the famous trial, and to prove which was absurdly easy to any geologist who knew his business. It was amusing to hear the wealth of detail and geological lore that was brought forward to sustain a fact that had been accepted since 1874, and which must now be settled for all time for the courts have said it, although, unless the newspapers lied, somebody did say that geology had nothing whatever to do with the Phalen Seam! Indeed the regularity and sameness of the Cape Breton coal seams is quite characteristic when they are considered as a whole, the dips are very uniform, except near the folds, and in the more or less disturbed Morien Basin; the thickness of the seams varies very little, there are no faults or dislocations of the strata, the seams are clean and free from dirt bands, and generally speaking the mining conditions are easy, and, except in the submarine territory, present no engineering difficulties of any moment. In the Report of Progress, Geological Survey of Canada, 1874-5, Mr. Chas. Robb referred to the seams of the Sydney coal field as follows: "In taking a general view of the mode of occurrence of the coal seams in this field, it appears that, although local variations are neither few nor small, their similarity of conditions and persistency over great areas is very remarkable. The disturbances which the strata have undergone are not of such a nature or amount as to occasion any great uncertainty in regard to the equivalency of the various seams at different points." Referring in particular to the Glace Bay Basin, Mr. Robb said: "The attitude of all the seams in the Glace Bay Basin (extending for a length of about 12 miles) as ascertain by careful measurement and recorded on the map is a striking proof of the general regularity of deposit and the absence of faults which characterize this district."

The Dominion Coal Company control areas in each of the subordinate basins as follows: Areas at Point Aconi, largely submarine, the whole of the Lingan-Victoria and Glace Bay seams, and areas in the Morien Basin. At the present time their operations are confined to the Lingan-Victoria and Glace Bay sections, and more particularly to the latter field, with which we will deal in the next article. The seams in the Glace Bay Basin have been more extensively worked and are better known by name than those corresponding to them in the other basins. Taking the table of equivalency given by Mr. Robb, we have the following seams in the Bridgeport sections:

	C.	M.
Hub Seam	9 ft. 5 in.	
		344 ft. 4 in.
Harbor	6 ft. 1 in.	
		238 ft. 7 in.
Boutillier	4 ft. 0 in.	
		92 ft. 1 in.
Back Pit	4 ft. 0 in.	
		83 ft. 3 in.
Phalen	8 ft. 7 in.	
		108 ft. 1 in.
Emery	1 ft. 8 in.	
		279 ft. 2 in.
Gardiner	5 ft. 9 in.	
Total coal .....39 ft. 6 in.		

Overhang of Rock near Point Aconi.

The better known seams bear names in the different basins as follows:

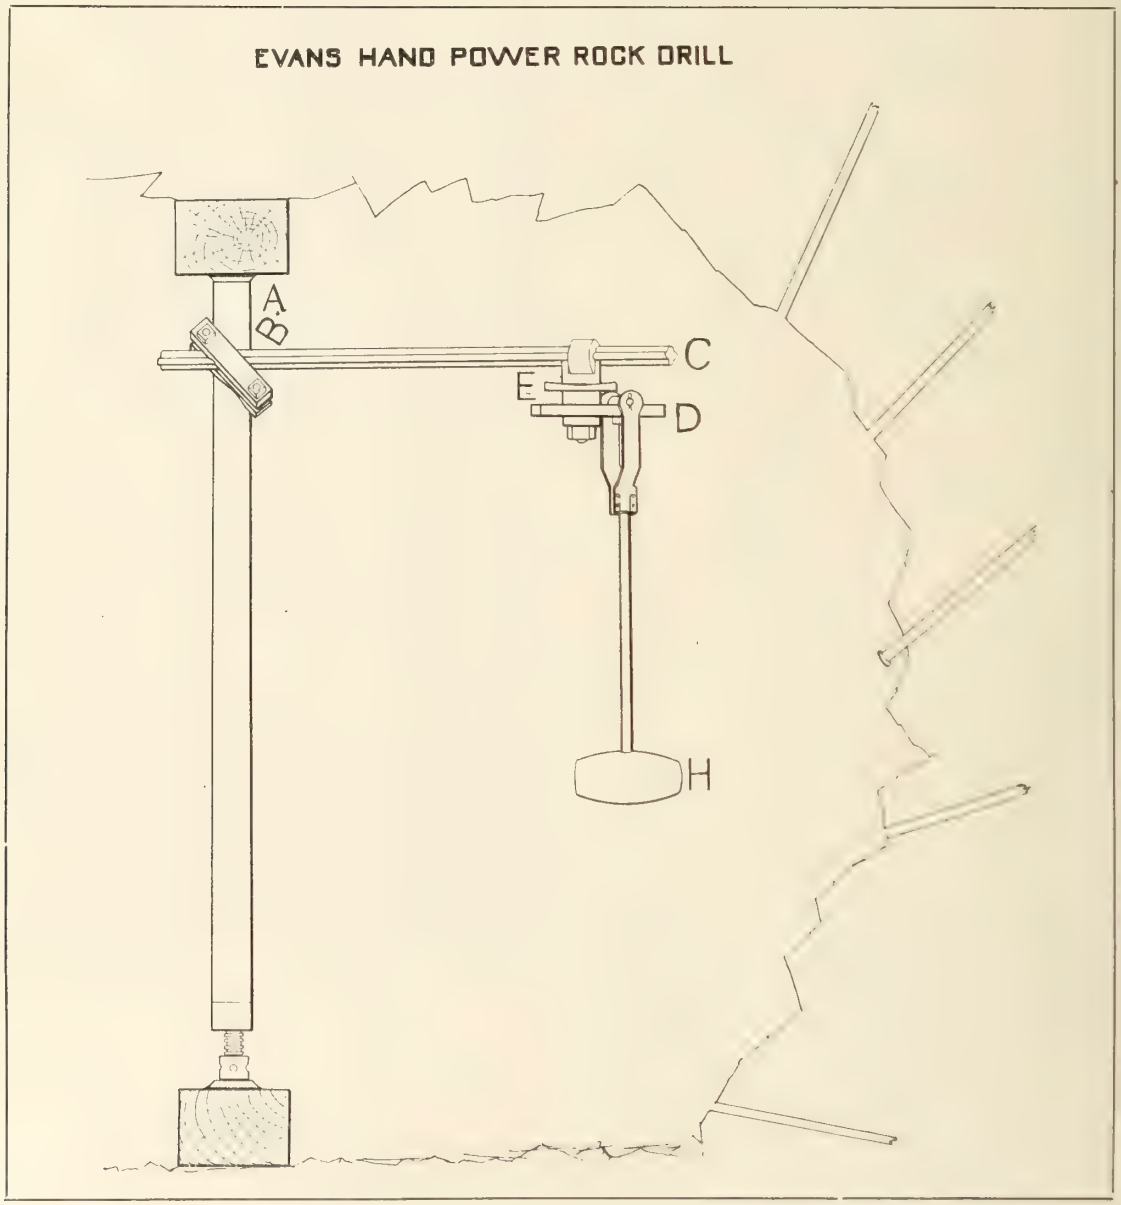
	Morien.	Glace Bay	Lingan-Victoria.	Sydney Mines
Hub Seam		Hub	Barasois	Chapel Point
Harbor	Blockhouse	Harbor	Victoria	
Phalen	Mc. Aulay	Phalen	Lingan Main	Sydney Main
Emery	Spencer	Emery	McGillivray	Collins

It is solid proof of the painstaking and careful character of the work of the Geological Survey that the maps and table of the report of 1874-5 are yet accepted as the standard reference in all matters relating to the geology of the Cape Breton coal measures, and later prospecting and discoveries only confirm their main findings. The next article of this series will deal more particularly with the mines on the Phalen Seam in the Glace Bay Basin.

A HAND POWER ROCK DRILL.

L. B. Orchard.

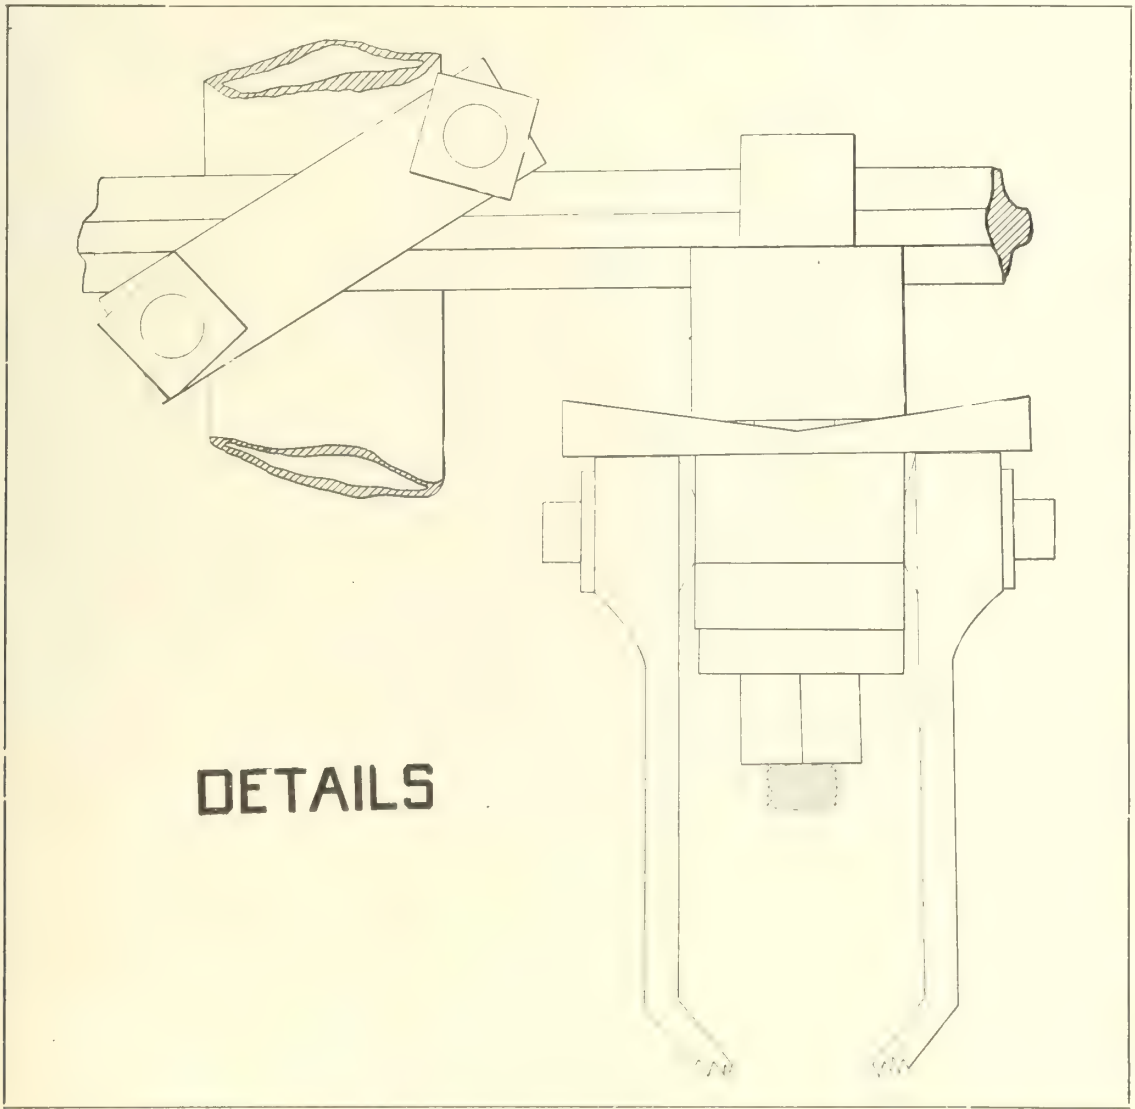
The accompanying sketches and photograph are of a hand power rock drill which has proved from experience to be a very efficient machine.



It was first experimented with about two years ago, since when, time and experience have created many improvements. In its present condition it thoroughly fulfills its requirements, the mechanism is simple and there are no delicate parts to get out of order. Little concern has been given to the possibilities and advantages of a hand power rock drill, which no doubt, is due to the fact that so far no hand power drill has been introduced that will amply fulfill the requirements of either the mining engineer or prospector.

In this article it is my intention to show the advantages that will accrue from its use, both in prospecting and in opening up a mine and in further development in mines where compressed air may already be installed, but before doing so it will be advisable to give a brief description of the machine itself.

A. A small column as used with power drills.
B. Clamp of bent steel rod, threaded at ends.
C. 1 1-4 inch steel arm.
D. Short moveable arm.
E. Double wedge ring.
H. Hammer.



Of course it will be readily seen that this machine can only be used for raising or drifting. The erection of the machine takes but a few minutes, and the whole face of a drift can be drilled off from the initial setting of the column. The machine is set up in four sections—the operation is obvious from the accompanying sketches, and so need not be described; the double wedge ring E is for plumbing up the hammer, a tap in the required direction being all that is necessary; D is a short moveable arm, which enables the hammer to be moved to any necessary position.

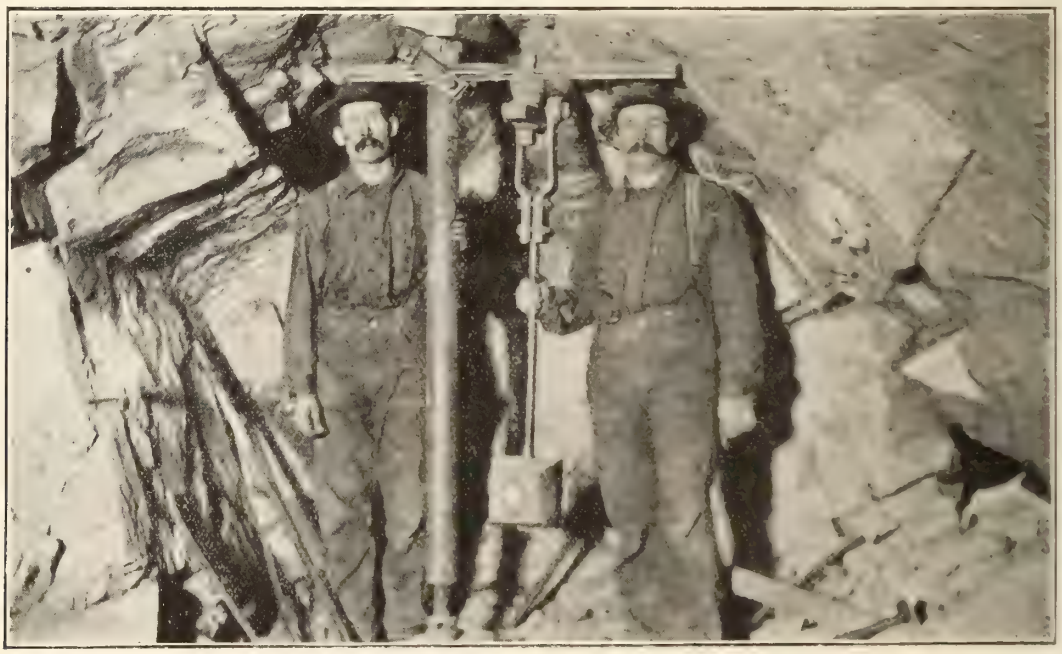
The machine is operated by two men—one twisting the drill, the other striking. For operation on a lifting hole

the man striking sits on a block of wood and grasps the drill with both hands just above the hammer head and strikes with a similar action to that used in rowing, a full swing of the body from the hips, the hammer striking the drill while still on a downward direction; on others, the uppers, breast and cut holes the striker stands. In this position only one hand is required for striking; the momentum of the hammer is very great, and all that is necessary is a sharp pull on the rebound of the hammer and a push at the other end of the stroke—a hard rock can almost be called a valuable help, as the rebound is so much greater, and hence assists the operator. On an upper hole the hammer will swing and strike the drill deep holes, which means a more powerful blast, and so less drilling for the breaking of the ground.

Only the very best steel should be used—Jessop's or Cammel's English brands are good—but a cheap steel cannot stand the heavy blows. In the tests 1 1-2 inch to 2 inch holes were put in, using 1 1-8 inch and 1 1-4 inch X steel. The speed of the hammer varies according to the position of the hole, but from 40 to 60 blows per minute can be given on a 3 1-2 foot shaft and a hammer of 80 pounds. The hammer is of cast iron, with a steel facing, beveled, which enables the successive blows to hit fair on the drill head as the drill drives home. It has been pointed out to me that one disadvantage was

Evans Hand Power Rock Drill.

twice, after the initial blow, which shows that the machine is very easy on the men. Another very pleasing feature about it is that it is impossible for the striker to miss the drill, and this in itself should be very gratifying to many who have suffered tortures, mental and otherwise, whilst twisting for a novice striker!



Hammers of different weights up to 120 pounds have been tried, but the most satisfactory weight has been found to be 80 pounds. In soft ground too hard a blow will cause the drill to cut too deeply and so stick, whilst in hard ground the drills will bend. With an 80 pound hammer one can understand that this makes quite a powerful machine, which enables men to put in by hand that the "cut hole" was a "dry hole," but in practice I have so far failed to see the disadvantage. True enough a "water hole" is usual, and perhaps a little better, especially in the case of a power drill, but this slight disadvantage is so outweighed by other direct advantages that it can be ignored.

The machine is especially adapted to prospectors in new districts or in small mines where power drills are not installed; it is very easily taken apart and weighs all told under 200 pounds, the heaviest piece being the hammer—80 pounds—and all can be neatly packed on a horse.

In large mines, even where the air drills are installed,

it is very often desirable to drive small prospect drifts but not considered worth while to use a power drill. Here this machine will be found very convenient—the drill can be moved easily from one part of the mine to another, a much smaller drift can be put in than can be done by hand steel, and it can be driven very much faster and cheaper. If necessary two machines can operate simultaneously at the face of the drift without any interference with one another. Cheapness is a very important item in development work, and it is here where this machine should prove of value. All will readily understand and agree (except of course the office management and shareholders) that a certain amount of development work has to be done in any mine, and if that cost can be considerably reduced so much the better for the mining engineer and shareholders.

By a series of careful tests in various grounds the drill has shown an actual saving of 50 per cent. in the cost of drilling. In a cross cut from a main drift the Evans machine drove in one direction and hand steel was carded for the type already described. Evans Bros., of Marysville, B.C., are the inventors, and have, I understand, taken out basic patents in Canada, United States and Mexico.

Evans Hand Drill Set Up.

used in the opposite. Both were in similar ground, and after about three weeks' work on measuring it was found that the Evans drift was in almost half as far again as that of their opponents. The ground was not very hard, and so rather favored the hand steel men. This was a true and fair test.

It must not for one moment be thought that it is the intention that this drill could or should supplant power machines—far from it. But of this I am sure, that the prospector will find that he can do more and better work with it, and that with a minimum expenditure of energy, whilst to the engineer it should prove a valuable aid in the necessary development of his property.

It is so simple that any miner can put it up and use it. It is strong and well built, and should last a lifetime. I don't think even a miner can put it out of business or break it, and as we all know that is very little that he can't do!

The photograph shows the drill set up at the Bay Mine, B.C. This was the first machine made, and it will be noticed the hammer is square; this has now been dis-

NOTES ON CANADIAN ASBESTOS MINING.

By Fritz Cirkel, Mining Engineer, Montreal.

The asbestos industry in the Eastern Townships, although suffering from the financial depression across the dorder, and the consequent sluggishness of the market at the present time, plays a prominent part in the mineral production of the province, and if the demand during the current year proves as large as it was last year, with such satisfactory prices, we shall witness quite an increase of production, especially of the fibre quality of the mineral.

In addition to the established Black Lake and Thetford districts, the East Broughton asbestos region, through the valuable discoveries therein of asbestos-bearing ground, has come into prominence of late. From the fourth up to the tenth range in the Township of Broughton on all lots numbered 13, asbestos has been discovered in more or less economic quantities, and the explorations which have been carried on for the last year or two undoubtedly tend to show that this East Broughton district will before long become a prominent factor in the asbestos industry.

When Mr. H. H. Williams, the general manager of the Broughton Asbestos Company had the courage to attempt the production of fibre from the areas that he has since so successfully worked, many an asbestos man had his grave doubts as to the outcome of the venture. It was even predicted by some that this enterprise would be a complete failure, on account of the comparatively small quantity of crude asbestos to be found. How wrong these men were in their judgment will be seen from the fact that the Broughton Company not only has made innovations and improvements in their mill to meet

the peculiar conditions governing the occurrence of asbestos in that region, but has recently doubled its plant and capacity.

Other companies have sprung up and have either built mills or have made arrangements for doing so. The Quebec Asbestos Company has been working now for a number of years, and treats the rock in a 100 ton mill. The Eastern Townships Asbestos Company has just completed a 200 ton mill, while the Frontenac Asbestos Company, and the Boston Asbestos Company are each constructing a 300 ton plant on their properties to the east of the Quebec.

New Asbestos Mill of the Eastern Townships Asbestos Company, East Broughton, Que.

When all these mills are completed we shall have five mills in operation which will handle in the aggregate about 1,000 tons of asbestos rock per day, or produce from 80 to 100 tons of fibre.

The pits at the old Miller and Tanguay properties have recently been pumped out and examined by an expert; seven tons of the rock from both properties have been subjected to a mill test, and the results have been highly satisfactory to the owners. Some years ago the Miller mine had been worked for crude asbestos only, and the qualities produced are said to have been equal to those in Black Lake.

Quite a considerable showing has been made on the Tanguay property; here in a shaft 15 feet in depth, regular vein asbestos has been found similar to the crude asbestos of Thetford, while in the western part a number of outcrops exhibit the fissured serpentine asbestos, which is so characteristic of that locality.

On the Tachereau property, the most westerly asbestos property of East Broughton, quite a number of asbestos outcrops have been laid open. A company is being formed now in Quebec which will erect a mill on the premises.

The new mill of the Dominion Asbestos Company in Black Lake, which has been erected at a cost of some $150,000, has had the first trial run to test the machinery some few days ago. A special feature of this mill is the absence of the Cyclone pulverizer, which has been entirely replaced by a series of coarse and fine rolls. The company that is building this mill has acquired some asbestos ground from the Standard Asbestos Company, and it is said that when everything is in running order from 35 to 40 tons of asbestos will be produced daily.

The asbestos property belonging to the Black Lake Chrome & Asbestos Company, located near Black Lake, below the railroad track has recently been examined by an expert, and it is reported that negotiations are under way for the acquisition of the property by a powerful syndicate.

The Union Asbestos Company, controlled by German capitalists, and operating on the high surpentine ridge 900 feet above the railroad track at Black Lake, has resumed operations, after a shut down for over 4 years.

THE PROPOSED UNITED STATES BUREAU OF MINES.

From the Director of the Geological Survey of the United States, Dr. George Otis Smith, we have received a copy of a letter submitted by him to the Secretary of the Interior. We reproduce this letter in its entirety. It is most significant to Canadians. The results of the present movement in the United States and the final determination of the best relationship to be established between the the Survey and the new technologic department will have a very direct bearing upon our own Departments at Ottawa.

January 7, 1908.

The Honorable

The Secretary of the Interior.

Sir:—

I have the honor to submit the following statement, in reply to your request for an expression of an opinion relative to the desirability of a more extensive recognition of the mining industry by Government investigations:

The beginnings of federal investigations of mineral resources are to be traced back to the early part of the last century, when Lewis and Clark were instructed to pay special attention to the geology and mineral resources during their exploration work. The explorations and surveys which were continued during the first half of the nineteenth century were further recognition of the duty the federal government owed the people in making known the resources of the great unexplored western half of the continent. These explorations were particularly actively pushed after the discovery of gold had focused public attention on the mineral wealth of the trans-Mississippi region. While the results of these various surveys were of inestimable value to the development of the mining interests of the regions which they covered, yet there was lack of co-ordination and an absence of a comprehensive plan covering the entire field. Moreover, it had not yet been recognized as the province of the federal government to investigate the resources of th entire national domain and not simply those of the public lands.

In 1866 a more direct attempt was made to aid the mining industries by an appropriation which authorized the Secretary of the Treasury to "collect reliable statistical information concerning the gold and silver mines of the Western States and territories." Though this

investigation received very inadequate financial support, yet the results obtained by Dr. R. W. Raymond were of the utmost value to the mining interests.

When, in 1879, the United States Geological Survey was authorized by Congress, all other federal surveys of a similar character were abolished, and the office of Commissioner of Mineral Statistics under the Treasury Department also lapsed. The organic law provided that the Director of the Geological Survey "shall have the direction of the Geological Survey and the classification of public lands and examination of the geological structure, mineral resources and products of the national domain." It is to be noted that this authorization, besides providing for geologic investigation also directly authorizes the study of mineral resources and the products of the national domain. It would appear, therefore, that Congress believed it was providing for all phases of work which should properly belong to a mining bureau. In any event, the first director, Clarence King, regarded the law as a justification for him to undertake investigations of not only a geologic character, including examinations of ore bodies, but also the study of mining and metallurgical methods. This fact is clearly shown in the summary of his first report, wherein he provides for the following publications, based on investigations inaugurated by him:

Geology and Mining Industry of Leadville, Colorado.
Geology of the Eureka Mining District.
The Copper Rocks of Lake Superior.
History of the Comstock Mine.
The Comstock Lode.
Mechanical Appliances Used in Mining and Milling on the Comstock Lode.
Coal of the United States.
Iron in the United States.
The Precious Metals.
Lesser Metals and General Mineral Resources.
The Uinkatet Plateau.
Lake Bonneville.
Dinocerata.

Out of these thirteen publications it will be noted that ten were to be devoted to the subject of applied geology and technology, and it is evident, therefore, that King regarded the U. S. Geological Survey as being charged with the duty of directly serving the mining industry of the country. Unfortunately, the broad plan of investigation which King had outlined could not be carried out because of the inadequacy of the funds provided for the work. It appears that King's successor, Major Powell, on this account established as his policy the plan of carrying on the fundamental geologic work which he knew was absolutely essential as a preliminary to the solving of the problems connected with economic geology. Major Powell's success, therefore, as an administrator of scientific work was due to the fact that he laid the plans on broad scientific lines. He also organized a division of statistics and technology, but, unfortunately again, this work received so little support that not much original investigation could be carried on.

In 1894, when Mr. Walcott took the leadership of the Geological Survey, he was quick to realize that the time had come when more attention should be given to the immediate wants of mining interests. His plan, therefore, involved investigation of nearly every phase of the mineral resources of the country, though at the same time he did not curtail the study of the larger geologic problems. Probably the most important feature of Mr. Walcott's administration from the standpoint of mining was improvement in methods of collection of statistical data, and by his advice this work was extended to include that of the previous metals. Mr. Walcott went back to Clarence King's original plan of placing the supervision of the collection of mineral statistics in the hands of the expert economic geologists, as being the only men who could have a comprehension of the resources to be condsidered. As a result, the statistical work of the Survey is on the highest plane and is frequently quoted in this country and abroad as an example of what all other countries should inaugurate. Under Mr. Walcott, too, technologic investigations were inaugurated; but these were limited by the appropiations to definite fields.

Under both Powell and Walcott the development of topographic mapping of mining districts was actively pushed. This phase of the Survey work, like the investigations of geologic problems, is of fundamental importance to all economic work.

To summarize briefly the items in the work of the Geological Survey which bear directly on the mining industry:—

1. Annual reports showing the mineral production of the various mining districts and the various mineral products and also those which summarize the mining development throughout the country. These reports have the most direct bearing on mining, but they could only be prepared because of the extensive investigations which had preceded them during the existence of the Survey.
2. Monographic treatises on particular mining districts or particular kinds of mineral deposits.
3. Geologic maps, which must form the basis of the study of the distribution of mineral products. An area of 138,536 square miles is already covered by these maps.
4. Reports on water resources, many of which pertain to power available for mining.
5. Topographic base maps for the use by mine operators, mining engineers and prospectors, as well as for the use in the study of geology.
6. Technologic studies of mineral products. This so far has been practically limited to the investigations of the utilization of the mineral fuels and building material.

The Survey investigations relating to mining have all been approached from the standpoint of the scientist, a policy believed to be in accord with the spirit of the Congressional enactment establishing this branch of the public service. The present importance of economic or applied geology is to a large extent the result of the Survey's activity and the practical value of its contributions has won world-wide recognition. In the present organization of the Survey, two divisions of the Geologic Branch and one of the Technologic Branch are devoted exclusively to the mining industry, while a large part of the work of the Technologic Branch and of the Division of Geology and Paleontology and of Chemical and Physical Research in the Geologic Branch, contribute directly to the aid of the mining industry of the country, not to mention the indirect, but important service rendered by the Water Resources Branch and the Structural Materials Divisions of Mining and Mineral Resources and of Alaskan Mineral Resources, are at present keeping in close touch with the mining industry. Through their work, the Survey is in possession of complete lists of the mines of the United States and also nearly complete lists of Alaskan mines and from these mines the division receives statements of annual production. On this basis summaries of the state of the mining industry at the

close of each year are prepared and published. The importance of this statistical work has been clearly stated by Dr. R. W. Raymond, formerly Commissioner of Mineral Statistics, and an eminent authority among mining engineers, who, moreover, has recognized the Survey as the successor to the investigations and publications inauguarated by him.

The Geological and Water Resources Branches have for several years been conducting a joint investigation of the debris problem, which had never before been adequately considered on a scientific basis. The technologic work relating to mineral fuels has been authorized by appropriation items, yet this work undertaken under Director Walcott differed little in scope from investigations planned by Director King, but necessarily for a long time neglected in the absence of any specific appropriation by Congress.

While it might be held that the organic authority granted the Director to examine the geologic structure, mineral resources and products of the national domain is sufficient for any extension of the mining work, yet in view of the present well warranted demand for expansion of such mining work, it seems advisable to secure from Congress specific authorization for these investigations. However, before considering the best means of providing for the new work in aid of the mining industry it is necessary to mention the lines along which extensions of federal work is requested. Especially is this important since there does not appear to be any concensus of opinion as to exactly what should be the scope of a new bureau or what shall be its relations to the existing organization. In fact some of those who have advocated further recognition of the mining interests have been unfamiliar with the work of the Geological Survey, and have not realized how closely its activities were related to the mining field. First among the kinds of mining work for which there has for many years been a steadily increasing demand, is the study of ore and mineral deposits. The work of the Geological Survey in the interests of the prospector and mining engineer has been appreciated throughout the mining communities. Two only of many cases of official recognition of the value of the Survey's work need be cited in this connection. The Legislature of Pennsylvania, the state which stands first in the value of its mineral products, provides for co-operation in geologic work with the federal survey, entrusting to the latter the expenditure of State money in the investigation and mapping of its mineral resources. The General Assembly of the State of Colorado, has twice, at least, expressed its appreciation of the Geological Survey. In 1879 in a memorial to Congress, presented by Senator Wolcott, this assembly petitioned Congress "to make generous provision for that branch of the United States Geological Survey which is engaged directly in examining metalliferous districts of the states and territories," and urged speedy publication of the results.

Ten years ago the statistics of mineral production collected by the Geological Survey were regarded as incomplete in that those of gold and silver were not included and a public demand was made for the inclusion of these statistics in the annual report of the mineral resources of the country. At present the collection of these has been authorized by Congress. The Survey's policy that the mining industry of the country is stimulated and guided by the distribution on the part of the Government of statistical and technical information has commended itself to the mining public generally and it has been well said that the distribution of knowledge is the one governmental activity which carries the largest probability of general benefit. Many authorities have emphasized the necessity of entrusting its statistical work to geologists, who not only can properly classify each year's production, but can measure the amount of the nation's reserve of mineral wealth.

There is another field in which the demand is actuated by real needs and this includes investigation into the methods of mining and metallurgy, especially with reference to the prevention of accidents and the better utilization of mineral products. Investigations already made along these lines by the Geological Survey show that this work lies well within the province of the Federal Government. Yet a large part of the field is as yet unoccupied and would include reports on the newest development in the various branches of the art and short summaries of mining and metallurgical methods for the use of prospectors and operators.

Many advocates of a Department or Bureau of Mines mention the need of federal inspection of mines. The inspection of mines except in the territories and the district of Alaska belongs essentially to the police regulations of the state authorities, so that in the absence of any federal law regulating the operations of mines there is no field for a system of mine inspection, regulation and supervision, except within the territories where this is already performed by inspectors who report to the Geological Survey. However, the publication of the results of investigations on this subject of mining methods and the nature of explosions in their relation to gas and dust in coal mines, the character of explosives and other subjects affecting the safety of mine employees and of mining property, constitute a duty which the Federal Government might and should assume through a scientific bureau.

The investigations of labor conditions in the mining industry and of the capitalization of mining corporations are functions delegated to mining bureaus in some foreign countries; but these are subjects that in the United States plainly belong to the appropriate bureaus of the Department of Commerce and Labor.

The expressed desire for free assays and analyses and for examinations of private mining property is complimentary to the character of the work performed by the various scientific bureaus of the Federal Government; but in my opinion this demand is for private and not public work, and can more properly be met by the private assayor and mining engineer as well as by the State mining bureaus and schools of mines, leaving for investigation by the Federal Government only the larger interstate and federal problems that are basal in character and important to the whole mineral industry. The investigations already carried on by the Geological Survey are of this type.

To recapitulate: Of these functions mentioned by advocates of extension of federal activity, two, namely, the study of mineral deposits and the collection of production statistics have been performed by the Geological Survey since it organization and the extent of such work has been limited only by the amount of public money appropriated; two others, namely, the investigation of mining technology and the supervision of federal mine inspection in the territories are now definitely provided for in the Survey organization—the scope of technologic work being as broad as is authorized by the terms of the appropriation; and of the remaining two, the investigation of labor and corporation conditions belongs to another Department, while the work of assays and examination of private mining property is more

properly the privilege of men in professional practice or of a state bureau than it is the duty of a federal bureau.

To meet the actual needs of the industry, the time is opportune for the enactment of well considered legislation and I submit herewith the draft of a resolution which in the opinion of myself and associates in the Survey, is adapted to accomplish the desired end. My purpose is to suggest legislation that will adequately provide for an increase in the mining work by the Federal Government without duplicating that already authorized. Some plans already presented for a bureau of mines have contemplated taking over much or nearly all the work of the Geological Survey; others have confined the proposed mining bureau's activities to the more purely technologic problems together with the statistical work.

It appears to me that there is only one true line of cleavage between these subjects, and this lies between the pure technology and those matters relating to the distribution, occurrence, origin and production of mineral deposits. Those who advocate the turning over to another organization the statistical work of the Survey have little comprehension of the true character of these investigations. As now carried on, this work embraces not only the tabulating of the statistical information, but also the discussion of the source of the materials themselves. It is true, that no other Government in the world is handling its statistics in this way, but the Geological Survey work has been often cited, especially in late years as the logical method of carrying on the work of mining statistics to meet the real needs of the mining industry. I need only mention the fact that in the case of Germany, universally recognized as a leader in the application of science to industry, the system of collecting mining statistics is being remodeled on lines acknowledged to be similar to those of the United States Geological Survey.

In my opinion, therefore, the whole question resolves itself into that of making adequate provision for the work now conducted by the Technologic Branch of the Geological Survey. These investigations have proved their value and their scope may well be expanded along technologic lines without duplicating or over-lapping the work of other branches of the Survey. On this subject the "Engineering and Mining Journal," under date of December 7th, stated editorially:—

"If a bureau of mines is to be established it is highly important to co-ordinate it with the Geological Survey, and the utmost care must be taken to see that the well-proved usefulness of the latter does not suffer. Indeed, it is almost inevitable that the Geological Survey and a bureau of mines must be conducted under one head, if efficiency and absence of friction are to be insured. In this respect the Canadian experience may profitably be studied."

On the basis of the historic development and present status of federal work in aid of the mining industry of the United States, the limitation of the function of any organization independent of the Survey to strictly technologic work is, in my opinion absolutely essential, if duplication of work and rivalry are to be avoided. To the same end I wish to place great emphasis upon the importance of having the name of the organization such as to express its functions and those along. The word "Mining" in itself would be inappropriate for investigations which form a part, only of those relating to mines and mining. With this in mind I submit herewith a draft of a joint resolution providing for the establishment of a Mining Technology Branch in the Geological Survey, the passage of which would constitute a decided gain in the expansion of the mining investigations by the federal government.

If, however, in the opinion of Congress, conditions are favorable for the realization of the proposition for an independent organization, it is my belief that the bill establishing such a bureau should provide not for a bureau of mining, but for a bureau of mining technology. I therefore submit the draft of a bill which provides for the establishment of an independent bureau to which the work now under the Technologic Branch of the Geological Survey could be transferred. Such a bureau would supplement along purely technologic lines the geologic work of the Survey in behalf of the mining industry.

In the event of the passage of the joint resolution first mentioned, my endeavor would be to so administer the added work as to promote the possibility of its ultimate establishment as an independent bureau whenever found advisable, while if the bill for the creation of a separate bureau should be enacted, the Geological Survey would co-operate with the Bureau of Mining Technology under your direction.

Very respectfully,

GEO. OTIS SMITH,

Director.

THE ENCHANTED ROD.

William Pryce, a Cornish physician, who lived in the latter part of the eighteenth century, was a firm believer in the mineral rod. There recently appeared in an English paper an account of Pryce's life and work.

It was the custom of the ancients to endeavor to procure the necessaries of life by the enchanted rod, and even to change the forms of things by the same instrument. There were many of Pryce's contemporaries who discredited the properties attributed to the rod, and he was indisposed to oppose singly the general opinion, though he was convinced of its absolute virtue—his reason being that his natural constitution of mind and body rendered him almost incapable of co-operating with its influences.

The uninitiated will be interested to learn that the enchanted rod is attracted by the metals with different degrees of strength in the following order:—(1) Gold, (2) copper, (3) Iron, (4) silver, (5) tin, (6) lead, (7) coal, (8) limestone, and springs of water. One method given by Pryce to determine the different attractions of the rod in this: Stand, holding the rod, with one foot advanced; put a guinea under that foot, and a half-penny under the other, and the rod will be drawn down; shift the pieces of money, and the rod will be drawn towards the face or backwards to the gold, which proves the gold to have the stronger attraction. By trying all the subjects of the rod in the same manner, their respective attractions in point of strength will be found to correspond, says Pryce, with the order in which he places them.

There may be a feeling abroad that the conjuring trick of the music-hall artist is an improvement on this, as he would cause the guinea pice to disappear entirely; but those who would experiment but for the likelihood of this untimely happening have no reprieve, for Pryce asserts that "it is advisable for young beginners to make no experiment, but about actual lodes, where the backs of them are known by the miners; or

else nigh the sea, where a lode being discovered they may trace it to the cliffs, and will be sure to find it.'' There is satisfaction, however, in the assurance by Pryce that a little practice by a person in earnest about it will soon give him the necessary adroitness in the use of the divining rod, and the stronger the grasp the livelier the rod moves, provided the grasp be steady and of an equal strength.

If a drawing room entertainment is cherished in the mind of the reader for pleasure and profit during the long, dreary nights of winter, it may lead to a measure of success if Pryce's naive instruction is borne in mind when operating the enchanted rod. He says: ''As our animal spirits are necessary to this process, so a man ought to hold the rod with the same indifference and inattention to, or reasoning about it or its effects, as he holds a fishing rod or a walking stick; for if the mind be occupied by doubts, reasoning, or any other operation that engages the animal spirits, it will divert their powers from being exerted in this process, in which their instrumentality is absolutely necessary; hence it is, that the rod constantly answers in the hands of peasants, women and children, who hold it simply without puzzling their minds with doubts and reasonings.''

GRAPHITE.

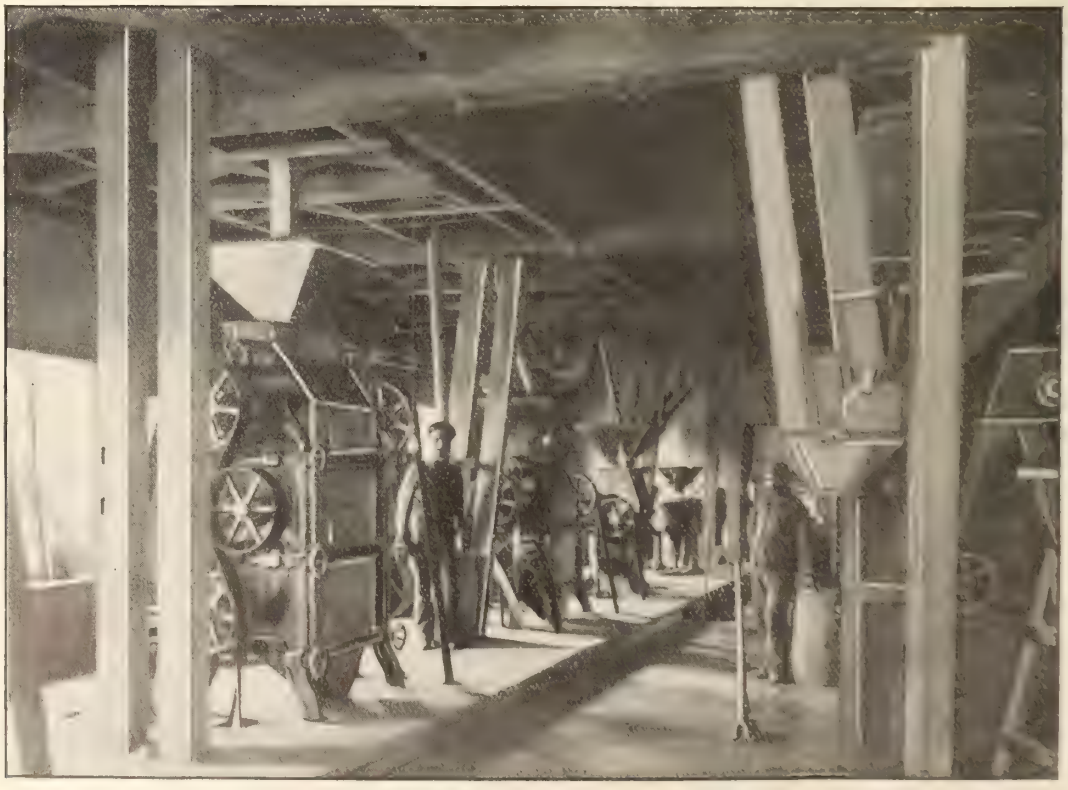
The Mines Branch, under the direction of Dr. Eugene Haanel, has issued recently a monograph on the mineral ''Graphite.'' This monograph is the work of Mr. Fritz Cirkel, of Montreal, and covers the subject from every point of view, including general information on the properties and geological occurrences of the mineral, its distribution in Canada; the mtehod and machinery used in its mining, dressing and milling. Description of the mines and dressing works of all the operating mines, the uses of the mineral in the arts, and notes on its occurrence in foreign countries. It is the fourth of a series of monographs on the economic minerals of Canada, and on account of the mass of practical information contained therein, it may be considered as a first class reference book, an aid to the practical miner, business man, and to the engineer. It is claimed that the book just issued is the only one in existence that treats the mineral from so many points of view. It is profusely illustrated, is acccompanied by 10 maps, and covers about 300 pages. In the introduction it is pointed out that on account of the great secrecy observed on the part of those who are engaged in the refining of the mineral, it has been very difficult to collect reliable data, and this might also account for the fact that there is so little published about this mineral.

Mill of the Buckingham Graphite Co.—Reconstructed by Mr. H. P. H. Brumell.

In this treatise special attention has been given to the Canadian graphite deposits, their geological occurrence, their distribution, their economic usefulness, with special reference to the different qualities of the mineral as found in this country.

Most of the graphite mines are found in the vicinity of Buckingham, Que., in the township of Buckingham and Lochabar, where now several mills of the most modern design are in operation. Investigations conducted both in the United States and abroad have demonstrated the great adaptability of the Canadian varieties for the manufacture of crucibles, and also for pencils. Canadian graphite in respect to combustibility can claim equality with the mineral now so largely used from Ceylon, while some varieties on account of their special physical qualities, and their exceedingly fine crystallization, are well adapted for the manufacture of pencils. The purity and uniformity of the crystalline, or flake, products gives the Canadian mineral first rank amongst lubricating graphites now offered in such large varieties and commanding the highest prices.

It is further stated that hitherto sufficient attention has not been paid to the exploitation of the large graphite resources, especially in the Province of Quebec. Graphite deposits lie unworked, which, as far as size, character of the occurrence, and quality of the mineral are concerned, compare very favorably with the great graphite resources of the Bohemian forests, where large



Large Outcrop of Graphite, Township of Buckingham.

well equipped mines and modern refineries are established.

Discoveries have been made in Labelle, Que., recently, and it is reported that some of these deposits, only partly developed, exhibit very large quantities of the purest mineral.

The report deals also with statistics and status of the industry, and we learn from the statistics presented that the value of the worlds total production of graphite for 1904 is placed at $4,343,691, to which Canada contributed only $23,745.

Of special interest is the chapter dealing with the qualities of graphite for commercial purposes. The author has taken great pains in going into this subject fully, consulting authorities both in the United States and abroad.

Interior View of North Elmsley Mill—Part of the Polishing Department.

Concerning the properties of graphite for pyrometric purposes, the writer says:—

1. In the application of graphite for pryometric purposes, that is as an addition to fire clay in crucibles, the quantitative determination of carbon, as well as of its components, is not essentiol. Neither a larger or smaller quantity of carbon, nor that of the admixture (to a certain degree) is an essential feature of the admixture.

2. It depends, however, primarily upon the quality of the accessory ingredients, and more particularly upon the proportion of the alumina to the fluxes.

3. The quality of the carbon, its greater or less incombustibility, is only of secondary importance. In equal or similar total proportions the quality of the carbon is decisive.

4. Chemical analysis as a rule is of the utmost importance and is in all cases a sure guide. If the analysis gives equal or compensating values, the practical criterion is the pyrometric test.

5. Both tests, the analytical as well as the pyrometric, should be made, however, in all cases for the sake of control, even if they are not always necessary. An agreement between the analytical and pyrometric results is the proof of accuracy.

For the manufacture of crucibles, it is essential that the graphite be almost free from all those components which render the latter less effective after admixture with fire clay in its resistance to high temperatures. In this connection it may be noted that graphite can be effectively replaced by retort coal or coke.

As to the adaptability of the Canadian graphite for pyrometric purposes and for the manufacture of pencils, it must be said that the highly crystalline character and the pureness of some varieties admits of its application for both purposes. Dr. Bischof, of Weisbaden, Germany, the well-known authority on fire resisting materials, has made a series of investigations with parcels of ore from the Black Donald mine, Renfrew county, and has compared them with the best Ceylon and Passau graphite, used generally in the manufacture of crucibles.

Dr. Bischoff comes to the conclusion that the Canadian flake graphite is at least equal, if not superior, to the best Ceylon graphite. This is confirmed by the investigation of Dr. Hoffman, of the Geological Survey, who has made also a number of tests with the Canadian and Ceylon varieties for the purpose of ascertaining their relative value as to combustibility.

Quite a number of experiences have also been made by the author in Nuremburg, the great centre of pencil manufacturing, with several parcels of Canadian graphite to determine its adaptability for the manufacture of pencils. These tests show without doubt that certain varieties on account of their exceedingly fine crystallization, if properly selected, produce pencils which compare favorably with some good grades made from the Bohemian graphite.

The graphite so employed by the author contained carbon ranging between 85 and 79 per cent., the carbonate of calcium and other soluble constituents having been extracted by the application of hydrochloric acid.

As Canadian flake graphite is so well known as a lubricant, it is not necessary to discuss its qualities for this application. It suffices to state that purity and uniformity of the flake, as now produced by the Canadian mill owners, give it first rank amongst the lubricating graphites now offered in such large variety. This is also shown by the fact that the Canadian article is amongst those that command at present the highest prices.

Western Drift Buckingham Graphite Company's Mine.

The subject of dressing and refining graphite has been treated as fully as possible, but the writer readily admits that this chapter, for lack of reliable data, is incomplete. Most of the graphite mill owners are reticent in giving information on the subject of refining. Indeed it must be said, that this is one of the industries on which not only is there hardly anything published, but it is difficult, if not impossible, to study the various mill schemes with the object of generalizations. Nearly every mill follows its own method, worked out and adapted to the peculiar characterissties of the ore, to meet the requirements and the exigencies of the market.

The writer therefore has confined himself to the enumeration and description of machinery for drying, crushing and concentration purposes. He has also summarized the principles upon which the separation of graphite from the gangue is based, with an outline of several mill schemes, which are in operation on the

American continent and in Europe; but he has not, for reasons just stated, gone into the description of special devices for the production of certain grades.

The book on "Graphite" will be welcomed by every practical miner, engineer and business man who has anything to do with this mineral.

The Mines Branch has spared no efforts to make this publication what it is really intended to be, viz., a reference book of the first order. Monographs of the character of the one just issued cannot but give a powerful stimulus to the development of the vast undeveloped mineral resources of the Dominion.

DETERMINATION OF MOLYBDENUM.

By J. C. Evans.[1]

The following method has for its object the determination of molybdenum in wulfenite or other ores containing lead. The procedure consists of getting the ore in solution by the proper reagents, the precipitation of the iron and lead as sulphides, the separation of molybdenum as sulphide and its molybdate, either gravimetrically. The method is detail is as follows:—

From 0.5 gram to 5.0 grams ore (depending on the amount of molybdenum contained, is attacked by hydrochloric acid; nitric acid is afterward added and the treatment with hot aqua regia continued until all soluble constituents of the ore are in solution; after one or two evaporations with nitric acid to expel all chlorides, the mixture is cooled, diluted with distilled water and a slight excess of ammonia added. Ammonia sulphide is added, drop by drop, and when all the iron, lead, etc., are converted into sulphides, a few cubic centimeters excess are added and, after stirring, the mixture is allowed to stand in a warm place until all the iron and lead sulphides have settled. It is then filtered and washed with a solution containing a slight amount of ammonia sulphide.

The precipiate is dissolved in a hot mixture of equal parts of nitric acid and bromine water, the iron and lead being reciprocated by ammonia and ammonia sulphide to insure the removal of all molybdenum. The combined filtrates, which show a deep brown color if much molybdenum is present are slightly acidified with hydrochloric acid and a rapid stream of hydrogen sulphide gas passed in for a few moments. Theoretically, the addition of hydrochloric acid alone will precipitate all the molybdenum as sulphide, but I have found that the passage of hydrogen sulphide is necessary for complete precipitation.

The molybdenum sulphide is filtered off and washed well with hot dilute hydrogen sulphide water. The precipitate is then rinsed into a No. 2 beaker and a few cubic centimeter of a hot mixture of nitric acid and bromine water poured onto the paper, receiving the acid and washings in the beaker containing the bulk of the molybdenum sulphide.

The mixture is boiled with frequent additions of bromine to oxidize the free sulphur and insure complete solution. From here one or two courses may be pursued:—

1. Gravimetric Method.—Any unoxidized sulphur is filtered and, after careful washing, ammonia is added just to neutralization, using litmus paper as an indicator. A few drops of acetic acid are added and then a slight excess of lead acetate, and the resulting lead molybdate, after stirring well and allowing to settle, is filtered through a tared Gooch crucible, or counterpoised filter paper as described by Blair[2], washed thoroughly with hot water and dried at 100 degrees C. to constant weight. The weight of the lead molybdate multiplied by 0.2614 equals weight of metallic molybdenum present, from which the percentage may be easily calculated.

2. Volumetric Method.—After the solution of the molybdenum sulphide, it is unnecessary to filter off any free sulphur present. The solution is almost neutralized with nitric acid, barely acidified with acetic acid, heated to boiling, and, while hot, titrated with a standard solution of lead acetate, using a dilute solution of tannic acid on a spot plate as an indicator. This is the well known method of molybdenum and is the exact reverse of the Alexander titration method for lead. The solution at first gives an intense yellow color when a drop of it is added to a drop of dilute tannic acid on a spot plate, and the addition of lead acetate is continued slowly until the yellow color just disappears. Knowing the standard strength of the lead acetate solution in terms of molybdenum present in the ore is easily calculated.

To prepare the solution of lead acetate, dissolve 15.70 grams of the chemical pure Merck salt (it has been my experience that other brands frequently contain chloride) in dilute acetic acid and make up to 1 liter. Twenty-five cubic centimeters of this solution is titrated against a standard solution of ammonia molybdate. The ammonium molbdate solution, having been standardized in terms of pure lead, shows the lead, contents of the of the lead acetate soultion, and the lead factor multiplied by 0.4640 gives the molybdenum value.

I have found this method more satisfactory than standardizing by means of molybdic acid, as it is very difficult to secure this reagent free from impurities, especially molybdates.

[2]"Chemical Analysis of Iron."

RESOLUTIONS OF THE ASSOCIATED BOARDS OF TRADE OF EASTERN B.C.

At the tenth annual meeting of the above association the following resolutions, amongst others, were passed unaminously:—

The resolution that a government assay office be established at Trail, adopted last year, was reiterated. The resolution also declares itself in favor of the Dominion Government purchasing gold and silver for coinage purposes at Trail in the same manner that the U. S. Government buys these metals at Seattle, Helena and elsewhere.

A resolution in favor of making relocations of mineral claims open for entry at noon on the day following the one on which rights of previous locators expire, was also passed. This is intended to stop the relocation of land and mineral claims at midnight. This was passed last year and reaffirmed this year.

A resolution was adopted stating that the railway freight tariffs, applying to the districts of Kootney and Boundary are higher than those applying to the rest of the Dominion and asking for a reduction from the railways, or, if necessary, from the Railway Commission.

Resolutions asking both the Dominion and Provincial Governments to establish experimental farms in the interior of the province were reaffirmed.

The most important resolution adopted was on the extension of the lead bounty, which is as follows:—

Resolved—That whereas: the lead bounty has, by insuring a stable minimum price, been most effective and beneficial to the lead mining industry and with it to the smelting and lead manufacturing industries, and, consequently, to the general commerce of the Dominion.

And whereas: such results have been produced by a relatively smaller expenditure than was anticipated when the original request for consideration was made to the Government, that out of $2,500,000 originally voted to be expended in the period of bounty, terminating 30th June next, but $616,976.02 has been expended up to the 1st December 1907.

And whereas: on account of the high tariff on lead ore and its products, still imposed by the United States Government (which it was anticipated might have been reduced ere this); of the recent imposition by said Government of a prohibitory duty on our zinc ores, a product of our lead bearing veins, thus deprived us of a source of revenue; and of the fact that the lead consuming capacity of Canada has not increased proportionately to our output, since the inception of the bounty, we shall, at the expiration of said bounty period, be still unable to rely on a stable minimum price for our lead, sufficient to justify its production in the form of ore, and the large expenditures on exploration and development work necessary to maintain our mines, and with them the entire lead industry of Canada;

And whereas: many of the larger lead mines of the district, either present or prospective producers, contain ore of so low a grade as to make its production impossible or improbable, during periods of low prices, it becomes necessary to extend the sliding scale, so that the bounty will be paid on lead when the price is £18, or lower, instead of £16, or lower, as at present.

Therefore, be it resolved that the Dominion Government be asked to extend the lead bounty for another period of five years, with the addition that the sliding scale be made to apply when lead is £18, or lower, instead of £16, or lower, as at present.

The next annual meeting of the Board will be held in Trail in the week following that in which the legislature meets.

GAS PRODUCER PLANTS AND GAS ENGINES.

EXPERIMENTAL WORK BY THE UNITED STATES GEOLOGICAL SURVEY.

The fuel consumed in the ordinary manufacturing plant operated by steam power yields less than 5 per cent. of its available energy in useful work. The superintendent of one of the most efficient steam plants in existence to-day estimates the total losses in a year's operation of the plant at about 90 per cent.—the utilized energy about 10 per cent. It is this wasteful consumption of our most important fuel, whose very existence, as measured by competent experts, is limited to a few hundred years, that has brought about the rapid development of one of the marvels of modern invention—the gas-producer and gas engine. It is estimated that a plant of this type, properly operated, will utilize more than 20 per cent. of the available energy in the fuel consumed.

The gas engine came into general use in the latter part of the nineteenth century, but large engines of this type have been constructed only during the last five or six years. Recent developments indicate that the replacement of steam engines by producer-gas plants is destined to be one of the two great factors in the economical production of power for manufacturing and transportation purposes—the other being centralization of power production and distribution.

For a long time the natural fuel of these internal-combustion engines was city gas, but that was too expensive except for engines of small capacity. Cheap gas was essential for the development of the engine, but the early attempts to produce it were somewhat discouraging. The theoretical possibilities of the internal-combustion engine operating on cheap fuel promised so much, however, that difficulties which semed almost insuperable have been overcome; and as a result of improvements in the production of cheap gas directly from fuel through the aid of the gas producer, the development of large-sized gas engines has been exceedingly rapid. Only seven years ago a 600-horse-power gas engine exhibited at the Paris Exposition was regarded as a wonder; to-day four cycle, twin-tandem, double-acting engines run as high as 6,000 horse-power.

In view of the possibility that the gas engine, with its gas producer, may displace the steam engine, the fuel problem became so important that the Government made special provision for producer-gas tests at its fuel-testing plant installed in connection with the Exposition at St. Louis. These tests have furnished valuable data on the relative consumption of coal per horse-power per hour when used by the steam plant and by the gas plant. By means of the producer-gas plant, which was installed in 1904, 162 tests have been made on bituminous coals, lignites, and peats from 26 States. The results of these tests, and a discussion of the present status of the producer-gas power plant in the United States, prepared by Mr. Robert Heywood Fernald, have been published by the United States Geological Survey in Bulletin No. 316, which forms Part II of "Contributions to Economic Geology, 1906."

All of the tests, whether on bituminous coal, lignite, or peat, were made in a producer of one size and type—a type designed primarily for use with anthracite coal—and with every coal that was run through the producer the results were more than satisfactory. Especially noteworthy is the fact that several low grade coals and lignites that have proved of little value or even worthless under the steam boiler gave excellent results in the gas producer.

About twenty companies in the United States are manufacturing gas producers for power purposes. At least twelve of these are fully established on a commercial basis and are in a position to give proper guarantees when installing plants, ranging in size from 20 to 6,000 horse-power, are now in operation in the United States. One company alone reports twenty-odd installations, averaging over 2,000 horse-power each, and nearly as many more, of about the same size, contracted for or now being erected. The number of installations and the persistent development has already led the National Board of Fire Underwriters to issue special rules and requirements for the "Construction, installation, and use of coal-gas producers (pressure and suction systems)." Of the total installations about two-thirds are suction plants, operating on anthracite coal, a few using charcoal. Bituminous coal is used in 15 to 20 per cent. of the plants installed, but this proportion probably covers 65 to 75 per cent. of the aggregate horse-power rating.

"The situation as a whole at the present time," says Mr. Fernald, "seems to be very favorable for the gas producer plant, not only as to cost of installation, operation and maintenance, but also as to reliability. The successful demonstration at the Government fuel-testing plant that bituminous coals, ligaites, and peats can be utilized with great economy in these plants should lead to an increase in the use of this form of power in a few years that may surpass even the most sanguine hopes of the manufacturers."

Of the centralization of power development and distribution Mr. Fernald says: "It would seem ridiculous to predict the immediate doom of the steam locomotive, yet one of the officials of the New York Central Railroad has publicly stated that within ten years, in his opinion, there will be no steam locomotives operating on the New York Central road. Already the New York Central has substituted electric for steam power on its lines from New York City to a point 40 miles from Grand Central station, and it is rumored that before long electric trains will be running on this road from New York to Buffalo . . . These rapid changes are leading to one end—the centralization of power development and distribution. Now that it is commercially possible to transmit electrical power for distances of 250 miles or more, a central plant could distribute such electric current for a distance of 500 miles—that is, for 250 miles on all sides of the plant—thus covering a circle comprising almost 200,000 square miles—an area nearly four times the size of the State of Illinois. The logical location of such plant is at or near the mines. With ten or twelve of these great central plants located at the various mining centres, the great railroads of the United States can send their trains speeding from the Atlantic to the Pacific coast; and the passengers, as well as the towns through which the trains pass, will be entirely freed form the usual annoyance of smoke and cinders, and the disastrous fires caused by sparks from locomotives will be a thing of the past."

UNITED STATES COAL MINING IN 1907.

Returns received by the Geological Survey indicate that the production of coal in the United States in 1907 amounted to between 450,000,000 and 460,000,000 short tons, an increase of about 10 per cent. over the record-breaking output of 1906.

The most signficant increase was made in the production of Pennsylvania anthracite, in which there was a gain of over 20 per cent. if the record of shipments as reported by the Bureau of Anthracite Coal Statistics may be accepted as indicative of the total production; and since the shipments amounted to more than 85 per cent. of the total production such an assumption is not unreasonable.

The shipments of anthracite in 1907 amounted to 67,109,393 long tons, against 55,698,595 long tons in 1906. This would indicate a total production for the year of appproximately 76,366,000 long tons, or 85,840,000 short tons. An interesting feature in connection with the production of anthracite in 1907, was the fact that no effect on the trade was produced by the panic that began in October and continued until the end of the year. Not only did the shipments of anthracite continue practically without interruption, but the records show that the shipments for November were larger than in any other November in the history of the trade, while those for October were the largest that have been made in any single month in the last four years. This record shows the extent to which anthracite has been eliminated from industrial uses, and indicates that pratically the entire production is consumed for domestic purposes.

Another interesting feature shown by the anthracite statistics for 1907, is the steadying influence of the policy adopted a few years ago by the coal-mining companies of discounting prices in the spring and summer months. The shipments (excluding a February of twenty-eight days) ranged from 5,249,946 long tons in January to 6,015,851 long tons in October, and the average monthly shipments were not quite 5,600,000 tons. This indicates that the mines were operated with remarkable steadiness month by month and that the transportation also was evenly distributed throughout the year.

There is no such reliable method of approximately computing the total production of bituminous coal as exists for anthracite, but letters received from a number of the larger operators and from State officials indicate that the total production of bituminous coal in 1907 exceeded that of the previous year by 7 to 10 per cent. The increases were rather unevenly distributed and were influenced by several causes. In the Eastern States where large quantities of bituminous coal are used in coke making and for other industrial purposes, the financial stress in the last three months of the year was pecularily felt, and in some districts was so pronounced that the increases recorded during the first nine months of the year were to a large extent wiped out. Had it not been for the disturbances in financial circles the production of bituminous coal in 1907 would probably have shown an increase almost comparable with the gain in anthracite production. It is almost certain that the increase in bituminous production would have amounted to 15 per cent. and that the total would have been between 390,000,000 and 400,000,000 short tons. As it is, the production will probably fall about 25,000,000 tons short of that figure.

During the first nine months of 1907 there was the same complaint of shortage of cars which has been made during the last few years, and owing also to the demand for and the high prices paid to labor in other lines of industry, there was a general scarcity of miners and other workers in the bituminous coal mining districts. AfterOctober there was a plentiful supply of both cars and labor. As compared with 1906, however, there was some improvement in transportation facilities, and those familiar with the trade realize that if a sufficient number of cars could have been furnished to meet the requirements of the producers, the production would soon have been far in excess of the demand, with the usual demoralization which such condition entails.

The coal-mining industry in both anthracite and bituminous circles was almost entirely free from labor troubles during 1907, both operators and miners, where the wage scales were signed with the union, showing a disposition to live up to contracts. An important gain made by the miners' union, known as the United Mine Workers of America, was the extension of its control to the majority of the larger producing mines in some of the States of the Rocky Mountain region. This change was effected about the first of September, at which time the hours per day in the mines which went under the union rules were reduced from 10 to 8, and in many of these mines the rate of wages was increased at the same time.

FOUR MEMORABLE DISASTERS.

In addition to the unsatisfactory conditions in the money market during the latter part of the year, the closing month was in another respect the darkest in the history of the coal-mniing industry, in that it recorded the occurrence of four separate disasters, all in the Appalachian bituminous coal field, and each attended by the sacrifice of many lives. On the first day of the month an explosion occurred at the Naomi mine of the United States Coal Company, near Pittsburg, Pa.; the second wrecked mines Nos. 6 and 8 of the Fairmont Coal Company, of Monongah, W. Va.; the third was an explosion of gas in the Yolande Coal & Coke Company's mine, at Yolande, Ala.; and the fourth wrecked the Darr mine of the Pittsburg Coal Company, near Connellsville, Pa. All of these explosions occurred within a period of three weeks, and in them between 600 and 800 lives were lost.

THE ENGINEERS' CLUB.

The Engineers' Club of Toronto invited a committee of the Toronto Branch of the Canadian Mining Institute to discuss with them the feasibility of securing and furnishing a suitable building to be used by both societies as a place of meeting. Mr. J. B. Tyrrell spoke for the Toronto members of the Canadian Mining Institute, as follows:

Mr. Chairman and Gentlemen.—

It is a great pleasure to me to have the opportunity of representing the Canadian Mining Institute here this evening, and of bringing from it to you kindliest greetings and best wishes for your welfare and success.

As engineers we are working along very similar lines. You install power plants, build bridges, railroads, tunnels, etc. We install power plants, sink shafts, drive tunnels, etc., and the principal differences between your tunnels and ours are that you must waste all the material extracted as cheaply as possible, while very often the material that is taken from our tunnels is too precious to be wasted, and must be carefully handled and stored. You want to build a tunnel that will last for all time, with just as few repairs as possible; we want to run tunnels that will last for the comparatively short time that we will need to use them, knowing that many of the arrangements necessary for great permanency would merely entail useless and unnecessary expense. You are able to lay out the plans of your tunnels before you drive them, while we may have to change our plans from day to day to suit the changing shape or conditions of the ore bodies. The mining engineer, perhaps more than any other class of engineers, must be constantly alive to the changes in the conditions that surround him, and must be always prepared to modify his plans to meet those changing conditions. However, he has one strong point in common with all other engineers, he is the man who does things, and does them along the lines that the though and practice of his predecessors through all past ages has shown to be most successful, adopting one plan here and another there as the necessities of the different parts of his enterprise may suggest to him. In his work, however, he probably deals more with raw ma extract from their hiding places in the rocks the useful ores and metals and hand them over to others to be treated in different ways, and transformed into the raw material than most of his confreres, for it is his duty to terial for other engineers.

But I wish to enter a protest against the definition of an engineer which has become rather popular within the last few months, namely, "The silent man who does things." For after all a silent man is a man but half developed. The highest class of engineer not only does things himself, but he teaches others to do things. He cannot claim to be a good citizen unless he is prepared and willing to impart to others some of the knowledge which he himself possesses. The teaching or communicating instinct is a part, and a valuable part, of our inheritance as human beings, and it cannot be ignored with impunity. Every right-minded man, be he engineer or not, feels quite plainly that this is the case, though he may not be accustomed to acknowledge it. He must impart to others something of what he knows.

Our clubs, where we are so fond of foregathering from time to time, distinctly point to the presence of this communicating instinct, for while most of us hope and expect to derive definite benefit from communion with others in these clubs, and this hope may probably be what we in this rather selfish age present to ourselves as the reason for our attendance, the real reason after all is that we have some little thing to tell to others which we would like them to hear and know, and we cannot be quite satisfied until we go and tell them. Now this Club and the Canadian Mining Institute are both formed for the purpose of enabling engineers, and those interested in engineering and mining work, to tell each other, and later as a rule the general public, some of the things that may seem interesting to the individual members. The strength of these societies depends on the mutual sympathy which the members have and show towards one another. There must be speakers as well as attentive listeners, and no man must be satisfied with occupying one role to the exclusion of the other.

In conclusion I would like to say that the Toronto Branch of the Canadian Mining Institute has had a most successful series of meetings so far this winter. They have been very fully attended, and the discussions have been animated and general, with plenty of good speeches, and many interested hearers.

I thank you, Mr. Chairman and gentlemen, on behalf of the Canadian Mining Institute, for the kind way in which you have drunk this toast.

EXCHANGES.

Mining and Scientific Press, February 1st.—In the January 4th issue of the *Mining and Scientific Press*, Mr. J. H. Curle's letter on the "Psychology of Mining Booms" appeared. Referring to thirteen mining booms of which he had had intimate knowledge, Mr. Curle remarked that after the initial excitement, outside promoters entered the field, capital poured in, and for one good mine twenty worthless ventures were floated. Then the inevitable crash and the equally inevitable loss and suffering of foolish and deluded people.

Mr. Claude Sachs, editor the *Mining Investor*, writes in the *Press* of February 1st a letter traversing Mr. Curle's statements and conclusions. Mr. Sachs attempts, cleverly enough, to justify "financial excitement, wide advertisment, speculation or optimism," as healthy and necessary concomitants of the discovery of one or two rich mines in a new district.

Mr. Sachs, as stated above, is editor of *The Mining Investor*, a weekly journal that publishes full page advertisements of mining stocks of the "get rich quick" variety. It is therefore not surprising that Mr. Sachs is

guilty of more than one sophism. His is the *argumentum ab inconvenienti.*

Mining Science, January 30th.—A convenient classification of various sizes of ore particles is given by Edwin A. Sperry in an article on slime concentration, written for *Mining Science.* "Coarse" is defined as material remaining in a screen having 30 meshes to a linear inch (0.02 inch or 0.5 m.m. open space; "sands," as material passing 30-mesh and remaining in 100-mesh (0.004 inch or 0.1 m.m. open space); "fines," as material passing 100-mesh and remaining on 200-mesh or 0.05 mm. open space); and "slimes," as material passing 200-mesh.

The Mining World, February 8th.—An article entitled "The Prevention of Coal Mine Explosions," by Carl Schulz and R. S. Moss, includes a brief analysis of the possible conditions pre-requisite to an explosive atmosphere. After reviewing the causes that "alone or combined, may create a dangerous accumulation of gas and coal dust," the writers affirm that "in all these cases prevention can be assisted only by the use of locked safety lamps, a proper degree of care, and intelligence, exercised by everyone employed in the mine."

In spite of an abundant timber supply and roofs of moderate height, by far the greatest number of accidents are due to roof falls. Carelessness and extravagant use of explosives are to be blamed for this. The practice of shooting off the solid instead of first undercutting the coal is dangerous and wasteful of powder.

Close observation points to the fact that a humid atmosphere is the best preventive of the accumulation of coal dust. Hence finely atomized water should be sprayed in the ventilating current. This accomplishes much more than mere sprinkling of the floor.

Explosions generally happen on days following the period of idleness and especially on Monday.

The Engineering Magazine, February.—In this issue of our valuable contemporary appears a review of the Nevada copper fields by Mr. A. Selwyn-Brown. Mr. Brown's outline of the geology of these districts is worthy of notice.

The copper industry of Nevada is growing with such rapidity that before long that State will rank amongst the largest producers on the continent. New plants are going up in many places, and within a few years will be enormously increased.

The most remarkable feature of the geology of Nevada is the evidence of volcanic activity everywhere visible. Volcanic sheets, intrusive dikes, ruins of volcanic craters, gigantic fissures and immense beds of sinter and volcanic ashes are the present indications of former volcanic activities. Many of the best authorities agree that one vast petrographic province, underlain by a single body of molten magma, stretches from Alaska through British Columbia, Idaho, Nevada, Arizona and Mexico, down into the Andean regions of South America.

The general sequence of lavas in Nevada is: (1) Rhyolite (Eocene). (2) Andesite (Miocene). (3) Rhyolite and basalt (Miocene-Pliocene). Andesite (Late Pliocene—early Pleistocene). (5) Basalts and occasional rhyolites (Pleistocene). Accompanying this petrographical province is a co-extensive metallographic province in which many rich ore deposits, almost identical geologically, occur. Illustrating this is the striking geological and mineralogical similarity between the ore deposits of the Comstock, Tonopah and De Lamar, and those at Guanajuato, Pachuca, and other Mexican districts.

PERSONAL AND GENERAL.

Mr. Thomas J. Drummond, of Montreal, returned early this month from an English trip.

Mr. S. G. Blaylock, formerly of the Hall Mines smelter, has gone to the St. Eugene mine at Moyie.

Mr. Harry E. Rice succeeds Mr. J. F. Kent as superintendent of mills of the Dominion Iron & Steel Company, Sydney, N.S.

Mr. W. H. Aldridge, general manager of the Canadian Consolidated Mining & Smelting Company, is visiting Toronto and Montreal.

Dr. John Galbraith, Principal of the School of Practical Science, Toronto, has been elected president of the Canadian Society of Civil Engineers.

Captain John Harris, superintendent of the McKinley-Darragh mine, has resigned. Under his management the McKinley-Darragh made notable progress.

Major Vereker is inspecting gold properties in the Manitou Lake district, and will shortly leave for England in connection with his investments there.

Mr. Alexander H. Smith, of Oaxaca, Mexico, is visiting Toronto. Mr. Smith is the manager of Los Reyes gold mine, near Oaxaca. He will remain in Toronto for some days.

Mr. G. C. Mackenzie has made an inspection of the blast furnace of the Atikokan Iron Company, Port Arthur, and their iron mine at Atikokan, for the Ontario Bureau of Mines.

Mr. J. F. Kent, formerly superintendent of the mills of the Dominion Steel Company, has severed his connection with the company. He is succeeded by Mr. Harry E. Rice.

Capt. McClelland, of Winnipeg, and Mr. Michael Ralph, of Port Arthur, have returned from an exploration trip near the shores of Lake Nepigon, where they claimed to have discovered large deposits of red hematite ore.

Mr. Louis Ernest, an engineer who was for some time engaged in developing mining properties in British Columbia, has been declared bankrupt in London, England, an examination into his affairs showing a deficiency of £2,522.

Mr. E. Jacobs, the newly appointed secretary of the Western Branch of the Canadian Mining Institute, and Editor of the British Columbia *Mining Record,* is doing good organization work in Northport, Greenwood and other Boundary points.

The death of Col. Brownell-Granger, formerly manager of the Coxheath Copper Mining Company, at Beechmont, near Sydney, N.S., occurred on the 24th of January. He was a native of Boston and had been in Sydney for about 20 years. He was 76 years of age.

Mr. Alex. Dick, it has been announced, will remain with the Dominion Coal Company as general sales agent. Mr. Dick's headquarters will be removed to Montreal. We are glad to note that Mr. Dick's services will be retained by his company. He is one of the best informed and most effective general sales agents in the business. He has made a close study of market and economic conditions both in America and Europe.

Negotiations are now in progress between the De Beers Consolidated Mines, Limited, and Premier Diamond Mining Company, looking toward a restoration of confidence in the diamond market. Profits of the Premier Company for 1907 are stated to be about £550,000. As a result of the reaction in the diamond trade about 4,500 diamond workers, or one-fourth of the total number in Amsterdam are out of employment.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay.

The new rate schedule which the Coal Company announced would go into effect on the 6th of January, became operative without giving rise to much comment, and to-day the men have received their first fortnight's pay under the new order. The Coal Company went a little further than they announced in their Schedule No. 1, and have given an increase to landing tenders and drivers as well as the general shift labor increase. The Coal Company in their reply to the Minister of Labor took exception to the application of the P.W.A. for a Board of Investigation and Conciliation under the Lemieux Act, or to give it the full title, the Industrial Disputes Act 1907, pointing out that the declaration which accompaniel the application did not state that authority had been obtained by a majority vote of the workmen to declare a strike in case the application was refused, that eighteen lodges only of the P.W.A. were interested parties to the dispute, namely the lodges of the workmen of the Dominion Coal Company affected by the new rates, whereas the application was made in the name of the P.W.A. as a whole, which was not a party to the dispute. The company also claimed that the application of the P.W.A. was a misstatement of the facts, inasmuch as it referred to decrease to certain classes under the new schedule, but omitted any reference to the compensating increases to other classes under the same schedule, and that in fact the new scheme of rates involved an aggregate increase on the Coal Company's payroll. Under these circumstances the Government refused the application as first drafted, whereupon the P.W.A. took steps towards the prepraation of another application. They held a series of meetings of all the lodges and passed a resolution declaring their intention to strike if the the application were not granted. The Minister has now decided to grant the Board of Conciliation applied for by the P.W.A., and has communicated with the Coal Company as to their choice of a representative on the Board. At the time of writing the Coal Company have not announced their nominee. This is the first time that the Lemieux Act has been called upon to deal with a serious industrial situation. Up to the present time the disputes that have been settled by the intervention of the Department of Labor have been small and comparatively easy to adjust. The present matter, however, affects not only the welfare of about 6,000 men directly connected with the Coal Company at Glace Bay, but also the neighboring City of Sydney, and further than that it will prejudicially affect the whole Dominion from Montreal to the sea, if any cessation of work takes place. It is difficult to see why any such action was necessary, as had been taken by the P.W.A. At a time when industrial conditions over the whole of this continent are under a cloud, when banking establishments whose names were a synonym of stability have gone to the wall, when the mines of the United States have been closed for want of demand, when a cycle of industrial depression appears to have set in both here and in Eurpoe, the men were offered a continuation of the rates and conditions that have proven so satisfactory during a period of three years, and to use a slang phrase "they turned it down." Not only so, but they made most impossible demands, demands in fact, the granting of which was out of the question. They asked that all miners out of places should be paid a minimum wage $2.44 per day, and that extra tonnage rates should be paid for night work, two things, that so far as we know, are not existent in any mine anywhere. The men asked for an increase to the more poorly paid common laborer, and in doing so they played largely to the gallery. Persons not acquainted with the conditions around the mines would say at first blush that such a demand was eminently reasonable, and that under the present conditions of living $1.38 was not a living wage for men with families to support. But as a matter of fact, the number of men with families to support on $1.38 was practically a negligible one, and no really able bodied man need work for that wage. The truth is that the $1.38 rate was paid to drivers, boys and old men past work, really pensioners. In addition to these classes there are always men who are willing to earn a small wage on the surface, at a comparatively light job, than to earn bigger wages underground and work harder for it. The work for which $1.38 was paid is not worth any more, and the company have shown their views on this point by refusing to raise wages for work of this kind. Instead they have raised the wages of the mechanics and the $1.65 man or the skilled underground shiftman. In Schedule No. 2, which carried with it the acceptance of a three years' contract, the company offered their men as attractive an adjustment of wages and as equitable a one as any Board of Conciliation could possibly evolve. The management of the Coal Company being cognisant of the extraordinary divergences in the scale of remuneration for different classes of work in their mines, and of the disasterous effect on their general organization that these divergences were having, took the opportunity offered to them by the action of the P.W.A., and deliberately set to work to draw up a set of rates that should abolish the inequalities existent under the old conditions, and a schedule that should fairly distribute the aggregate payroll, which the company under Schedule No. 2 were prepared to increase by about $60,000 per annum. This proposition also the men "turned down," stating that under no circumstances would they sign a contract. Quite why they should so shy at a contract after the reassuring experience of the past Three Years' Contract, is not apparent. They appear to look upon a proposal of a contract as an attempt to enslave them for a period of time, which seems a very perverse and wrongheaded way of regarding the matter. The conditions under which the Dominion Coal Company operate are peculair and not paralleled anywhere. They have a vast market, which they must defend against the encroachments of the American mines, and they have only a limited season in which to ship their coal supplies to the St. Lawrence to feed this territory. It is necessary in order to keep abreast of their orders that large sums of money should be expended on mine development and that their plans should be very carefully prepared a long time in advance. All these considerations render it not only desirable, but almost imperative, that the management of the Coal Company should seek in some way to assure themselves long seasons of settled conditions as a necessary corollary of their constant growth, and this is their principal object in asking their workmen for long term wage contracts. Looking at the matter also from the workmen's point of view it does not seem to their disadvantage that in face of a falling market and after a long wave of industrial prosperity, that seems likely to be followed by the trough of depression, they should be asked to agree to a settled three years of such favorable conditions as would be assured under Schedule No. 2. It would appear to those who have given the matter attention that the work of a Board of Investigation is superfluous, but a Board of Conciliation which performed its proper functions should not have a hard task before it. As we understand the Lemieux Act, it is in no wise an enactment call for the compulsory arbitration of trades disputes, and we do not see that any Government can pass such an enactment, but is is an enactment which provides an easy and recognized method of bringing into a dispute between employer and workmen the dispassionate influence of a third party with a view to conciliation, and conciliation only.

Glace Bay, 1st February, 1908.

The weather in Cape Breton throughout January was unseasonably mild and there was only one snowstorm of any consequence. Partly from this cause and partly owing to the steady work put

in by the men, outputs have been high. The output of the Dominion Coal Company, was 312,000 tons, which is considerably higher than anything that has ever been done before in January. The next highest January output was obtained in 1903, when the production of the collieries was 270,000 tons. In consequence of the good time worked and the increase on the Coal Company's rates the money disbursed through the payrolls will be very much larger than in previous years, which in the present depressed state of trade is very gratifying. Indications point to a continuation of the same conditions throughout Febraury.

When one contrasts this plenitude of work and wages with the conditions that obtained before the advent of Dominion Coal it must be admitted, the public grudge against all corporations notwithstanding, that the proof of the pudding is in the eating. This equalization of outputs is only obtainable by means of a wide-reaching and perfect organization, and when one thinks of the results, namely, good work, excellent wages and a reasonable selling price for coal, compared with the feasts and famines and the general undependability of things under the old regime, perhaps it may be conceded that good may come even out of Nazareth. We do not know of any other place where better and more consistently steady work the year round can be obtained by the man who wants work of this kind, than in the employment of the Dominion Coal Company and its neighbor, the Nova Scotia Steel & Coal Company. This statement is made advisedly and can be proved. Considering the tricks that nature plays us down here every winter and spring the achievement of such equalized conditions is most notable, and shows how far concentrated and skilfully directed human energy can maintain a more or less successful conflict with our northern climate.

Springhill.

The third Conciliation Board met on the 7th inst., and sat four days. Very little interest was taken in the proceedings by the workmen, and none at all by the management, no member of which attended in any capacity. Any of the workmen who had anything to say were permitted to say it without opposition. The subject brought up for discussion was first:—The Weigh Scales, second:—The schedule of Rates in mine, third:—The Stone question. The first was unnecessary. The second was impossible, and the third had been handled by a previously legally appointed Board. It must be said that the Labor Department did not show up very well in the formation of the Board, and convinced the large majority of the workmen who were sincere in their wish to reconcile the contestants, that more diplomacy ought to be used in this particular, even if a Board at the juncture was legal, or necessary, which many thought it was not. The men applied for the Board of Conciliation, and appointed as their agent R. B. Murray, a local magistrate. When the company was notified of the application by the Labor Department, the Company found that the subject of dispute, or the principal subject at least, had been decided by a previous Board. Therefore they refused to have anything to do with it, and this front they maintained. They also, of course, refused to appoint a man for the Board. The Government hereupon appointed a man. This man had refused to act on a previous Board, but under orders, consented. He met with the workmen's agent to select a Chairman, or third party. The men's agent proposed a former Chairman, but the Government appointee objected and proposed a judge of the province, and a man whose integrity, impartiality and legal ability were recognized throughout the Dominion. The men's agent objected. The Department slipped in then and appointed the nominee of the workmen's agent. Thus was the Conciliation Board brought into being. Neither the men nor management seem to lose any sleep over the probable outcome of the investigation, which lasted four days, a portion of which was conducted behind closed doors. The company as before remaked, took no part or interest in it, and appear absolutely indifferent to the ultimate finding of the Board.

The Stone Question.

This stone case is a serious one, only on account of the hold it gives the agitators on the miners who compose, after all, but a small portion of the working force. Few among the miners today but know that the question was settled years ago, and the opening up of the question could only be the result of the ignorance of strange miners, and agitators, while those amongst the miners who really knew, would naturally stand aloof ready to take advantage of any success, the agitators would meet with. The efforts of these agitators were, however, rendered nil by the evidence of men and officials who had participated in the settlement of the Stone Question 17 years ago. The consequence was the former Board decided against the workmen. But if the malcontents could not control that Board, they certainly had control of the workmen, and a strike of three months ensued, in which everybody suffered but the agitators as subsequent events seemed to prove. The men finally accepted defeat and conditions that should have rendered further Boards unnecessary. The sapient leaders did not think so, however, hence the third reference. The finding of this has just been made public.

Work in the Springhill Collieries is very steady, the mines have their full complement of men.

Labor is abundant at the mines and the people connected with the Springhill Collieries are fortunate in having steady work when hordes of men are absolutely starving or working for the bare necessaries of life, in many parts of Canada.

When will working men recognize the fact that it is sheer suicide to strike on a falling market! Here we have several of the largest coal mines in Canada, talking strike with the probability of hundreds of men being thrown out of employment in Nova Scotia, with thousands of unemployed in other sections of the Dominion, who would be only too glad to earn a tithe of the wage, with the steady work, with which these miners are favored.

The Scales.

In the case of the scales, an urgent demand by the committee of the local lodge, supposed to emanate from the body of the workmen (which it was subsequently found was not the case) was made on the management to install scales for the weighing of coal at the several bankheads. This was promptly complied with by the management now that a bona fide and apparently general request had been made. When work was resumed after the strike the workmen's checkweighmen was asked by the manager to act in conjunction with the officials, in arriving at a standard weight per box. There were some difference at the time between the checkweighmen and their employers as to extra remuneration for the increased labor and responsibility connected with the new system. This the workmen refused. From this or some other cause the checks would not act in the case. The management thereupon put on sworn weighers from another town and after 10 days work under usual conditions, they arrived at a fair and equitable standard. The modus operandi was published in the local papers, and the public, and workmen generally, were satisfied that the new method was fair.

The Schedule Case.

The request for a schedule of rates was as promptly complied with by the management as the demand for the scales. A joint meeting of the officials and a large committee composed of the officers of the P.W.A. met and drew up a schedule of existing rates, satisfactory to both parties. It was found later, however, that the committee could do nothing definite till they had consulted the lodge. The lodge members took up the matter and made up a schedule to suit themselves. This was handed back to the management for signature, and after being read over by the officials, was

found to embrace all points of former disputes, and read in favor of the men. A comparison of the schedule agreed to by the officials and committe, differed so materially with the one presented by the lodge that the management dropped the question of schedule at once, possibly for all time.

ONTARIO.

COBALT.

Silver Cross.—This property is considered one of the best prospects in the Camp, and with proper development has a good chance of proving to be a shipper. Shaft No. 2 is now down 25 feet, the vein which is smaltite, niccolite and calcite, averages 4 inches in width and carries small silver values. It is the intention of the management to sink 100 feet and cross-cut to No. 1 vein, which is located about 300 feet to the north. The property is equipped with a small plant sufficient for prospecting work.

Silver Cliff.—This property, which is the first to be added to the shippers of 1908, is suited north of and adjoining the Watts Mine on the shore of Cross Lake. On January 20th, twenty-six tons of ore were shipped. The values consist chiefly of leaf silver in the wall rock. The formation is diabase with a Keewatin contact.

Cobalt Central.—On January 30th a new ore shoot, carrying high values, was encountered 97 feet in the drift on the second level on No. 2 vein. When struck, the vein was 4 to 5 inches wide, within a few feet it widened out to about 12 inches, about 3 inches of which is smaltite, carrying approximately 2,500 ounces and the balance calcite, carrying about 200 ounces.

The concentrator continues to give very satisfactory results.

Cobalt Lake.—The vein known as the "niccolite vein" continues to show very good silver values. The vein was encountered at the 86-foot level, in a drift north from No. 4 vein. On the surface the vein was practically all niccolite, at the 86-foot level it is largely smaltite. In a raise in the east drift on this vein silver was found. The fact that high silver contents were proven on this vein is especially important as the vein averages over two feet in width.

The annual meeting of the company will be held at Toronto on February 21st.

Cleveland Cobalt.—F. L. Cody, secretary and treasury of the Rochester Cobalt Mines Company, has been made manager of this mine. 20 men are now employed on the property of the company at Clear Lake and a small force at the power house, in the town of Cobalt.

City of Cobalt.—One ton of high grade ore and one ton of low grade ore from this mine, will be sent to the Electric Smelter at Ottawa. This ore has been ground to a quarter inch mesh and sampled here. The results will be watched with great interest. The drifts at the 145 foot level are now in 26 feet each way from the shaft.

T. & H. B.—The employees at this mine were notified of a reduction in wages in December. The union applied for a Board of Investigation, which is now sitting.

Badger.—The shaft on the No. 5 vein, which is now 110 feet, will be continued on to the 150-foot level. The shaft on the No. 9 vein is down 60 feet and will be continued to the 100-foot level. This is being sunk on a good showing of smaltite. 35 men are employed.

Right of Way.—In cross cutting west, at the 75-foot level, in the No. 1 shaft, a new vein was cut at a distance of 20 feet from the shaft. This new vein is very rich indeed, carrying smaltite, niccolite and native silver. It runs parallel to the vein sunk upon.

No. 2 shaft is down 160 feet and the cross cut west, at the 85-foot level, to cut the vein, in is 65 feet.

Montreal River District.—There have been several discoveries, recently, of importance in this district. In lot 4, concession 6, James Township, all six of the Prince claims have been passed on sight.

In the Silver Lake section, six miles west of Elk Lake, four out of five of the Clinton claims have been passed on native silver discovery.

On the Downey claim, in the same section, silver was struck at 32 feet depth, in a vein of calite, bornite and chalcopyrite, about six inches wide.

Two finds of importance were made early in January in Smythe Township.

At Elk City over 150 lots have been sold and a number of substantial buildings built. Orders have been placed for 250,000 feet of lumber to be used in construction during the spring and summer.

Temagami Mining & Milling Company.—The "Big Dan" Mine, belonging to this company, at Grey, has about 35 men at work. The two shafts are each down 60 feet and a tunnel driven in on the vein is in 100 feet. The ore, which is an auriferous mispickel, is being shipped to New York for export.

Coniagas.—A shaft house will be erected shortly at the No. 2 shaft. This will be the main shaft. A self dumping skip will be installed and the ore hoisted will be dumped into a chute, which will carry it directly to the crusher at the mill. This shaft is now down 160 feet. 116 men are employed.

Trethewey.—There are four carloads of ore ready for shipment. The last lot shipped averaged 3,000 ounces to the ton. 55 men are employed.

14,500 tons of ore were shipped from Cobalt in 1907, which carried approximately 90,00,000 ounces of silver. This is 5 per cent. of the world's production, 16 per cent. of the production of the United States and 77 per cent of the production of the State of Colorado. Figuring 9,000,000 ounces at 65.3 cents, the average price for 1907, the value of the Camp's output was something over $5,877,000, considerably more than the total value of the production for the first three years in the history of the Camp.

Red Rock.—At the annual meeting, the directors voted to expend $2,00 per month on development work on the property of the company, which is situated south of and adjoining the Green Meehan.

Kerr Lake Crown Reserve.—10 tons of some of the richest ore that the Camp has produced, are ready for shipment to New Jersey.

Temiskaming.—While drifting on the main vein at the 200-foot level, a cross vein of calite and native silver was encountered. This new vein is two feet in width and carries an estimated value of 5,000 ounces to the ton.

Little Nipissing.—This company has leased from the Peterson Lake Mining Company, 10 acres on the west side of the lake adjoining the Nipissing Mine. The lease is for five years, the lessees agreeing to pay 25 per cent. royalty on all ore produced, to do 350 feet of underground development work the first year and 500 feet per year, thereafter, during the life of the lease.

O'Brien Mine.—A cheque for $7,327.75 has been paid to the Provincial Treasury for the 25 per cent. royalty for the month of December, 1907. This makes a total of $230,272, which the Province of Ontario has received from the O'Brien Mine in a little more than a year.

Silver Leaf.—A car of 31 tons of high grade ore was shipped from this mine on January 28th.

The shaft on the new vein is now down 60 feet. 33 men are employed and three drills.

There are 15 tons of high grade and 3 cars of screenings in the ore house.

McKinley-Darragh.—A small force of men are now employed at the Savage Mine, belonging to the McKingley-Darragh Savage Company. The shaft is now down 113 feet, will be sunk to 125 feet and cross cut run south. The stamp mill at the McKinley-Darragh has been closed down for the time being.

There were eight shippers in the week ending January 31st, with a total of 12 cars of ore shipped, 80 per cent. of this ore went to the Canadian smelters, practically a reversal of the average of 1907, in which year the Canadian smelters treated about 20 per cent. of the output of the camp.

In the month ending January 31st, 1,326 tons were shipped, 346 tons more than in January, 1907.

BRITISH COLUMBIA.

Boundary.

Feb. 3.—No marked advance has been made in mining in this district during the past few weeks outside of that shown by the Granby Company in the Boundary, who have gradually increased their output until they are now running their full battery of eight furnaces at the smelter and for the week ended January 31st shipped 22,011 tons of ore from the mines. Granby are now employing over 800 men at the mines and smelter, but there are still from 50 to 75 men applying at the mines daily for work. It requires two trains per day to haul the output of the Granby Mines from Phoenix to the smelter at Grand Forks; one C. P. R. train of about 32 cars and a G. N. R. train of 38 to 40 cars, and the company ships a car of blister copper to the Eastern refineries nearly every day. The recently installed electrical haulage equipment in the lower levels of the Victoria shaft is now about ready to be put into operation.

Rumors are rife in the Boundary anent the absorption of B. C. Copper and Dominion Copper interests by Granby. Color has been given this gossip by recent examinations of the holdings of these companies by Granby men. While the Granby officers maintain that there is nothing to this talk at the present time, yet to any one in touch with mining affairs in the Boundary, the move seems feasible to a degree, for it is a well known fact that the Granby Company have been making copper very much cheaper than the B. C. Copper Company, and 3 1-2 cents per pound cheaper than the last year of the Dominion Copper Company, and no doubt with proper arrangements and plans they could handle the products of the mines of these companies and make them pay well, even with copper at its present low price. But there are a great many threads that will have to be gathered up before a deal like this could be made, and unless copper remains at a very low figure for a long time it is doubtful if the thing would go through. However, it is clear that if an arrangement of this kind did come to pass it would certainly be a money making proposition for the shareholders. It is also understood that the Consolidated Company has its eye on the Dominion Copper outfit. Inasmuch as the Consolidated is now handling at its well equipped smelter at Trail, ore from the Snowshoe Mines, which is said to average 1.4 per cent. copper, $1.50 gold and 23 cents silver, it is reasonable to assume that they could handle the ore from the Sunset, Idaho and other Dominion Copper Company mines, at a profit. All of the progressive companies in this district are now extending their operations over a broad field, for instance, Granby, among other things are working in the Similkameen and at Rossland; Consolidated at Rossland, Phoenix, Trail, Moyie and the Slocan; Le Roi Two at Rossland and Slocan and so on. This is necessitated by the low grade of the gold-copper ore as it is necessary to have a higher grade ore mixed with it for fluxing purposes, and it tends to more economical operation.

Nothing was done at the annual meeting of the Dominion Copper Company, January 27th, towards resuming work and unless the price of copper, cost of coke and supplies and other factors adjust themselves nicely, it is hardly possible that B. C. Copper Company will start work right away. The net profits of the B. C. Copper Company for their last fiscal year were approximately $700,000, while those of the Dominion Copper Company were about $80,182.

The Maple Leaf group of claims, near Grand Forks, has been bonded to New York people, and work has been resumed.

Rossland.

The Consolidated Company is opening up a fine lot of ore in their Centre Star-War Eagle, Idaho and Iron Mask workings. In the lower levels of the War Eagle they have encountered ore running high in gold values, a 100 ton lot averaged $50 per ton in gold. One ore body on the 14th level has been cros cut for 65 feet and a drift from the 11th level of Centre Star into the Idaho has cut a 35 foot ore body in the latter.

At the Giant-California the development work is reaching a satisfactory stage and test shipments will shortly be made from the Old Giant ore shoot, which has been reopened. Mr. W. Y. Williams, consulting engineer for Granby, examines the workings periodically and expresses his opinion that the property will develop into a mine in good time.

At Le Roi Mine affairs have gone ahead as usual and the mine is looking very well. They are keeping the Spitzee Mine free of water pending the arrival of Mr. Carlyle, now consulting engineer. The recent discussion which the directors had in London, Eng., over their salaries has caused some comment here. It is thought that this is an unpropitious time for the directors of Le Roi to talk salary, in the first place and it is generallyl conceded that the London office is a big burden on the mine, in the second place. The directors instead of making it harder for the people at this end, should do all they can to assist in the work of making the mine pay.

The lessees of the Blue Bird Mine here, have uncovered a silver-lead ore body on that property from which a car of ore has been taken averaging $50 to the ton; the car contained 20 tons and the returns to the lessees were $45 per ton, after freight and treatment charges had been paid.

Slocan—E. Kootenay.

The Hewitt Mines, near Silverton, are planning to build another tramway to facilitate their mining, and recently shipped five cars of ore which averaged 141.6 ounces silver and 5 per cent lead. They have enough concentrating ore blocked out to keep the mil running for two years. The Vancouver, Wakefield and Standard are also shipping, and the output from Silverton district is now about 1,000 tons per week. The Eureka, emulating the example of Rambler-Cariboo and Krao are going to drive a long tunnel which will tap their ore bodies at depth and do away with pumping water. When the showing warrants it, there is no doubt but this the most economical method, where it can be practiced.

The Eva Company have completed plans to resume work on a larger scale. The Silver Cup is looking well. The Queen, Second Relief and other properties in Sheep Creek district are active. Mr. Waldie of the Queen having made a success so far of his work, it has encouraged others to put money into their properties.

Crow's Nest.

The B. C. Associated Boards of Trade, assembled at Movie, recently passed a resolution favoring the renewal of the bounty on lead. The Boards of Trade are keeping up the agitation of this laudable piece of work and delegates have been sent East to present the case to the Government in a proper manner. The

Associated Boards of Trade also recommended that the Government establish an assay office at Trail, and purchase the gold and silver for coinage purposes from the Trail Refinery." There is not much doubt but what the latter recommendation will be complied with, while the others deserve serious attention.

At the second annual meeting of the Crown C. & C. Company, held at Spokane, January 23rd, it was given out that 14 veins of coal had been uncovered on the property and that the company would be in condition to ship by September next. The Galbraith at Lundbreck is shipping from 150 to 200 tons daily. This company has some good coal, but not a very extensive working area.

Business is slack along the Crow's Nest just at present, but it is expected that shipments will be increased and other properties put back to work in the next few months. The winter being a mild one and the shut down of some of the metal mines have partly caused this condition to exist.

COAST.

A strike is reported from the Marble Bay Mine, Texada Island at a depth of 860 feet. It is said to be a rich bornite and the body seems to be extensive. Some ore carrying rich grey copper has also been uncovered.

Hon. R. G. Tatlow has introduced a bill to the House at Victoria for a uniform tax on coal products throughout the province, that seems a praiseworthy move. This would do away with anomalies existing under present conditions; for instance, the C. U. P. Coal Company is taxed 5 cents per ton on coal and 5 per cent. royalty, while there are other coal mines in the Province, the usufruct of which is enjoyed free of royalties. It seems only just and fair that all of the coal lands and their products should be taxed in a uniform manner.

[EDITOR'S NOTE.—On the last point we do not agree with our correspondent. It is an open question whether the Crow's Nest Pass land are or are not exempt from royalty. As a matter of fact the company has paid royalty for some years under protest. The matter is discussed on our editorial pages.]

ALBERTA.

COLEMAN.

At two mass meetings of the Coleman Miners' Union 2633 United Mine Workers of America, the following resolution was carried unanimously:—

Whereas, the vocation of coal mining is known to be an hazardous calling as witness the four terrible disasters which recently occurred in the United States, not to recall the immense loss of life in Fernie a few years ago and in Coleman last April when our beloved brothers were snuffed out like a candle, and

Whereas, accidents are continually occurring which maim the workers who follow coal mining, and serve to incapacitate them for thereafter earning a living, and

Whereas, many of those workers have wives and families dependent on them, who are thus left helpless and without an additional charge on their hand, and

Whereas, the unhealthiness of the occupation is beyond question, the low lights with which we are compelled to work, involving a strain that is injurious to the eyes, the confinement which impairs vitality and the unseen dangers that menace, therefore

Be it resolved, that we the members of Coleman Local 2633 U. M. W. of America in mass meeting assembled, demand of the Provincial Parliament that they take cognizance of these conditions and their attendant hardships, and mete out a small measure of justice to the workers in this most important industry of the Province, by passing at the next session of Parliament an eight-hour bank to bank law identical with the law now in force in British Columbia and a Compensation Act along the lines adopted by the Imperial Parliament, and

Be it resolved further, that copies of this resolution be forwarded to Hon. Premier Rutherford, Hon. John P. Marcellus, the Alberta Executive Trades and Labor Council, the District Board, the Fernie "Ledger" and the "Great West."

Whereas, under the present Mines Inspectors' Act, the inspector after examining the mines records his findings in a book provided for the purpose in the company's office. This arrangement prevents to a very great extent, the mine workers from being conversant with same, and

Whereas, under the existing law the visit of the Mines Inspector are times optional with him, therefore

Be it resolved, that we the members of Coleman Local 2633 U. M. W. of America in mass meeting assembled, urge upon the Provincial Parliament the necessity of amending the Mines Inspectors' Act, so that the Mine Inspector shall be compelled to visit each mine in his district, at least, once every six weeks, and post his report at the mine mouth, in the interests of the workers employed therein, and

Be it further resolved, that copies of this resolution be forwarded to Hon. Premier Rutherford, Hon. John P. Marcellus, the Alberta Executive Trades and Labor Council, the District Board, the Fernie "Ledger" and the "Great West."

Whereas, at present there is no law providing that miners shall receive dynamite or patent powders in a condition fit to use in their working places, and

Whereas, there have been many accidents owing to their being compelled, under present conditions, to thaw their own powder,

Be it resolved, that we the members of Colman Local 2633, U. M. W. of America, in mass meeting assembled, draw this to the attention of the Provincial Government, that they may see the necessity of enacting a law compelling mine operators to provide a place suitable for the storing and preparing of powder to be used where the miners may receive it for use when necessary, and

Be it further resolved, that copies of this resolution be forwarded to Hon. Premier Rutherford, Hon. John P. Marcellus, the Alberta Executive Trades and Labor Council, the District Board, the Fernie "Ledger" and the "Great West."

SASKATCHEWAN.

COALFIELDS.

John Galvin, vice-president of the United Mine Workers of America is at present in the district organizing the various coal mining camps. For some time past trouble has been brewing between the Manitoba & Saskatchewan Coal Mining Company, of Bienfait, and the organizers of the union movement. This trouble reached a climax when Senator Watson, managing director of the company ordered Vice-President Galvin, off the company's property and informed him that, he would allow no uion paid organizer on the premises. Mr. Galvin informed Senator Watson that his men were already members of the union and that if their grievances were not listened to and redress obtained, a Board of Investigation would be applied for, under the Lemieux Act.

The Manitoba & Saskatchewan Coal Commpany employ about 100 men, and are working a thick seam of lignite coal lying about 80 feet below the surface. The company has installed an up to date plant, which is designed to produce the coal as economically as possible and load it on the cars, as free from all impurities as possible.

GENERAL MINING NEWS

NOVA SCOTIA.

SPRINGHILL.—The Conciliation Board, which met to consider the trouble between the Springhill miners and the Cumberland Coal & Railway Company has decided every point in favor of the men. The company was not represented upon the Board.

Justice Patterson was chairman, Deputy Commissioner.

PORT HOOD.—An explosion occurred in the south levels of the Port Hood collieries at 7.30 a.m., on February 7th. Ten men were killed instantly. The victims were terribly disfigured. Six were natives of Cape Breton. Their namer are, Malcolm Beaton, John T. Campbell, John Lauchie Gillies, Duncan R. McDonald, Allan R. McDonald, and William McKenzie. They were all young married men. The four other victims were Bulgarians, who had been in this country but two months. The limited area affected by the explosion induces the belief that it was due to the ignition of powder and not gas. The Port Hood mines are not gaseous.

NEW BRUNSWICK.

BATHURST.—Preliminary surveys are being run between points on Bathurst harbor and the iron ore deposits of the Drummond Mines Company, near Grand Falls, on the Nipisiquit River.

There is strong probability that the company will be encouraged to erect a smelter near their property.

ONTARIO.

TORONTO.—The mining tax, put into effect last winter, by the Ontario Government, has brought $100,000 to the Provincial Treasury. No appropriation has as yet been made to encourage smelting. This, it is understood will come later.

COBALT.—Two sample cars of ore have been shipped from the City of Cobalt mine to Ottawa for experimental treatment by electric process.

At the Argyle the lake front shafts no. 5, 6 and 7, have been abandoned and a new shaft, now down 60 feet, is being sunk and timbered, in a more advantageous position.

Mr. E. L. Fraleck, superintendent of the Cobalt Lake Mining Company, in a recent report, tellls of the finding of a new vein of calcite in the cross cut parallel to No. 4 vein, and 18 feet to the south of it.

During the past month the north shaft has been timbered, and a drift run eight feet to the west. No. 4 shaft is down 164 feet, and a level station was cut at the 154-foot level.

The drift to the west is in 20 feet on the first level, the north cross cut has been driven in a total distance of 200 feet from No. 4 drift. On No. 3 vein a raise of 23 feet has been made.

The south cross cut of No. 5 shaft is in 117 feet and the north cross cut is in 117 feet.

About fifteen tons of ore were taken from vein in a month.

The Nancy Helen Mine may be the site of a stamp-mill and concentrating plant similar to that on the McKinley-Darragh.

During January La Rose shipped most of its ore to Denver; but one car was shipped to New Jersey.

The Kerr Lake branch of the T. & N. O. Railway will be completed during February. The Provincial mine will then begin shipping. The Deloro smelter will probably treat the ore.

One thirty-ton car of high grade ore and three thirty-ton cars of low grade ore were shipped during the week ending February 1st, from the Silver Queen mine. The high grade ore went to Copper Cliff, while the low grade ore went to New York. A new assay office has been erected, and is now in good working order. The smelter, which was closed down a few days for repairs, has recommenced.

MICHIPICOTEN.—Electric power was turned on at the Grace mine on Thursday, January 16th. Three Westinghouse motors of 100 h.p., 50 h.p., and 40 h.p., respectively, the first two constant speed and the third variable, all of induction type. The power is transmitted from Michipicoten Falls, a distance of five miles at a voltage of 10,000 and is transformed to 400 volts. There is also a 10 K.W. transformer which still further reduces the current to 100 volts for lighting. The Grace mill has 10 stamps dropping constantly. The Helen mine ore is being stacked at the Wa-Wa pile. The Golden Reed mine is installing three constant speed motors. The Huntingdon mill and the Merralls mill will be taken in over the ice and installed.

SAULT STE. MARIE.—The steel plant, including the bessemer, open hearth, blowing and rail mills resumed operations in all departments on Friday morning, January s31t, after a suspension of about a fortnight.

PORT ARTHUR.—The Beaver Superior Company is shipping another carload of silver ore to Denver. A stamp mill will be erected at an early date.

BRITISH COLUMBIA.

FERNIE.—The Crow's Nest Pass Coal Company has now 2,500 men on its payroll. The monthly payroll amounts to $190,000. Mr. G. G. S. Lindsey, and Mr. J. McEvoy recently visited Victoria. They are now back in Fernie.

The output of coke is holding steady at over 800 tons daily. This is slightly less than the normal figure. It is probable that no increase will be effected for a few months.

The Fernie "Free Press" traverses severely the action of the British Columbia Legislature in increasing the tax on coal and coke. It alludes to the inopportuness of the present time and to the fact that capital will be deterred from entering the Province. The tax will, it is pointed out, not only discourage coal development, but will fall most heavily upon the smelters. Hence the metalliferous mines will suffer ultimately. The increased cost of fuel will tend to affect the reduction in wages consented to by the workmen of late. The tax is opposed universally by operators and workmen.

HOSMER.—At the Hosmer mines an expenditure of $2,000,000 is being incurred in the erection of 200 coke ovens and a large tipple.

ROSSLAND.—Mr. W. Y. Williams, consulting engineer for the California-Giant Company, left Rossland on January 27th, for Boundary. Mr. Williams reports that the ore-bodies in the Annie, owned by Le Roi Two, have been opened to the east end of line of the California. The tunnel in the California is being extended towords these bodies. The 200 foot shaft, near the portal of the California, is to be deepened. The old ore shoot on the Giant has been reopened and trial shipment are being made.

PHOENIX.—From the date of the blowing in of the Granby furnaces up to the end of January, about 60,000 tons of ore were treated. The full complement of eight will be in operation throughout February. The mines are working up to capacity. The Victoria shaft, where an extensive trolley system has been installed, is now producing ore regularly.

ATLIN.—The Fourth of July and the Beavis mine are being actively developed. On the latter the main shaft is down one hundred feet.

NELSON.—A committee of the city council of Nelson recommended that the city construct a high voltage transmission line along a course marked by the city electrician at a cost, not to exceed $3,500, from the city to the Canadian Zinc Company's plant Mile Point. The Canada Zinc Company is to pay 10 per cent. annually on the cost of construction of the line and to contract with the city for the light and motor load at the plant and also for the smelter load as soon as the city was in a position to supply it.

The shipments for the week ending January 25th show an improvement for the Boundary district. It is not decided yet as to when the B. C. & Dominion Copper Companies will resume work. Rossland is shipping normally although Le Roi is slacking a bit.

Slocan shipments are large. Some ore run last year is being sent down by rawhide. The Arlington and Emerald of the Yuni district are shipping better. Silverton is doing well.

ROSSLAND.—From the report issued to the stockholders of Le Roi Two, Limited, the following regarding the November operations is taken: During the month 2,500 tons (approximately) were shipped. The west Poorman tunnel was advanced 58.5 feet. The ore looked very promising during the greater part of the month, but toward the last it became a little poorer. The average assay has been .37 ounces gold and 6.9 per cent. copper, over an average width of 2 feet 1 inch. The west Josie tunnel has been advanced a distance of 28.3 feet, but some very good ore has been met with. The average assay has been .58 ounce gold and 5 per cent. copper, over an average width of 1 foot 6 inches. On the Hamilton vein on the 300 foot level the main dirve westward was connected with the more westerly portion during the month, and met with ore averaging .62 ounces and 3.7 per cent. copper, over a width of 1 foot 11 inches. The distance driven was 40.9 feet. 300 A Stope, 300: The average assay met with here during the month has been .77 ounce gold and 1.7 per cent. copper, over an average width of 17 inches. No. 40 stope, 300: The average assay met with has been .63 ounce gold and 3.5 per cent. copper, over an average width of 1 foot 7 inches. No. 32 stope: This stope is turning out splendidly, yielding, as it does, both a good tonnage and a good grade. We have not started to draw very heavily from it as yet, however. The average assay of samples taken during the month has been .86 ounce gold and 5.6 per cent. copper, over an average width of 5 feet 4 inches. East Hamilton stope, 500: The larger portion of the work this month has been in the easterly end of this stope, east of the porphyry dike, where a little ore was originally left. The average assay met with here has been 1.82 ounce gold and 3.9 per cent. copper over an average width of 16 inches. In the western end of this stope work has been confined to the medium grade ore, and very little high grade ore has been broken down. The average assay has been .39 ounce gold and 2.4 per cent. copper, over an average width of 2 feet 10 inches. West Hamilton stope, 500: Some excellent ore has been broken down here during the month, the average assay being 2.61 ounce gold and .6 per cent copper, over an average width of 1 foot 10 inches.

At the Vancouver mine during the month of November, 1,839 tons of ore was treated in the concentrating mill, producing 112 tons of lead concentrates and 176 tons of zinc concentrates. The lead concentrates assayed 125.1 ounce silver, 62.1 per cent. lead and 10.3 per cent zinc. The zinc concentrates assayed 40.5 ounce silver, 2.3 per cent. lead and 44.7 per cent. zinc.

MOYIE.—At the tenth annual convention of the Associated Boards of Trade, of Eastern British Columbia, held at Moyie on January 22nd, many delegates from surrounding towns were present. The Moyie Miners' Union very generously put their hall at the disposal of the Convention. President Campbell, of the Moyie Board, reveiwed the mining and metallurgical condition and the metal market for the past year. Among those present were Mr. R. R. Hadley, of the Dominion Department of Mines.

VANCOUVER.—The report of a cave-in at No. 2 tunnel of the Nicola Valley Coal & Coke Company, Limited, has been officially contradicted. No. 2 tunnel is in excellent shape. It is now 1,200 feet in length and is working three shifts.

A stampede of prospectors is taking place to the confluence of the Ingenia and Findlay Rivers, under way between the Canadian Rockies and the Cassiar Mountains. Rumors of rich gold deposits are the cause.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

A table of fatal mine accidents in 1907, issued by the Government shows a total of 1,239 deaths from accidents in coal mines, an increase of 97 over 1906. Of these 572 were due to falls of the roof or sides. Deaths from accidents in metalliferous mines numbered 34, and in quarries 89, the figures in both cases showing slight reductions over those of 1906.

The iron anad steel exports of the United Kingdom (not including iron ore, scrap iron and steel, implements, machinery and strips) in 1907 was £46,661,848, compared with £39,840,595 in 1906. Imports under the same heading were valued at £7,215,179, as against £7,215,179, as against £8,359,752 in 1906.

The iron mining industry at Watchet, Sommersetshire, closed down in 1884, is being resumed. A syndicate has been formed for working the Brendon Hills, which contain large quantities of iron ore, and the disused railway is being put in working order.

GERMANY.

In order to lessen the danger of explosions and disasters in coal mines, investigations have been extensively carried on by the Government as to mining conditions, the results of which will be laid before the Reichstag. Efforts are being made to ascertain how far stricter regulations of ventilation can avert the danger from fire damp and other causes. Drastic measures have been taken in some cases, one mine in South Germany being compelled to make alterations, costing $125,000.

The discovery of an important deposit of coal is reported from Ruckmansdorf, near Leipzig.

BELGIUM.

The production of pig iron last year was 1,427,640 tons, as against 1,431,460 tons in 1906.

RUSSIA.

Work in the production of manganese in the Tchiatin manganese area has to a great extent ceased. The exportation of the ore has declined and many hands have been thrown out of work.

Contractors for coring for petroleum at Baku, in the Caucasus, employing about 8,000 men, have formed a syndicate and nearly

doubled their charges, at the same time considerably reducing wages. The syndicate is strongly organized and attempts to strike have turned out failures.

About the beginning of 1909, it is proposed to hold in St. Peterburg an international exhibition of preventive measures against accidents and fires adopted in factories and mines. All branches of mine sanitation and hygiene will be included.

SOUTH AFRICA.

The report of the Transvaal Mining Department for the ending June 30th, 1907, gives the output of coal for the fiscal year at 2,912,083 tons, value, £796,361, as against 2,751,136 tons, value, £837,176, for the previous year. The number of employees was 10,885, of whom 498 were whites and 10,387 colored.

The stope drill trials for a valuable trophy, given by the "South African Mines" newspaper, at Johannesburg, which aroused great interest, took place during December and resulted in a victory for the Gordon drilll. Messrs. Eckstein are installin 200 of these drills. Twenty-five drills worked by 4 whites and 25 natives are being started at the Crown Deep mine. The success of these drills is expected to lessen greatly the difficulties presented by the labor problem.

The discovery of a promising zinc deposit, at Nkandala, Zululand, is reported. Specimens show zincblende, carrying a large percentage of bornite. The natural facilities for exportation are excellent.

Work has been started on the Usutu Tin mines, Swaziland.

AUSTRALASIA.

The Tasmanian Government has voted £2,000 for the exploration of the mineral belt back of Lyell, along the route of the Great Western Railway.

Recent developments at the copper mines, at Mount Lyell, Tasmania, indicate that the ore bodies extend downwards to the 1,000 foot level.

On the Macquarie River, near Stuart Town, new South Wales, the Enterprise Syndicate dredger recently made a record by obtaining a return of 172 ounce of gold for 124 hours work. The syndicate owns property on the river sufficient to keep the dredge working 20 years.

The gold production of Australasia for 1907 was 3,090,621 ounces of fine gold, as compared with 3,416,464 ounces for 1906. Of this, the Commonwealth of Australia produced 2,582,413 ounces and New Zealand, 508,208 ounces.

UNITED STATES.

An independent smelter will shortly be erected at, or near, Helena, by the mine-owners of Montana. A large amount has been subscribed by the Mine-Owners Organization. The plant will have an initial capacity of 500 tons every 24 hours.

Capt. J. W. Boyd, who located the famous United Verde copper mine, recently died in Prescott, Ariz, aged 86. The mine which he sold for a few hundred dollars is the second richest in the United States and has paid over $25,000,000,000 in dividends. Boyd died penniless.

The Bullion King Mining Company operating in San Juan Country, Colo., has struck an ore body 12 feet in width, 206 feet from the surface and covering lead, silver and gold in the neighborhood of $100 to the ton.

The Stoddart Mines Company is expending $300,000 on development and improvement on the Binghampton mine, near Humboldt, Ariz. A 500 ton smelter will be built.

The Copper Queen Company, of Bisbee, Ariz., did 5,600 feet of development work during December. They have also increased the capacity of their smelter at Douglas by one furnace and one conveitor.

MEXICO.

Chas. M. Schwab and Malcolm MacDonald, of Tonapah, Nev., and associates are acquiring extensive mining properities of Santa Eulalia. The price is stated to be $6,000,000.

The Peregrino, Pinguico & Mexican Milling Companies, known as the Bryant concerns, operating in Chihuahua are producing $500,000 per month, the monthly profits being upwards of $200,000. The Pinguico is treating 200 tons daily. The Mexican Miling Company recently started work on its projected mineral belt railroad.

COMPANY NOTES.

The International Coal & Coke Company has declared the regularly quaterly divident of 2 per cent., payable February 1st.

The annual meeting of the Dominion Coal Company will be held in Montreal on March 6th. Books close February 21st to March 6th.

Montreal shareholders of the Cobalt Lake Mining Company have appointed Messrs. Marchand and Pratt to represent them at the annual meeting.

At the annual meeting of the Dominion Copper Company, held at Phoenix, B.C., to-day. Mr. M. M. Johnson was elected a director to succeed Mr. A. M. Wickwill.

The American Smelting & Refining Company has posted notices announcing a reduction in wages commencing February 11th. The reduction affects 700 men and ranges from 10 to 20 cents per day.

The Sullivan Machinery Company announces that Mr. George M. Bertram, for several years connected with this company, is appointed local manager of its Joplin, Missouri, branch office, succeeding Mr. Randolph D. Talmage. The company bespeaks for Mr. Bertram the same courtsey from patrons and friends which has been accorded in the past to its other representatives.

The recond annual stockholders' meeting of the Crown Coal & Coke Company, whose coal lands are in the Crow's Nest district, was held, late in January, at the general offices of the company in Spokane. Within a distance of two and one half miles 14 veins have been opened. A tipple of a capacity of 2,000 tons per diem will soon be under construction. By next autumn the company hopes to be shipping 1,000 tons daily.

The following directors were elected for the ensuing year: C. L. Butterfield, Moscow, Idaho; F. L. Farrel, Wilwaukee, Wis.; R. G. Belden, A. E. Wayland, J. H. Hemphill and F. H. Mason, of Spokane; J. T. Nevin, Pittsburgh, Pa., and I. A. Barnes, Minneapolis, Minn., who in turn elected as officers C. L. Butterfield, president; F. L. Farrel, first vice-president; R. G. Belden, second vice-president and general manager, and A. E. Wayland secretary-treasurer.

At the annual meeting of the shareholders of the Silbert Mining Company the report of the president showed that the company was capitalized at $2,000,000, in one dollar shares, of which 1,000,000 shares remained in the treasury. The property consists of 40 acres, and includes the old Silver City and the Albert claims. The plant is worth $1,600 and the building is valued at about $1,000. Several shafts have been sunk to depths varying from eight to eighty feet deep, but no pay ore has been encountered. The directors intend to sell sufficient stock to continue development work, principally in sinking on the 80-foot shaft. Mr. Geo. Stevenson was re-elected president of the company.

At the annual meeting of the Erie Cobalt Silver Mining Company, Limited, held in the company's office, 5 King street west, Mr. J. H. Jewell, the president occupied the chair. There was spent the past year on development work and operation $49,000. The value of the ore pile is estimated at between $50,000 and $60,000. Additional new plant is to be installed. The shareholders unanimously adopted the report of the company, which still has half it capital stock. Mr. Neil R. Macdonald, manager of the proposal to buy a concentrator, said it would be advisable to wait six months before commencing to figure on one, as there are several different makes, either in operation or under construction, at the present time, and he wished the shareholders to have the benefit of the trials.

STATISTICS AND RETURNS.

According to the estimates of L. Vogelstein & Company, 100 Broadway, New York, the German consumption of foreign copper for the year 1907 was as follows:

Imports	128,006 tons
Exports	8,454 tons
Consumption	119,552 tons

During 1906 the corresponding figure was 119,555 tons.

Of this quantity 103,530 tons were imported from the United States.

The production of coke and pig iron continued to fall off in volume, the January output being only, according *The Iron Age*, 1,045,525 tons, compared with 1,234,279 tons in December, 1,828,125 tons in November and 2,336,972 tons in October. The most rapid restriction took place during that period with the steel furnaces, which fell off from 1,514,000 tons in October to 660,000 tons in January. Merchant furnaces cut down their production more gradually, dropping from 822,000 tons in October to 744,000 tons in November, to 575,000 tons in December and 407,000 tons in January. Even then they have quite generally increased their stocks on hand, to judge from partial reports. Recently there has been some blowing in on the part of steel works furnaces, while merchant stacks have been blowing out. The result is that there were active on February 1 142 furnaces, with a capacity of 241,925 tons, as compared with 151 furnaces on January 1, with 235,152 weekly capacity.

The output for the collieries of the Crow's Nest Pass Coal Company for the week ending February 7th was 20,431 tons, or a daily average of 3,405 tons. For the corresponding week of last year the output was 13,693 tons, a daily average of 2,315 tons.

Shipments from the Springhill Collieries of the Cumberland Railway & Coal Company for January were 37,015 tons.

Dominion Coal Company outputs for January, 1908:—

Dominion No. 1 Colliery	44,087
Dominion No. 2 Colliery	61,826
Dominion No. 3 Colliery	30,044
Dominion No. 4 Colliery	42,158
Dominion No. 5 Colliery	50,524
Dominion No. 6 Colliery	20,661
Dominion No. 7 Colliery	6,938
Dominion No. 8 Colliery	13,999
Dominion No. 9 Colliery	31,389
Dominion No. 10 Colliery	10,732
Total	312,358 tons

British Columbia shipments for week ending February 1st are as follows:

District.	Week. Tons.	Year. Tons.
Boundary	22,011	69,332
Rossland	5,945	28,312
Slocan-Kootenay	3,052	14,418
Totals	31,008	112,062

B. C. SHIPMENTS WEEK ENDING JANUARY 25.

Nelson, B.C.—Shipments from the mines and receipts at the smelters of Southeastern British Columbia districts this past week and year to date were as follows:—

District.	Week.	Year.
Boundary	18,075	47,321
Rossland	5,394	22,347
East of Columbia River	3,039	11,000
Totals	26,508	80,668
Smelter receipts—		
Grand Forks	18,075	47,321
Trail	5,141	19,975
North Portal	1,629	7,030
Marysville	675	2,355
Totals	25,520	76,681

The revenue of the province of Ontario from the mining tax last year, it is said, was between $90,000 and $100,000.

Following are the shipments from Cobalt camp for the week ended February 1st:

	Tons.
Buffalo	110,750
Cobalt Lake	50,800
Foster	68,600
LaRose	40,000
Nipissing	59,290
O'Brien	256,370
Standard	39,730
Silver Queen	243,000
Silver Cliff	52,000
Silver Leaf	62,000
Temiskaming	59,400
Temiskaming & H. B.	66,000

The total shipments for the week were 743,900 pounds, or 371 tons. The total shipments from January 1 to date are 2,651,750 pounds, or 1,325 tons.

The Dominion Steel Company received no less than $1,223,202 in bounties in 1907, getting $313,500 on pig iron, $497,212 on steel, and $412,417 on wire rods.

This was far and away the largest amount paid, the Algoma Steel Company coming second, with $556,268.

The bounties paid the various concerns were as follows:—

	On pig iron.	On steel.
Dominion Steel	$313,573.42	$497,212.07
Hamilton Iron	121,422.26	102,124.04
N. S. Steel & Coal	63,343.25	115,867.08
Can. Iron Furn. Co.	13,850.09	.....
Can. Iron Fur. Co. (Midland)	32,577.79	.....
John McDougall & Co.	5,200.92	.....
Londonderry Iron & Mfg. Co., Ltd.	43,534.61	.....
Algoma Steel Co., Ltd.	177,570.16	378,698.73
Deseronto Iron Co., Ltd.	4,487.00	.....
Atikokan Iron Co., Ltd.	17,210.46	.....
Elec. Reduc. Co.	235.20	.....
Lake Superior Iron & Steel Co.	.....	5,719.68
Ont. Iron & Steel Co.	.....	251.77
Totals	$793,005.27	$1,099,873.37

COBALT ORE SHIPMENTS.

Following are the weekly shipments from Cobalt Camp, and those from January 1 to date:—

	Week ending Jan. 25. Ore in lbs.	Since Jan. 1 Ore in lbs.
Coniagas	66,470	133,490
Buffalo	.....	63,000
Foster	40,000	40,000
La Rose	300,000	596,000
McKinley	120,000	120,000
Nipissing	64,000	250,290
Nova Scotia	.....	40,790
O'Brien	.....	120,000
Kerr Lake	39,980	39,980
Watts	.....	64,780
Standard	39,730	39,730
Silver Queen	243,000	243,000
Silver Cliff	52,000	52,000
Townsite	.....	45,100
Temiskaming	59,400	59,400

The shipments for the week were 984,600 pounds, or 492 tons. The total shipments from January 1 to date are 1,907,850 pounds, or 953 tons. The total shipments for the year 1907 were 28,081,010 pounds, or 14,040 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2.144 tons, valued at $1,473,196; in 1906, 5.129 tons, valued at $3,900,000. The estimated value of the ore shipments for 1907 are between $10,000,000 and $12,000,000.

The Dominion Coal Company made a record for January, the output being 314,322 tons, against 269,000 tons during the same month last year, an increase of 45,232 tons.

For the month of January the Dominion Iron & Steel Company is able to announce new records in every department of the plant in operation. This will be gratifying to all interested in the big Sydney industry. The following are the details of the output of the various departments for the month:—

	Tons.
Coke	40,608
Pig iron	29,320
Ingots	26,245
Blooms	23,594
Rails	18,182

The shipments aggregate within a few tons of 2,000, which, though not a record, is above the average for the winter months. On several days during the month, the production in the various departments was considerably higher than the average for the month, and, on this the officials base their belief that higher records are in store for future months.

The first announcement of record-breaking output this year was made on January 2nd, when the blast furnaces produced 1,027 tons, and this was followed on the 7th by another record in the same department of 1,135 tons.

The open hearths' first January record was 1,116 tons, made on January 23rd, and this was further increased to 1,169 tons on January 31st, the highest in the history of the plant.

Cobalt shipments were, for week ending Saturday, January 25, as follows: La Rose, 5 cars, 150 tons; McKinley, 2 cars, 60 tons; Queen, 4 cars, 121 tons; Foster, 1 cars, 20 tons; Temiskaming, 1 car, 30 tons; Nipissing, 1 car, 32 tons; Coniagas, 1 car, 33 tons; Silver Cliff, 1 car, 26 tons; Central, 1 car, 20 tons.

The total copper production of the world is estimated at 720,000 tons in 1907, as against 712,000 tons in 1906, and 708,000 tons in 1905. Output of the United States declined 10,000 tons; that of other countries has advanced about 18,000 tons.

Catalogues and Other Publications Received.

Bulletin 102, December, 1907, issued by the John McDougall Caledonian Iron Works Company, Limited, of Montreal, describes five installations in Canada of the Worthington multi-stage turbine pump. At Trail, B.C., the Consolidated Mining & Smelting Company operate a three-stage 6-inch horizontal Worthington pump, capacity 1,250,000 gallons in 24 hours against 150 pounds pressure. It is belted to a 100 horse-power induction motor. At a Montreal pumping station a three-stage 14-inch pump, of a capacity of 5,000,000 gallons in 24 hours against 110 pounds pressure is in use.

"Lifting Magnets" is the title of a most artistically done catalogue, received from the Electric Controller & Supply Company, of Cleveland, Ohio. This company's Type "S" magnet, brought out in 1905, was the first magnet designed to handle pige iron, steel and iron scrap, castings, rails and other miscellaneous magnetic material. The Type "S" magnet saves labor in handling melting stock for open-hearth furnaces, for loading and unloading pig iron for foundry purposes, etc., etc., and especially in moving all varieties of heavy and light scraps. Among Canadian users of these magnets are the Grand Trunk Railway, and the Nova Scotia Steel Company.

MARKET NOTES.

Silver.—January 23rd, 55 3-4; January 24th, 55 3-8; January 25th, 55 1-2; January 27th, 55 7-8; January 28th, 55 3-8; January 29th, 55 1-2; January 30th, 55 3-8; January 31st, 55 1-4; February 1st, 55 1-2; February 3rd, 55 1-2; February 4th, 55 1-2; February 5th, 55 1-4.

MINERALS
And How They Occur

A Book for Secondary Schools and Prospectors

BY

WILLET G. MILLER

Provincial Geologist of Ontario; formerly Professor of Geology in the School of Mining, Queen's University, Kingston, Canada

252 pages; price $1.00; post paid. Boards

Dr. Miller's text-book, now in its third edition, has undoubtedly met the requirements of prospectors and students. It is simple in diction, and logical in plan. It comprises exactly the information needed by the beginner and, because of its clearness and simplicity, it is distinctly of value to all classes of mining men.

"Minerals and How They Occur" can be obtained from the Canadian Mining Journal

For Churches and Schools

Just one Ceiling is ideal for churches and schools, for its beauty, cleanliness, economy—for its sanitary perfection (no seams to catch dirt)—for its fire-proof qualities

PEDLAR ART STEEL CEILINGS

Above 2,000 modern designs in every style of good art—side-walls to match in harmony with interior schemes—adapted to any color-scheme or architectural motive. Allow us to send you illustrated details and quote prices. Address 209

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

J. A. JOHNSTON, SUDBURY.

COAL MINING

A gentleman with considerable experience in both flat and pitching veins, and handling of large numbers of men; also holding first-class English and British Columbia, also Alberta Certificates, seeks situation as general Manager or superintendent. Highest references from present employers.

Apply, ENERGETIC, CANADIAN MINING JOURNAL.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class - $80.00 to $500.00
2nd " - - 45.00 and 47.50
3rd " - - - - - 28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $1 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch. If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers kindly mention this Journal.

Dominion of Canada

Synopsis of Canadian North-West Mining Regulatons

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

A Useful Catalogue

HAVE you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of ou "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our New Spring Catalogue will be ready for mailing March 1. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. The new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of advantageous information for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

It will include "Specials" for mining men, prospectors, and all who have heavy work to do or rough journeys to make.

CORLISS STRAIGHT LINE COMPRESSORS

FOR ECONOMICAL SERVICE

The Sullivan "Class WC" Corliss Tandem Compound Steam and Two Air Compressor, here shown, is designed to supply the demand for a compressor of the highest grade and of moderate capacity. This machine is furnished in sizes from 900 to 2500 cubic feet of free air per minute, and embodies the following advantages:

(1) It is equipped with full Corliss valve gear on both high and low pressure steam cylinders, which reduces its consumption of fuel to that of the best class of Corliss Cross Compound Compressors.
(2) It is much lighter than a cross compound compressor, thus lowering the charges for transportation and foundations.
(3) It is more compact aud contains fewer working parts; hence, costs less for maintenance.
(4) Its mechanical efficiency places it in the first rank of air compressing machines, and it performs satisfactorily all the functions of a heavier, more complicated and more expensive compressor..

The Mining Manual

For 1908

By WALTER R. SKINNER

Contains all the latest information up to within a few days of publication. The Standard Reference Work on Mines. 1,600 pages. In demy 8vo, cloth. Price 21/-, post free.

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1908 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

THE BRITISH COLUMBIA UNIVERSITY BILL.

Last summer Dr. J. Bonsall Porter, representing McGill University, brought before the Province of British Columbia the question of establishing a Provincial University. The aid of McGill was offered; but it was carefully explained that this aid was tendered unconditionally. Dr. Porter outlined a plan that met with hearty approval. "For years," he remarked, "it has been our policy to promote and unify advanced teaching in the East as well as in the West, by affiliating local institutions whenever possible, and thus establishing standards which could scarcely be maintained by separate and weaker bodies . . . Whenever you are in a position to get on without help we shall quite contentedly drop out."

The Hon. Dr. Young, who is responsible for the Bill, in a lucid and well-balanced speech moved its second reading recently. After removing any misapprehension as to the attitude of the University of McGill, he stated that the Universities of Toronto and Queen's were entirely in accord with the movement.

The provisions of the University Bill are statesmanlike in tone. The governing body is to be chosen thus:

"The first convocation of the University shall consist of all graduates of any university in His Majesty's Dominions who are actually residing in the Province two years prior to the date fixed for the first meeting of convocation, and who at least six weeks prior to the said date register themselves as members of such convocation, as hereinafter provided:

"Twenty-five members to be selected by the Lieutenant-Governor in Council and appointed for the first convocation only.

"After the first convocation, all convocations shall be composed of the Chancellor, the Senate, the members of the first convocation, and all persons who shall have become graduates of the University."

Clauses 21 and 22 provide thus:

"There shall be and there is hereby constituted a Board of Management for the University, under the name of the Board of Governors of the University of British Columbia.

"The Board shall consist of the Chancellor, who shall be chairman thereof, and the President of the University, both of whom shall be, ex-officio, members thereof, and nine persons appointed by the Lieutenant-Governor in Council."

The proposed University is to be strictly non-sectarian. Tuition in the department of the Faculty of Arts is to be free. The University will work in conjunction with the Mining School, the Normal Schools and the High School systems. Night Schools are also to be established.

In brief, the Hon. Dr. Young's scheme is comprehensive and effective.

British Columbia should be grateful to the gentlemen whose patriotic zeal has inspired this movement. Particularly are the disinterested efforts of McGill's representative, Dr. Porter, to be commended.

There has been adopted in Nova Scotia a systematic scheme of technical instruction. Ontario is awakening to the need of more complete arrangements for such education. The Federal Government is considering the advisability of appointing a commission to visit foreign countries and report upon their systems of trades schools and technical colleges. The technical colleges of the East are full to overflowing. Many of their best students come from British Columbia.

All of these considerations lend force to the conviction that no time could be more opportune than the present for the establishment of the proposed University of British Columbia.

Here we wish to make one urgent recommendation. If the proposed University is created, it will be wise for British Columbia to develop first the technical branches of instruction. The mining industry is the bone and sinew of the Province, and no truer way of insuring the wise development and conservation of her mineral resources can be devised than by that of training the sons of British Columbia in the sciences of mining engineering, metallurgy and geology. The arts and the humanities may come later.

Also it would be ungracious to refuse the proferred aid of McGill. The high traditions and standards of that University will be of tremendous assistance to the new and traditionless foundation.

It is our earnest hope that but a short time will elapse ere the University of British Columbia becomes an accomplished fact.

CANADIAN MINING INSTITUTE.

The tenth annual general meeting of the Canadian Mining Institute will be held at the Russell House, Ottawa, on Wednesday, Thursday and Friday, March 4th, 5th and 6th.

On Wednesday, March 5th, at 10 a.m., the proceedings will be opened by His Excellency the Governor-General, who has kindly consented to welcome and address the members. If necessary both the morning and afternoon sessions of Wednesday will be devoted to the transaction of business affairs. The Council's report will be read; the treasurer's statement received; and the changes in by-laws determined. At this session, also, the results of the election of officers and members of Council will be announced. On Wednesday evening and at the Thursday and Friday sessions, papers will be read. The annual dinner will be held on Friday evening at 8 o'clock.

GEOLOGY.

In a series of lectures in the course in Science, Philosophy and Art, delivered during the session 1907-1908 at Columbia University, Professor J. F. Kemp spoke on geology. His address is one of unusual excellence. Glancing briefly over the nebular hypothesis, he touches upon the alternative conception formulated by Professor T. C. Chamberlin, of Chicago, whose hypothesis is styled the "Planetesimal Hypothesis." Continuing his survey of the scope of geology, Professor Kemp alludes to a matter that is of signal interest to Canadians. He speaks in terms of high appreciation of the brilliant work of Dr. F. D. Adams, of McGill University, who, with the aid of elaborate and expensive apparatus, succeeded in demonstrating that, under proper conditions, marble could be made to flow like wax, under a strain far beyond the limit of its crushing resistance. Professor Kemp refers to the experiments now being carried on by Dr. Adams upon rocks such as granite, and under burial and metamorprhism. "In so far as these have yet gone," writes Professor Kemp, "they are a striking corroboration of the conclusions reached by observers in the field, among whom Professor Adams also occupies a most honorable place."

THE CONSULTING MINING ENGINEER.

One of the best and clearest expositions of the functions of the consulting mining engineer appeared in a recent number of the *Engineer and Mining Journal*. The article referred to is reprinted on another page of The Canadian Mining Journal.

There are two principal causes of loss and waste in mining investments. The fever of a mining boom hatches a host of fakirs whose object is to milk small investors of sums insignificant in themselves but often aggregating hundreds of thousands of dollars. The success of these schemes depends upon the ignorance of those to whom the appeal is made.

The mining fakir is a serious, although a sporadic, source of loss. He hurts the industry directly and indirectly. To his operations, more than to aught else, may be ascribed the prevalent idea that mining is necessarily speculative.

The mining fakir flourishes because of the profound ignorance of the general public as to what mining means. He will disappear only when in the schools of Canada our children are taught something about our second greatest industry.

The other principal cause of waste and loss is well defined by our New York contemporary. The great losses of money in mining, it is pointed out, are due not so much to deliberately fraudulent schemes as to those innumerable "more or less honest, more or less misguided ventures that are not illegitimate but are entered into without competent engineering advice."

Not seldom private mining enterprises are entered into without the advice of an experienced engineer. Costly mistakes are nearly always the result. Either the plant does not meet the requirements of the ore, and this is most frequently the case, or else there is a painful lack of harmony between the integral units of the overground and underground equipment. Special training, long experience and mature judgment are needed in determining just how much equipment a mine will pay for and just what that equipment shall be.

Although it may be out of the question for the small owner to engage the continuous services of a first-class consulting engineer, yet, as is pointed out in the article alluded to, the full benefit of his advice and guidance may be obtained by arranging to have him visit the mine at stated intervals.

It is, of course, in the actual purchase of the mine or property and in the first installation of equipment that the consulting engineer is most needed, for then his counsel will have a vital bearing upon future operations.

THE BRITISH COLUMBIA COAL TAX.

In our last issue we referred to the new British Columbia tax upon coal and coke. The subject is one of large importance alike to the operators of coal mines and to the owners of smelters and metalliferous mines.

It is worthy of remark that the British Columbia Legislature, in dealing with the matter, consulted none of those whose interests are most deeply affected. This is to be regretted.

It remains for the Canadian Mining Institute to discuss the questions involved and then take whatever action is though fit. Meanwhile the Boards of Trade of Fernie and other towns are protesting vigorously.

MINING SOCIETY OF NOVA SCOTIA.

The annual meeting of the Mining Society of Nova Scotia is to be held in Halifax on March 25th and 26th. The annual dinner, always a well-managed and profitable function, is set for the evening of the 25th.

The Council of the Society has issued a circular announcing that the chief topic of the meeting is to be the "Investigation of the Natural Resources of Nova Scotia." Among the guests of honor will be technogolists of international reputation. In every respect, indeed, the meeting will be made the most notable in the history of the Society.

Nova Scotia possesses large and varied stores of mineral wealth. Coal mining is the Province's most important mineral activity. As yet iron mining has met with but slight encouragement. In fact almost all the progress made in this direction is due to the perseverance and courage of the companies organized and controlled by the Messrs. Drummond of Montreal.

The gold mining outlook, although relieved by occasional successes, is not bright. And for this there is no sufficient reason. We believe firmly that many of the abandoned gold mines of Nova Scotia could be made to yield handsome profits if the mining and treatment problems were attacked as systematically and as scientifically as similar problems in South Africa have been.

Other minerals, such as gypsum, marble, barite, stibnite, infusorial earth, etc., etc., occur abundantly. There is also promise of workable tin deposits.

What Nova Scotia needs is just what the Mining Society is attempting to do. The interest and advice of geologists and engineers from the outside world cannot but be immediately helpful.

NOVA SCOTIA STEEL AND COAL COMPANY.

The annual report of the Nova Scotia Steel & Coal Company, noticed fully on another page, has exceeded expectations. Although affected to some extent by the depression of last autumn, the company has succeeded in showing a large profit on its operations for 1907. Undoubtedly both its outputs and its profits would have been larger had it not been for the slackening of all business in the last months of the year. The falling off of 62 per cent. in the earnings of United States Steel for last December gives a fair criterion as to the manner in which Nova Scotia Steel weathered the storm.

A strong and growing concern, built up by men who were at once careful, progressive, and cleanly ambitious; managed by a capable and energetic executive; the Nova Scotia Steel & Coal Company is a Canadian enterprise of which Canadians may well be proud.

Editorial Notes.

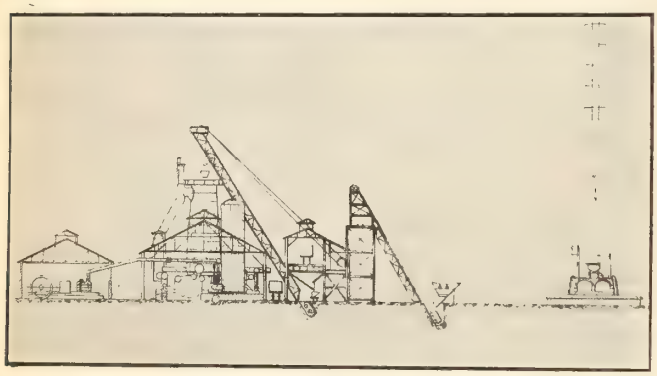
Our Nova Scotia correspondence in the current number should be read by all coal mine operators. Although our news letters from all the mining provinces are valuable and interesting, the questions dealt with by our most easterly correspondent are important in a large and national sense.

The Government of Newfoundland is being criticized for expending thirty thousand dollars on coal boring operations. It is stated that parties are sent out year after year without proper appliances. This criticism seems hardly fair. Even a remote chance of finding coal in Newfoundland should not be neglected.

Estimates of the production of mining camps are very seldom accurate. Even when issued officially they are either incomplete or approximate. The importance of correct returns is indisputable. Investors are influenced largely by a mining district's record. The Canadian Mining Journal receives regularly reports from many mining companies. It would help us greatly if every Canadian mining company sent us monthly returns.

THE ATIKOKEN IRON COMPANY.

L. B. Orchard.



Cuts made from photos loaned by C. N. Ry. Co.

The plant of the Atikoken Iron Company is situated at Port Arthur, on the north shore of Lake Superior. The site selected was one adjacent to the Canadian Northern coal docks.

Dry land was hard to procure, and this was rather a setback to the company in starting operations. The surrounding district is low and swampy, largely muskeg. So the plant was built on a sandbar on the shore line of the lake. In order to procure a good foundation, piles were driven to a depth of about 20 feet to a gravel and clay bottom, and were cut off under water. A concrete filling was then placed over the piles.

The whole plant covers an area of about 2,500 feet by 600 feet, including the dock. It was designed by Mr. Frank C. Roberts, of Philadelphia. The slag from the blast furnace, after having been granulated, was exclusively used for the filling in and the building up of the yards. The main yard and furnace track was built on piles and afterwards filled in in this manner.

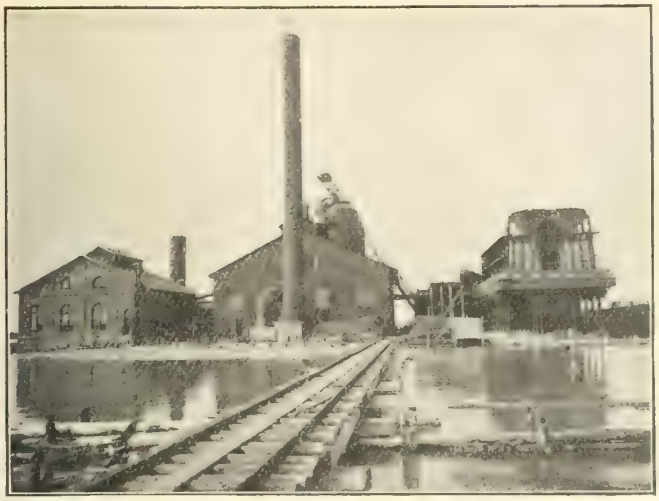
The plant is modern in every respect, and no money has been spared to make the industry the most successful the province has seen.

Section showing Stock-Shed, Furnace, Roaster and Ovens.

Furnace.—This is 75 feet high and has a 14 foot bosh and a hearth 8 1-2 feet in diameter. The capacity of the furnace is 100 tons per 24 hours; but a time last summer, when everything was running smoothly, the output reached 130 tons per day. All parts of the furnace plant, except the boilers and blowing engines, have been designed to accommodate a lining with a 17 foot bosh, which would raise the capacity to 200 tons. Hence with very few alterations the capacity of the furnace could be doubled. The furnace is fitted with two cinder notches at opposite sides, one being used for hot cinders, the other for granulating purposes, for which a special plant has been added. This has also the distinct advantage that should one cinder notch be lost there is the other to fall back upon.

The cast house is 160 feet by 55 feet, and the bed is raised about 10 feet to the level of the furnace; the iron is cast four times in the 24 hours, at 9 and 3 respectively. The bulk of the iron made is No. 1 foundry, with a good open fracture and having an average analysis as follows: Silicon 3.76, sulphur 0.005, phosphorus 0.20, manganese 0.15 per cent. respectively.

Stoves.—The furnace is connected with three Roberts 2-pass hot blast stoves, 18 feet by 75 feet respectively, and are all fitted with valves of the latest design. Each stove has a heating surface of 18,500 square feet, which raises the blast up to a temperature of about 1,250 degrees F. The three stoves are used in rotation, changing every hour, so that when stove No. 1 is on blast, stoves 2 and 3 are on gas, or when 2 is on blast 1 and 3 will be on gas, and so on. Thus each stove has two hours on gas consecutively. Owing to the fact that the furnace is equipped with a Roberts-Whistler dust catcher, the gas conveyed to the stoves is practically free from dust, so saving many unnecessary close downs for cleaning.



The Blowing Engines.—These were built by the Southwark Foundry & Machine Company of Philadelphia. There are two engines, which are horizontal disconnected compound of 600 horse-power each, with steam cylinders 32 by 54 and 48 by 54 inches respectively. These engines are fitted with air tubs 66 inches by 58 inches, and are so arranged that they take their air supply from outside the engine room. This is a great advantage, as it keeps the air free from steam, and also keeps the blowing room heated in winter time. Again, the air outside being colder, necessarily contains less moisture, hence the air blown to the furnace is much drier than would otherwise be the case. The total volume of air blown is nearly 30,000 cubic feet per minute from both engines.

The light and power for the plant is supplied by two 75 kilowatt dynamos connected to two Robb-Armstrong engines. Adjoining the engine room is the pump house, where two 2,500 gallon pumps and a jet condenser are installed, also two boiler feed pumps, all manufactured by the Canada Foundry Company of Toronto. The main blowing engines and large pumps are operated condensing. The dynamos and feed pumps exhaust into heater.

The boiler plant consists of four 225 horse-power Atlas water tube boilers, also built by the Canada Foundry Company. These boilers are specially set to use the water gases from the furnace, thus saving a high consumption of coal. Just sufficient coal is used to keep the gases ignited. For the four boilers only about 20 tons of coal are used per month.

Roaster.—On account of the iron ore used in the furnace containing such a high percentage of sulphur, it has to be roasted before being charged into the furnace. For this purpose a Roberts roaster has been added to the plant. This roaster is charged mechanically from the top and has a capacity of 400 tons per 24 hours; it is divided into sixteen sections of about 25 tons capacity each. Each section has a separate combustion and chimney chamber. The ore passes through the roaster by gravity and is heated to a temperature of about 1,500 degrees F. by a mixture of air and gas from the blast furnace, which is passed through it. The ore remains in the roaster about 24 hours. In its natural state the ore contains anywhere from 2 to 5 per cent. spulphur; but after roasting the sulphur is reduced to about 0.5 to 0.8 per cent. The mechanical draught for the roaster is maintained by two Sturtevant 12 foot exhaust fans.

The arrangements for the handling of the stock are extremely neat and satisfactory, one man being able to handle all that is required for the charging of the furnace. The stock is stored in a series of iron hopper bins, or pockets. These are raised on a steel structure to allow

Power House, Furnace and Roaster

for the loading of the scale car by gravity. A track runs over the top of these lines and the limestone and nace skip, as all the coke for the furnace is charged by measure and not by weight; hence the coke can be dropped straight into the skip. This saves much unnecessary handling. Underneath each bin is is a small trap door to allow the stock to enter an electric scale car or lorry. This scale car runs on a track alongside the head is lowered, the large bell is dumped, precipitating the stock into the furnace. In this way no gas escapes to the atmosphere, and greater uniformity of distribution is effected. The actual charging of the furnace is all operated from a small shed at the bottom of the furnace skipway. Here the tunnel head is revolved by an electric switch and resistance, and the valves are operated for the steam cylinders for lowering the bell. Here also is a mechanical device for testing weights for gauging the height of the stock in the furnace. All these and the electric scale car are operated by one man. Occasionally there is an extra hand for charging coke. The furnace top is visited but once a day for inspection, and any necessary oiling that may be required.

Coke Ovens.—The Atikoken Iron Company make all their own coke and for this purpose a battery of 100 ovens was built, producing about 130 tons per day. On account of the very flat nature of the ground and filling being at a premium the ovens were built on a concrete dock, supported on piles driven into the ground, to bring the ovens to the necessary elevation for loading into the railroad cars. It was at first feared that the ovens being built in this manner, the air would have a considerable cooling effect; but experience has shown that this is not the case, the draught making no appreciable difference.

The ovens were built adjacent to the coal dock of the Canadian Northern Railway Company. The coal is

C.N.R. Coal Docks and C.N.R. Elevator.

coke are unloaded direct from the railroad cars into these pockets. The coke bins are adjacent to the furstock bins, and on it is a tipping buggy which receives the necessary charge of stock, limestone or ore, weighs it and conveys it to the furnace skip, into which it is dumped and then hoisted to the furnace top. The charges of ore from the roaster are received in the same manner as the stock from the other pockets. Under each section of the roaster is a pocket and trap door and the ore is taken in rotation from these pockets—16 in number. It is so arranged that there is always a ready supply of roasted ore. After using ore from pocket No. 1, pocket No. 2 is used, and so on. Thus by the time the round has been made the ore in pocket No. 1 is ready for use. In photograph No. 1 the arrangement of stock bins can be clearly seen at the end of the trestle, and photograph No. 2 shows the separate pockets under the roaster. The stock is raised to the top of the furnace in two skips, operated by a steam hoist. The furnace is fitted with a Roberts revolving top. The charge of stock is dumped into the tunnel head, which is hung on rollers and may be revolved any multiple of a right angle by a small electric motor. After the required revolution has been given the stock, the tunnel head is raised, which allows the stock to fall from the small bell on the large one, the small bell remaining stationary. After the tunnel stored in large bunkers at the dock and transferred to the ovens in a hopper bottom electrical lorry. The Pittsburgh Coal Company supply the coal, which is mined at New River Fields, West Virginia, and is transported to the head of the lake by water.

The coal is of a very good coking quality, an average analysis running as follows:—Volatile matter 22.89, fixed carbon 71.89, ash 5.22, sulphur 0.69 per cent. respectively.

Nothing but 48 hour coke is made. The coke is dark, rather soft. This also shows up well by analysis:—

Section of Plant.

Volatile matter 3.71, fixed carbon 88.60, ash 7.69, sulphur 0.67 per cent. respectively.

The coke is loaded direct into railroad cars and switched to the stock bins at the furnace.

Flux.—For fluxing purposes a limestone from Kelley Island, Ohio, Lake Erie, is used. This is brought up to Port Arthur by water. It is a first-class stone and very clean, as will be seen by the accompanying analysis:—CaO 47.66, MgO 5.1, SiO_2 1.5, Al_2O_3 0.10, Fe_2O_3 0.30. This is an average of several analyses from stock pile.

The chemical laboratory is well equipped with all the necessary and latest apparatus for analytical work required in this industry. Adjoining the laboratory is the crushing room, where all the samples are prepared. It is well supplied with a good mixing table, crushers, bucking boards, also a small hand power drill for drilling the sample pigs. It was pleasing to note that particular attention has been paid to this department, which in many cases is sadly slighted. This department is under the able supervision of Mr. W. Benner. Great credit is due to Mr. Robert Jones, the superintendent, for the efficient manner in which he has superintended the construction of the plant. From the results obtained Mr. Jones has proved himself to be one of the foremost furnace men on the continent. Mr. Jones was previously with the Illinois Steel Company, South Chicago.

Mines.—The iron mines of the Atikoken Iron Company are 130 miles west of Port Arthur, on the Canadian Northern Railway. From the main line a spur runs north for three miles to the mine. The accompanying sketch will help to give some idea of the mine and relative positions of the ore deposits. There are three parallel veins striking east and west. At the bottom of the hill a tunnel 12 feet wide was driven in a northerly direction, and after cutting through 40 feet of rock ore of high grade was struck. This ore was cut through for 40 feet. The tunnel was continued at a width of 6 feet through another 60 feet of rock, when a second vein of ore was struck, but of poorer quality. This second vein proved to be smaller than the previous one, being only 10 feet wide. After another 15 foot rock a third vein was cut of a similar nature to the second, but a little larger, measuring 16 feet. The tunnel was then continued through to the other side of the hill a distance of 100 feet.

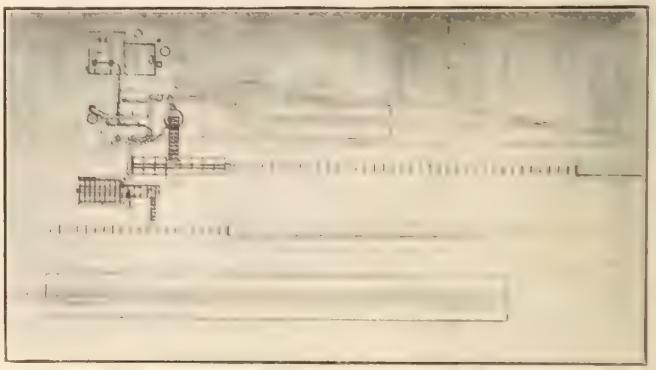
Deposit A is the only one being worked at present. Here ore has been stoped out to a height of 20 feet, and east and west of the main drift for 85 feet. Raises have been started at both ends. That on the west side is up 50 feet. When these two raises are through to the surface, underhand stoping will be tried. Veins B and C are both smaller than A and much broken up, showing more of a schistose structure. They are also lower in sulphur and higher in lime than A.

In physical aspect the ore is a fine grained, close comapct magnetite, showing fine seams and splashes of iron pyrites and pyrrhotite. Traces of calcite may also be noticed here and there in small veinlets. The ore has been traced on the surface for a distance of 4,000 feet and several estimates have been made as to ore in sight ranging up from five million tons. The present mining capacity is 200 tons per ten hour shift. The outfit of air drills consists of four No. 2 and eight No. 43 1-4 "New Giant," all from the Canadian Rand Company. Only the eight large drills have been in operation.

The main tunnel up to the first vein is 12 feet wide and has a double track. This section of the tunnel is the only part of the mine that is timbered. The veins are perfectly perpendicular and so far no other ground has been cut that requires timbering.

On the west side of the tunnel, at vein D, ore was struck, but not in quantity. Two open cuts were worked for a while to try and increase the output, but they have now been abandoned.

The average analysis of the ore shipped to the furnace for the last six months is as follows: Ore before roasting contains anywhere from 2 to 5 per cent. sulphur.



Ore Roasted:—Iron 60.06, silica 9.33, sulphur 0.16, manganese 0.12 per cent. respectively.

The ore is trammed out of the mine in 1 1-2 ton cars direct to a No. 6 Austen cone crusher with a capacity of 50 tons per hour. The crusher feeds direct to a bucket elevator, which raises the ore to a height of 30 feet and delivers it into 50 ton steel ore cars, which are brought up to the switch and then allowed to run by gravity to the elevator.

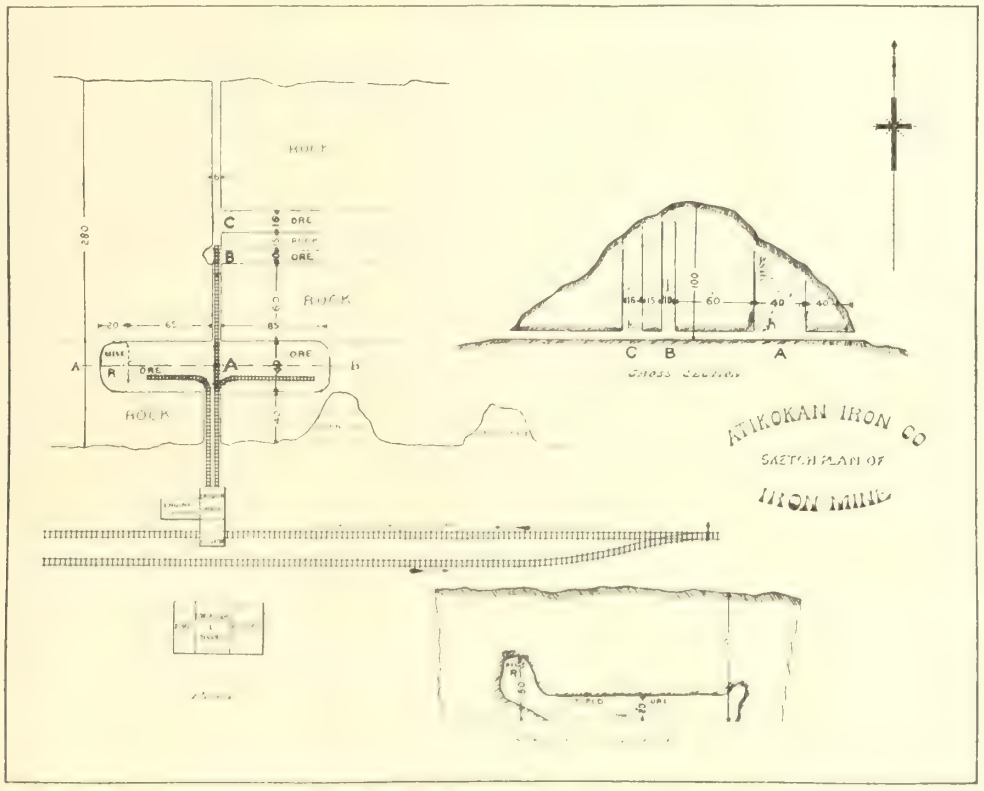
Hard Coal Shed, C.N.R. Coal Docks and Atikoken Iron Works.

In the power house, which is a wooden building 40 feet by 70 feet, and divided into three sections, is one-half of a Canadian Rand compressor, compound condensing class B, one 4 1-2 by 7 by 4 1-3 Fairbanks boiler feed pump, and one 750 horse-power Wainright heater.

General Plan of Works Atikoken Iron Company.

Steam is supplied by three 100 horse-power return tubular boilers, built by the Polson Iron Works, Toronto. The pumps exhaust into the heater, and the suction is direct from the Atikoken river, about 200 feet away.

A 50 horse-power Jenckes single high pressure engine is used for driving the crusher and elevator.



Preparation has been made for the installation of an electric light plant of 150 lamp capacity.

Labor of all kinds has been very scarce, only 65 men being employed at the mines. All the mucking is done by foreigners, chiefly Italians, and many of the machine men are Swedes. All work is done on day pay. The comfort of the men has been well studied. The boarding house is a large two storey wooden building 27 feet by 60 feet with an annex for a dining room. On the upper storey are bedrooms for mine superintendent, foreman, cook, etc., also the mines office. The men's bunk house is splendidly fitted up with iron bedsteads,

CHANGES IN ALASKAN MINING LAWS.

A copy of the new regulations governing filing of affidavits of work on mining claims has been received for publication. The law reads as follows:—

During each year and until after patent has been issued therefore, at least $100 worth of labor shall be performed or improvements made on, or for the benifit or development of, in according with existing law, each mining claim in the district of Alaska heretofore or hereafter located. And the locator or owner of such claim or some person having knowledge of the fact may also make and file with the said recorder of the district in which claims shall be situate an affidavit showing the performance of labor or making of improvements to the amount of $100 as aforesaid, and specifying the character and extent of such work. Such affidavit shall set forth the following:—

Atikokan Iron Mine—Sketch Plan of Iron Mine.

mattresses and blankets to accommodate 100 men. Other buildings at the mine are: dry house, 20 feet by 40 feet, and blacksmith shop 20 feet by 40 feet. The mining department is under the direct supervision of Mr. F. Rodder, M.E.

The mines started operation early in the year, and the furnace was blown in on Wednesday, July 17th, 1907. Everything worked to the entire satisfaction of the management. But for the financial depression that swept the country and the fact that it was so late in the season when the furnace was blown in that the western foundries had placed their orders elsewhere, the plant and mines would be in operation to-day. The furnace was blown out on Friday, December 13th, 1907.

It is expected that with the opening of navigation on the lakes operations will be resumed and continue "in aeternum."

First—The name or the number of the mining claims and where situated.

Second—The number of days' work done and the character and value of the improvements placed thereon.

Third—The date of the performance of such labor and of making improvements.

Fourth—At whose instance the work was done or the improvements made

Fifth—The actual amount paid for work and improvements, and by whom paid when the same was not done by the owner.

Such affidavit shall be prima facie evidence of the performance of such work or making of such improvements, but if such affidavits be not filed within the time fixed by this act the burden of proof shall be upon the

claimant to establish the performance of such annual work and improvements. And upon failure of the locator or owner of any such claim to comply with the provisions of this act, as to performance of work and improvements, such claim shall become forfeited and open to location by others as if no location of the same had ever been made.

The affidavits required hereby may be made before any officer authorized to administer oaths, and the provisions of sections 5392 and 5393 of the Revised Statutes are hereby extended to such affidavits.

Said affidavits shall be filed not later than ninety days after the close of the year in which work is performed.

Section 2. That the resources of the several divisions or districts of Alaska shall collect the sum of $1.50 as a fee for the filing, recording and indexing said annual proofs of work and improvements for each claim so recorded.

Approved March 2, 1907.

FUNCTIONS OF THE CONSULTING MINING ENGINEER.

By Allen Hastings Rogers.*

(Reprinted from the "Engineering and Mining Journal" of New York.)

There are many engineers in this country who call themselves consulting engineers, and as such they are prepared, as their title implies, to be consulted on engineering questions. Referring more particularly to the consulting mining engineer, his functions do not seem to be understood in their entirety in this country, and it does not appear improper to venture a short description of the service which he offers.

It is rarely that the consulting mining engineer is called on for any service other than the examination and valuation of mining property for prospective purchasers, but this, while one of his most important, is far from being his only field of work.

The examination and valuation of mining property for purchase is, of course, a very important work, and, since large amounts of money are usually involved, the engineer's position, as the representative of the purchaser, is one of great trust. But it is almost invariably for the purchaser that the engineer acts. Vendors of mines do not, as a rule, call upon the consulting engineer for a report on the basis of which to present their property. This, in my opinion, is a great mistake on the part of the vendor. For there is nothing that can awaken interest in an enterprise as much as a proper report on the property. Those commonly presented are worthless in that they fail to give much important information, and what is given is usually in such general form as to awaken suspicion as to its accuracy; in fact these statements often prove on analysis to be inconsistent and sometimes even contradictory. The width and assay value of the ore and the tonnage developed may be stated, but if, by chance, any detailed figures are given, they will generally be found to fail entirely to support the general statements.

Preparation of a Property for Sale.

No one is likely to spend several thousand dollars in the examination of a property, the description of which, on reading, leaves a feeling of distrust. Owners would further their own ends if, on offering their property for sale, they first invested a little money in a good report, accompanied by assay and other maps, thus showing that the property is worth the price asked. Besides, a great many owners have not the faintest idea how to value their mines and, for fear of selling too cheaply, put a price on them which is prohibitive, and thus spoil the chance of a sale. The consulting engineer, representing the vendor, is just as capable of fixing a fair price for sale, as when he represents the purchaser.

While the fixing of the proper price, at which the purchase of a mine is made, is of paramount importance to the ultimate success of the undertaking, nevertheless, as soon as the property has been purchased, its economical operation becomes of as great importance. The valuation at the time of purchase is made on the basis of certain operating costs. If these costs are exceeded through inexperienced or inefficient management, the enterprise has as poor a chance of success as if it had been purchased at an excessive valuation. In England it is thought to be fully as important to obtain the best advice concerning the operation of a mine (and, concurrently, of information as to ore reserves, condition, etc.) as regarding its valuation for purchase, and it is commonly the custom to retain, for advice as to operation, the engineer on whose recommendation the property has been purchased.

In this country such is not commonly the case. Even the big exploration companies maintain an examining staff separate from their operating staff, and it often happens that, after the mine is purchased, the costs estimated by the examining engineer are not realized when the operating staff takes hold, either because the figurs are impossible of realization, or because of incompetence on the part of the operating department. In the case of the independent companies, when the property has been acquired on recommendation of a properly constructed report by a competent engineer, the operation of the mine is often intrusted to an incompetent man and the examining engineer's recommendations are disregarded so that failure results, with, in many cases, unjust discredit to his judgment. This is mainly due to the desire of the directors to economize as much as possible, but also in some degree it is due to too much confidence placed in the so-called "practical miner." The desire for economy is laudable, but, when practiced at the expense of results, becomes folly, or worse.

Mistakes of Small Mining Companies.

Nowadays it comes pretty near being true in almost every line of work that a man's ability is measured by the salary that he earns, and, while no doubt appreciating this, the directors, of what we may call the amateur mining company, argue that, as their operation is small, they cannot afford to pay a high salary for the management of a property employing, perhaps, 25 men. So they place their property in charge of a low-salaried

*Mining Engineer, 82 Beaver street, New York.

man, who, perhaps, under competent direction may be well qualified to look after the details of the work, but who, without such direction, spends the company's money on such errors as driving long crosscut adits to gain hundreds of feet of depth on the strength of a surface showing, but little, if at all, explored; who sinks shafts 200 or 300 feet apart; who drives levels at 40 or 50 foot intervals or buys tramways, mills or smelters entirely unsuited to the ore or of a capacity entirely disproportional to the capabilities of the mine.

But the consulting engineer, by making two or three visits a year to such a property can direct, in a general way, the development and save the owners from such expensive errors. His charges for such service would be relatively small, as it would consume comparatively little of his time. The large companies, each operating a number of mines, place in charge of all their operations a high salaried man, who, by periodical visits and by correspondence during the interim, directs operations so that a much lower salaried man may be employed for resident superintendent. One of the advantages gained by consolidation in any branch of industry is that small constituent properties get the benefit of superior ability at small cost. But the small independent mining company can put itself in a position analogous to that of one of the mines of the big consolidation by retaining a consulting engineer.

Let us see what the consulting engineer would do under such circumstances. His work would be, according to the terms of his engagement, to act either as advisor to the board of directors or as non-resident manager. In the first case he gives advice, but only when called upon to do so, regarding any point which may be brought up. Such advice includes the decision as to the purchase of certain machinery or other equipment, the examination and criticism of an ore-selling contract, etc. Such service is rendered for a small retaining fee under much the same arrangement as lawyers are retained. In addition, it is frequently stipulated in such arrangements that the engineer may be called upon to visit the mine, if necessary to settle some question which may have arisen; in such a case a stated per diem rate, in addition to his regular retainer, is paid him.

Duties of a Non-resident Manager.

At the other extreme is the full management of the property with full responsibility to the directors. The engineer's duties under such an arrangement are the same as those of a resident manager except that the carrying out of the details of the work, which he plans, are left to a superintendent on the ground, who may thus be a low salaried man. He visits the property as often as the magnitude of operations and the speed with which the work advances require; he engages a man having his confidence as resident superintendent, who reports to him; he receives at frequent intervals reports and maps covering the progress of operations and so is enabled to issue instructions supplementing those given at his visits; he approves all important requisitions for supplies and equipment; he draws specifications for obtaining bids where necessary and, in fact, oversees in every way the operation of the property. He renders to the directors all information regarding the progress of operations and draws up for the annual meeting a report describing the work done during the year, the condition of the mine, the extent of the ore reserves and the outlook for the coming year.

The foregoing paragraph describes briefly the work of a number of consulting mining engineers in England but, except for the large companies, which take all the time of their general manager, I believe there are few such instances in this country. The number could be increased with profit to the mine owner. But the consulting engineer can be employed to cover any range of authority between none, as when he acts in purely an advisory capacity as described in the first case, and full authority as described in the last. I believe many people are ignorant that such arrangements can be made at reasonable terms, or if informed at all, they think it necessary to pay the enormous salaries we see occasionaly reported in the daily press.

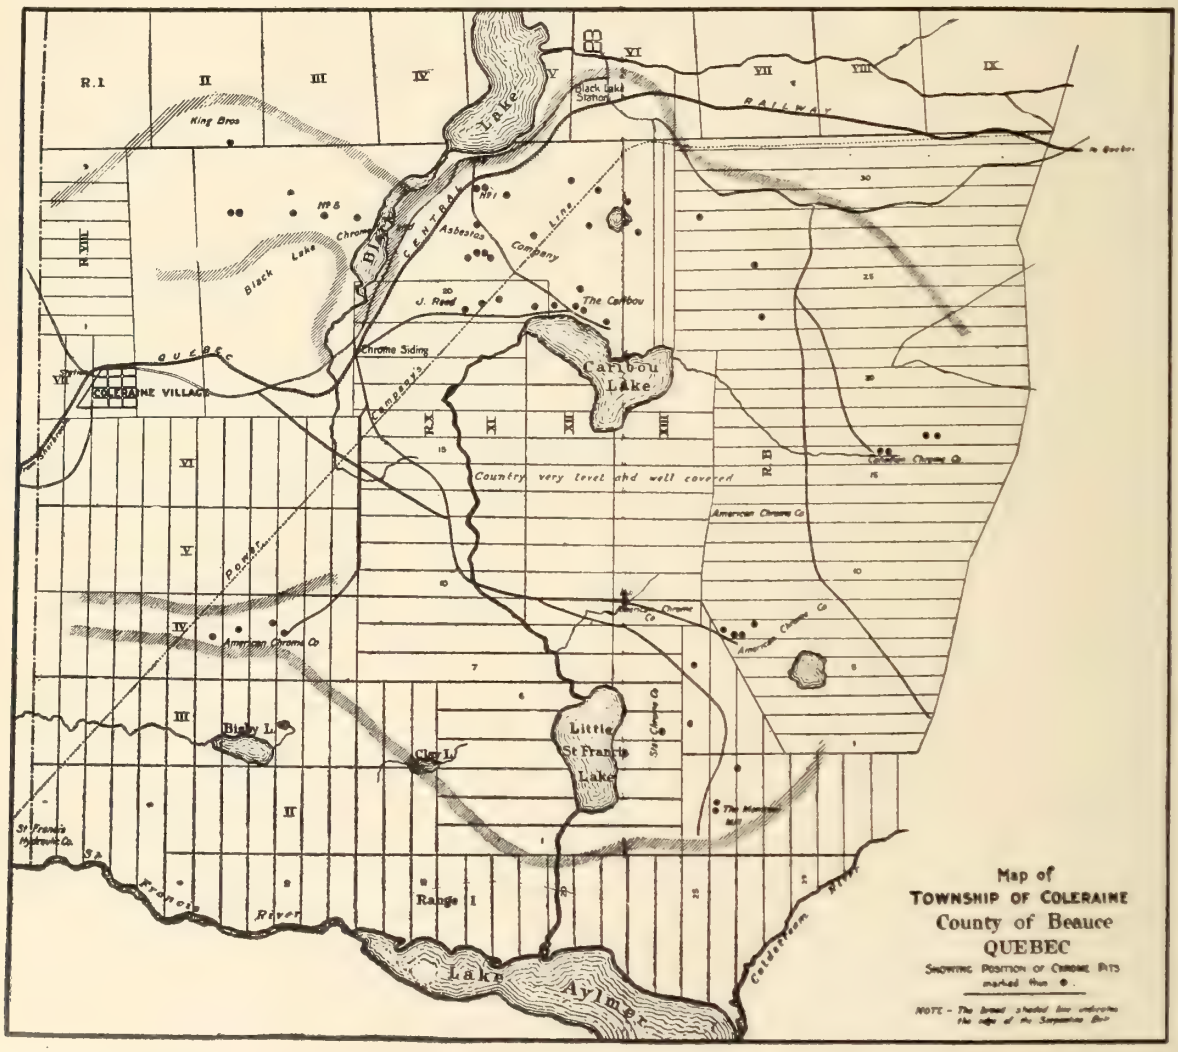
Errors Avoided by Employing Non-resident Managers.

Although cited as one of the greatest errors which can be made in the development of a mine, one frequently hears of the erection of a mill or smelting plant before sufficient ore has been developed to warrant it. In a great many cases, even when the erection of a reduction works is warranted, the process or apparatus is entirely unsuited to the character of the ore, or the capacity is too large for the mine. There are two principal causes which tend to hasten the erection of a reduction plant—the desire of the owners to make the property pay and the desire of the machinery manufacturers to sell their goods. Both of these tendencies are perfectly natural. We cannot blame the owner for wanting to limit his investment to the smallest possible figure, nor for his desire to obtain dividends. He is perfectly right from his standpoint; the only error which he makes is that he decides to erect the mill on incompetent advice. Having decided to erect the plant, the catalogues of machinery companies furnish a variety of plans from which to choose and the machinery manufacturer does not inquire whether the plant which is ordered is properly adapted for treating the ore, nor whether there is sufficient ore to warrant its purchase and erection.

To avoid such errors, a mining engineer should be consulted. In the first place, he will tell the owner whether the condition of the mine warrants the erection of the reduction plant; whether the ore as then shown is likely to change its character with depth, and so render the mill erected for treating it valueless later; what process should be adopted for treating the ore, what capacity the plant should have, and furnish plans for the plant. If there is not ore enough developed to pay for the plant, it is folly to erect it, for the ore may give out. If the character of the ore is likely to change it would be foolish to build a plant until its permanent character is determined. The cost of this service is not excessively high and the insurance of success which it gives to the owner, instead of leaving the question to be decided by chance, is worth many times the cost.

In conclusion, then, it should be impressed on mine owners, directors and shareholders in mining companies that success is not largely a matter of chance, but that the surest road to success is to entrust the operation of the property to a man thoroughly qualified by technical knowledge, which has also been supplemented by a long experience. If they will employ such a man as resident manager, they are giving their property the best possible chance of a profitable outcome. But, if the operation is small, let them turn the technical management over to some well qualified consulting mining engineer as the next best course. Just as they would not turn the trusteeship of an estate over to a stockbroker's clerk, so they should not take the advice of the mine foreman when they invest large sums in adits, shafts or mills.

CHROME IRON MINING IN CANADA.



(A paper read before the Mining Section of the Canadian Society of Civil Engineers.)

BY H. F. STRANGWAYS.

Within the last few years there has been a large increase in the consumption of chromium in the Arts. This increase has been chiefly caused by the large demand for chromium salts in the tanning industry, to furnish a substitute for the acid in the tan bark, the increasing use of chrome brick for refactory purposes, and of ferro-chrome alloys for special steels. Chrome, however, is used, and is likely to be used in the future, to a much greater extent in the manufacture of chromium salts than for any other purpose.

Thetford, the distance from Montreal to Black Lake being 60 miles,

Chrome iron mining was begun in this region in 1894, and up to comparatively recent date, was carried on in a very spasmodic manner. The production up to 1898 amounted to a total of only 10,000 tons, while in 1905 alone it amounted to 7,600 tons, and in 1906 it had increased to nearly 9,000 tons. The greater portion of the ore shipped to the United States. Ore which is sufficiently rich to be shipped without concentration is termed

The Eastern Townships' deposits all lie in the region known as the "serpentine belt." The centre of the deposits is situated approximately at the little village of Black Lake, in the Township of Coleraine, but the productive region may be said to extend for a radius of about five miles from this village. All the districts from which chrome is now shipped, lie within ten miles of Black Lake. The Quebec Central Railway passes through this region, and none of the chrome pits are more than seven miles from the track. The journey from Montreal is made either by the Canadian Pacific Railway or Grand Trunk Railway, as far as Sherbrooke, and thence by the Quebec Central Railway to Black Lake, or

"Crude," and grades from 45 per cent. and upwards of chromic acid or sesquioxide. Concentrates also are shipped and paid for according to grade. The prices paid for both "crude" and concentrates vary between $9.00 and $12.50, the price depending on the grade or percentage of Cr_2O_3 contained.

In the earlier years of this industry in Quebec, there were large numbers of small producers, whose inability to keep their contracts, forced buyers to make their purchases elsewhere. The competition of the European and the New Caledonia ores, together with the irregular and pockety nature of the Quebec ore bodies, then being worked, was answerable for this state of affairs. Mining

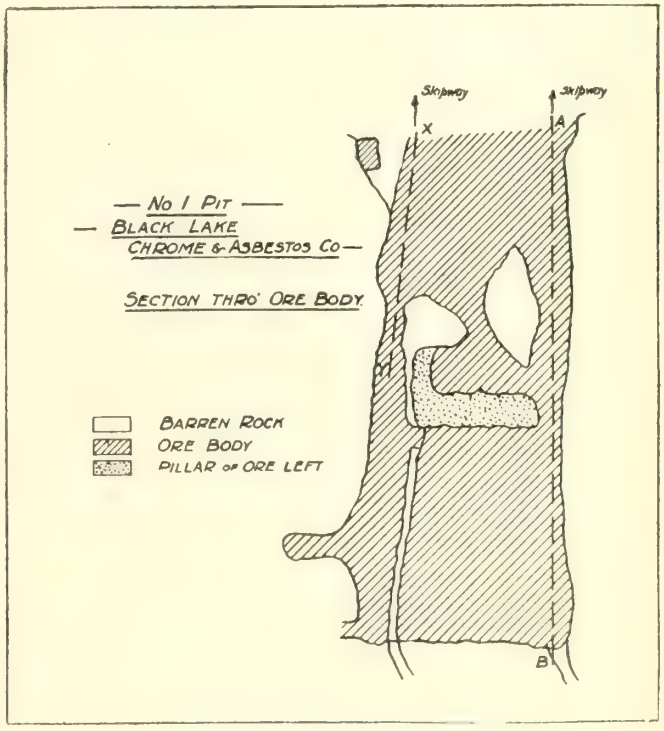
was carried on by means of open pits, and all the ore was taken out as soon as it appeared. When the ore body punched out, as happened in most cases, there was no chrome ore forthcoming to enable the mine owners to keep their contracts; hence purchasers in the United States became disinclined to contract for Quebec ore, and in consequence the pits closed down, as either the uncertainty of finding more ore, or the dead work necessary to extract it when found, proved too great a handicap to the small producer.

The consequence is that at the present day there are, scattered all over this region, numbers of small pits from which crude ore has been taken and shipped, the pits themselves having been eventually abandoned. The success of chrome mining is due, not to mining men, but to those not immediately connected with the industry, and the credit for putting the industry upon a solid basis and establishing a reputation for the Quebec product should be given to Mr. J. N. Greenshields, of Montreal, who is the principal shareholder in the Black Lake Chrome-Asbestos Company.

GEOLOGY.

The geology of this region is rather complex, and it is only necessary to state that the chrome deposits all lie in what is known as the "serpentine belt." This serpentine represents the alteration of a peridotite, which was intruded through sedimentary rocks, probably of Cambrian age.

Chromite has been found only in peridotites and allied magnesium rocks, or in serpentine, which has resulted from the alteration of these rocks. It is true that there are alluvial deposits of chrome, but these can be traced back to the original peridotite rocks. The New Caledonia deposits are of this type.



Up to the present time comparatively little investigation has been made into the origin of chromite deposits. The theory set forward by Pratt, Vogt, Adams, and others is, that deposits of chrome ore, wherever found, are segregations which have crystallized out from igneous magmas on cooling. Pratt, in 1899, in speaking of the North Carolina deposits, says: "My observations have shown that large deposits of chromite occur in the peridotite rocks, near the contact of these rocks with the enclosing gneiss. Also, that where there is but a small amount of chromite, either in pockets or crystals, these are more abundant near the contact and diminish in number towards the centre of the mass.

"The constant occurrence of the chromite in rounded masses of varying size near the contact of the peridotite with the gneiss, and its occurrence in the fresh, as well as in the altered peridotite, would indicate that the chromite was held in solution in the molten mass of the peridotite when it was intruded into the country rock, and that it separated out among the first minerals as this mass began to cool."

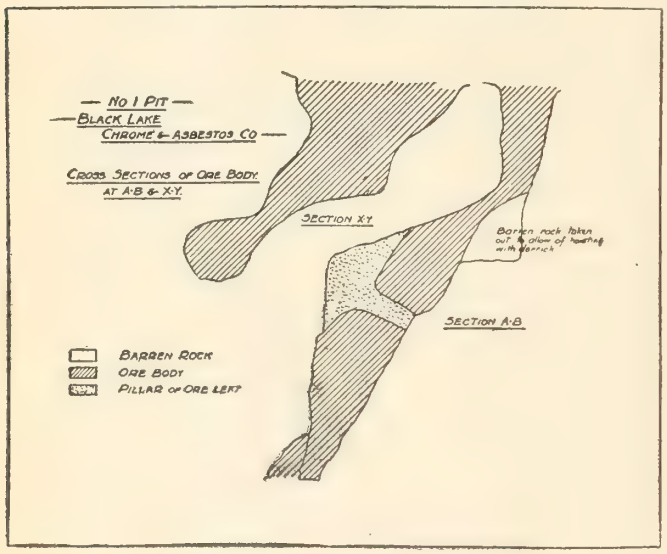
This theory of segregation can very well be applied to the Eastern Townships' deposits, as regards the proximity of the ore bodies to the contact.

Nearly all the pits which have been worked lie close to the contact between the serpentine and the country rock, which here is probably Cambrian. At No. 1 pit of the Black Lake Chrome Asbestos Company the actual contact, although covered, is not very far from the ore body; the contact in this case is betweeen serpentine and a chloritic schist. At the Caribou pit the geological relations cannot be obtained on account of the heavy covering of drift. At No. 5 pit the contact is close to the pit, being the same as that at No. 1. At the Montreal pit the contact is within 50 yards of the ore body; in this case it is between the serpentine and a later diabase which evidently was intruded at the point of original contact between the serpentine and the earlier sediments.

Even if the ore bodies were not near the contact the irregular and pockety nature of these deposits would lead one to accept this theory of segregation. The irregularity is further accentuated by an extensive fracturing and faulting which has taken place. The ore sometimes occurs as large masses of "crude," which gradually die away or disseminate into concentrating ore, and then passes to the barren rock. Sometimes, however, the "crude" will separate cleanly from the barren rock without any gradual transition, suggesting a possible re-arrangement by underground waters, although in most cases in which this happens the rock face will be found to be slickened so that this clean separation may more probably be due to the extensive fracturing and movement which has taken place, especially as

No. 1 Pit, Black Lake Chrome & Asbestos Co. Vertical Section.

such ore bodies represent a line of weakness along which movement would occur.



Slickensides are numerous in the serpentine, and the greasy, slippery rock face, which results renders mining operations dangerous.

The Canadian ore is produced principally by three companies Black Lake Chrome Asbestos Company, the Canadian Chrome Company, and the American Chrome Company. Of these the B. L. C. A. Company is by far the largest. In its extensive holdings the company has several chrome pits, only four of which have been worked to any great extent. These are No. 1, the Caribou, No. 5, and the Montreal. The company employs between fifty and seventy-five men when four pits are all in full working order.

No. 1 pit is the largest single chrome pit in Canada. It is admirably situated as regards transportation, power, and water facilities. The pit itself is about 1,200 feet to the south of the Quebec Central tracks; the siding put in to serve the pit leaves the main track about

one mile from Black Lake station. Power is furnished by the St. Francis Power Company, at reasonable rates. The water for the mill is obtained from Black Lake, which is distant some 400 yards.

The two sectional drawings which accompany this paper will serve to give some idea of the shape and size of the ore body at this pit. Originally there were three distinct ore bodies at the surface; one of these, shown to the extreme right of the section, was very small and soon pinched out; the other two were worked by an open cut to a depth of 70 feet. At this point both bodies showed signs of pinching out and the company expected to lose them altogether. The pit at the surface measures, roughly, 100 feet by fifty feet, which can be taken as the dimensions of the ore body at this point; at the 70-foot level, the width of the ore body is only 5 feet. However, on following this narrow strip of ore, it was found that both bodies took a sudden pitch as shown in the section, and then widened out considerably, the distance between the hanging and foot wall being as much as forty feet in some places. A single derrick served originally to hoist the ore from the pit, but on account of the pitch this method was abandoned. Before its aban-

No. 1 Pit, Black Lake Chrome & Asbestos Co. Vertical Section.

donment a considerable amount of barren rock was removed to permit hoisting with the derrick. A narrow band of barren rock separated both bodies from the surface down, and on account of the great width of the bodies beyond the point where the dip changed, it was deemed expedient to work each separately, leaving the barren rock as a pillar to support the roof. Two skip ways were put in and the ore hoisted in small self-dumping skips. The method used to extract the ore beyond the pitch was the same as in the open cut system. All the ore was taken out as it was found.

It was evident, however, as the pit increased in depth that measures must be taken to support the roof on account of the great distance between the hanging and foot wall. Accordingly on the 250-foot level, a large pillar of ore, some 16 feet in thickness, was left in, extending across the pit. The bodies were worked below this to the 340-foot level. In the meantime the company had bought a diamond drill and had begun exploration work in the bottom and sides of the pit. Finally the pit was considered too dangerous to be worked on account of several minor accidents which had occurred, and the company decided to close it down. This took place a year ago, and since then an incline shaft has been sunk starting about 40 feet to the left of the present pit. The shaft is a two compartment, one measuring 6 feet by 10 feet, inside the timbers, the inclination being 60 degrees easterly, which is the approximate dip of the pit. At present the shaft is 270 feet deep, and sinking is being extended. A considerable quantity of ore has been left in, at the pillar already mentioned, and a cross cut is being driven at the 250-foot level to extract this ore. Another cross cut will be put in at the 340-foot level, as there is a large quantity of ore in the lower part of the pit.

Diamond drill borings have proved the continuance of the ore below this level, and also indicate that the ore bodies have taken a pitch to the left or north and east. This is indicated in the section. As to the manner in which the ore which is left in the pit, and also that below the present level, will be extracted, the writer is unable to say. The equipment of the pit is not very extensive, consisting, as it does, of a five-drill Rand Air Compressor, driven by an induction motor, furnishing air for pumping, hoisting, haulage, and drilling. A new hoist, capable of handling 150 tons a day, is to be installed when the shaft is finished, and a large bin, discharging to a sorting floor under cover, has already been erected at the pit head.

SORTING.

A certain portion of the ore as it is mined is sufficiently rich to be shipped; this ore grades 43 per cent. (and upwards) chromic oxide, and is known as "crude." This proportion varies, but the average for this pit is about 15 per cent. of the total rock hoisted. The mill waste, or concentrating ore, varies in contents of chromic oxide from 7 per cent. to 40 per cent., and amounts to about 45 per cent. of the toal rock hoisted, and the rest, amounting to some 40 per cent., is dump material. Nothing, roughly speaking, under 7 per cent. is put through the mill. This necessitates a certain amount of sorting. Formerly each of the two skips dumped into a bin and the ore fell from the bin on to a platform on which it was sorted. The "crude" was still further cobbed at the siding. A great deal of trouble used to be caused on account of the freezing up of the ore in the bins in winter time, and on account of the difficulty of getting good men who would do good sorting, when exposed to the cold. When active operations are resumed all the ore will be hoisted from the shaft and dumped into one large bin, falling thence to a sorting floor. The material will be shovelled trough holes in the floor into the tramway cars.

THE MILL.

The mill is situated at the siding some 1,200 feet from the pit, and a tramway connects the two. The tramway is carried on a trestle throughout its entire length, thus in winter any trouble from snow is avoided. A small double cylinder hauling engine, with cars operated on a tail rope system, serves to deliver the mill ore to bins in the mill, which is 85 feet below the pit head.

The mill scheme is a simple one, being as follows:—

From the cars the ore is dumped into a 100-ton bin, falling thence to a 12 inch by 15 inch Blake crusher. From the crusher it is elevated to a shaking trough, which distributes the ore to the battery or feed bins. From the bins the ore is fed by Challenge feeders to the stamps, which, in this mill, number 30. The duty of the

stamps is in the neighborhood of 2 1-2 tons per day, their weight is 1,100 pounds, and the drop 8 inches, which, as the dies wear, increases to as much as 15 inches. The mortar has a double discharge, both back and front, and the screens are twenty mesh. Each battery of five stamps discharges its pulp directly through a pipe to a single Wilfley table, and each table makes three products—heads, middles, and tails. The heads are shovelled from receiving boxes into barrels and wheeled to the concentrate shed, and dumped there to drain. The bulk of these concentrates is large, amounting to as much as 15 tons a day, and two men are kept fully occupied in handling them. A drag conveyor was once installed for this purpose, but the wear and tear due to the hardness of the ore was so great that this method was abandoned.

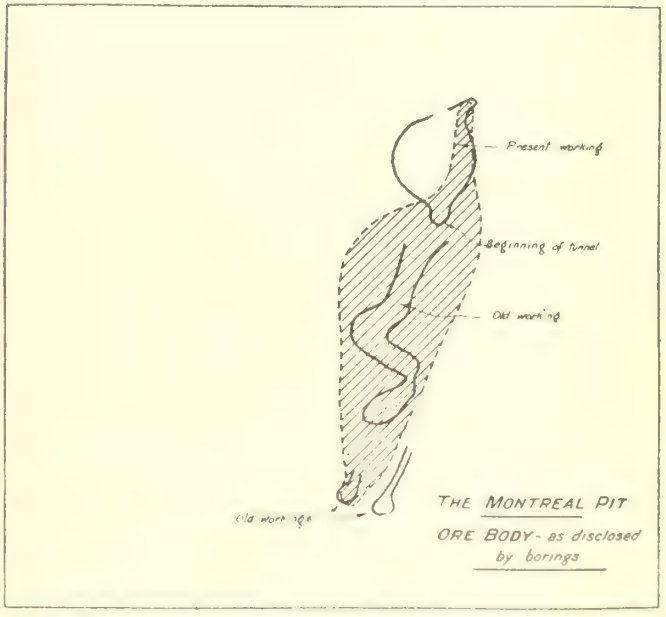
The middles from all six tables fall into a launder, and are passed thence to a separate Wilfley table, which makes two products, heads and tails. These heads are of lower grade than the heads from the first six tables, and are put through the mill again. All the tailings flow from the mill to the lake. There is a difference in level of some 250 feet between the mill and the lake, and an electrically-driven pump supplies water to the mill. The power required for the mill and the machine shop is supplied by a 100 H. P. three-phase induction motor. The machine and blacksmith's shop are situated at the back of the mill.

The Caribou Pit.

This pit lies some two and a half miles to the south of No. 1, and a wagon road connects the two. A large quantity of "crude," of good grade, has been taken from this pit, but at the present time no work is being done in it.

No. 5 Pit.

This pit is situated on the west side of Black Lake, and is not being worked at the present time, although a considerable quantity of ore has been extracted from it in the past. The "crude" from this pit is of the highest grade of any found in the district, running as high as 56 per cent. chromic oxide.



The Montreal Pit.

This pit was originally owned and worked by the "Eastern Townships Chrome Iron & Milling Company." It lies about seven and a half miles to the east of the railway, and a waggon road connects it with Chromem Siding, from whence all its ore is shipped. Chrome Siding is about one and a half miles to the south of No. 1 pit. At the present this Montreal pit, together with No. 1, are the only two out of the four which are being worked. This pit has its own mill.

Up to 1898 3,000 tons were taken from this property, and there was every indication of its being able to furnish many times that amount. Numerous outcrops of ore, from 12 to 15 feet in thickness, occurred along a length of some three hundred feet, but when worked were found to pinch out. Their position is indicated on the map by the outline of the old workings.

The present company took the property over two years ago, and since that time a considerable quantity of ore has been taken out. The company has also done some diamond drill exploration work, which has proved very satisfactory. The borings indicate the existence of a large body of chrome ore of the shape shown on the map. The size of the body as at present developed by the borings is 400 feet in length; with an average of 50 feet, while the thickness varies from 16 to 50 feet. There is a covering of barren rock some 50 feet in thickness over this body. The present output is maintained from the pit shown at the extreme left of the diagram. This pit, at the surface, measures, roughly, 80 feet by 50 feet; a depth of 50 feet has been attained, and a body of good ore is showing on the bottom and east sides of the pit. The ore disclosed by the drill holes is being taken out by a drift, which, at present, has reached some 50 feet, being in ore all the way. One of the drill holes has been pased, and the results given by the drill compare very well with the ore actually found.

The deposit will be mined probably by a room and pillar system, although no very regular system can be employed on account of the variation in the thickness. At present two boom derricks serve to hoist the ore from the pit. The ore is roughly sorted in the pit, and the large pieces of "crude" are hoisted separately and dumped at the surface in heaps, to be cobbed. The boxes in which the mill waste is hoisted are lowered on small trucks and conveyed by the tramway to the mill. The barren rock is hoisted separately and dispatched to the dump. The drills, hoists, and pump are steam driven, the boiler of the mill supplying the steam.

Sketch Plan.

The Mill.

The location of the mill is an admirable one, situated, as it is, on the hillside about 400 feet from the pit, and about the same distance from the lake. The mill scheme is the same as that at No. 1 mill. The ore is fed to a Blake crusher, falling thence to the battery bins. Fifteen stamps, in batteries of five, discharge the pulp through twenty mesh screens to three Wilfley tables. The middlings from these tables all go to a fourth, which makes lower grade heads and tails. These heads are re-fed to the crusher, and again passed through the mill. The tailings from all the tables flow to the lake. Two 45 H. P. flue boilers supply steam for both pit and mill, the fuel being cordwood. A single cylinder Corliss engine drives the mill and crusher.

A great deal of difficulty is being experienced in the transportation of the ore to the railway. Teams are employed for this purpose at present, but the method is costly and inadequate for the present output. The load is favored by the grade of the road, an advantage, however, which is off-set in wet weather on account of

the very bad state of the road, notwithstanding the fact that the road is constantly being improved by the company. An aerial tramway or narrow guage road for this distance of seven and a half miles would be impracticable on account of the first cost: probably the best means of transportation which could be employed would be either a traction engine or a motor lorry.

The Canadian Chrome Company.

This property is situated about four miles from Thetford, from which point all its ore is shipped. The company has opened up four small pits, all within a distance of 400 feet; only one of these pits is being worked at present, but it is by far the largest of the four, being some 100 feet to 125 feet at the surface, and 60 feet in depth. There is a small amount of "crude," and a considerable quantity of concentrating ore showing in the present workings. A single cable hoist, similar to those used in the asbestos pits, elevates the ore to a tramway, carried on a high tretle, and thence to the mill. One small vertical boiler supplies the steam for hoisting, pumping and drilling. All the hoisting arrangements will probably soon be changed, as the cable hoist at present used, commands only a part of the pit, and the steam supply is inadequate for the demands made upon it. The ore is conveyed on the tramway to the mill, dumped into a chute which feeds into a large Blake crusher, and is elevated from the crusher to the battery bins. The mill consists of twenty stamps, delivering pulp to four Wilfleys; the middles all go to a fifth Wilfley. The mill scheme is similar to that of all other mills in the district. Current is taken from the St. Francis Power Company's line to a 100 H. P. three-phase induction motor, which operates both the crusher and the mill.

The water supply for the mill is taken from a small stream about a quarter of a mile distant from the mill, an underground wooden pipe connecting the two. Two small dams at present serve to store a supply of water for the dry months; the lower of these two dams is to be raised six feet, as the reserve is insufficient. The transportation of the ore to the railway presents much the same difficulty as at the Montreal pit, although the distance is less, being but 4 miles to Thetford. A traction or motor lorry would probably afford a solution of this difficulty.

In conclusion, a few words on the concentration of these ores may be of interest. The present system of concentration has been in use practically since the beginning of the industry. Since the time when it was first used there have never been any radical changes, and it must be remembered that although the system is admittedly wasteful, it nevertheless possesses many advantages, chief among which are low first cost, and the simplicity of operation. The later advantage bore greater weight at the start than it would perhaps bear at the present day, as the labor had to be recruited from the vicinity, and experienced mill men would have been hard to find. Then, again, the uncertainty of the industry, both as regards the ore itself and also the market, told against any changes. The use of the Diamond Drill will undoubtedly greatly remove the difficulty of supply, as it will certainly help in development work. Once the question of supply is settled, definite contracts can be more easily made and kept, thus disposing of the market difficulty.

As regards crushing, in connection with this system, it is necessary, in order to produce a concentrate of high enough grade to ship, to reduce the ore to a size of about 20 measures to the inch. Certain experiments, performed by Mr. Patterson, under the supervision of Dr. Porter, M. Can. Soc. C.E., in the laboratory of McGill University, indicated that, with a 15-mesh screen, a larger total extraction could be made, although the grade of the concentrate was not improved. The practice at the mills, however, is to reduce all ore to 20-mesh.

One of the first mills in the district, installed at No. 1 pit, used graded crushing with jaw crusher rolls, and the writer believes, jigs, but these were replaced eventually by stamps and tables. It is very difficult to get information regarding this mill, on account of the time which has lapsed, but the scheme proved unsatisfactory, either on account of losses or else on account of the inability to produce high grade concentrates. Probably, as regards losses, the amount of fines made when rolls and crushers are used would be less than when stamps are used, especially as chromite is very brittle, and shows a great tendency to slime. However, in the experiments already referred to, it was found that the amount of slimes made when using a Huntingdon mill were more than those made by the stamps, using the same sized screens in both cases; and possibly the same may be found to be the case in a system using rolls. It is more probable that the simplicity of operation in the case of stamps, together with their small maintenance cost, as compared with the complications of a method using graded crushings, and as compared with the high cost of up-keep of such a system for screens, etc., were the deciding factors in the crushing arrangements of these mills. The mineral shows a great tendency to slime, so that if stamps are used the pulp should be driven out of the mortar as soon as possible; for this purpose heavy stamps, with a quick, small drop, a mortar with a low, double discharge both back and front, and plenty of water, are necessary. The present stamps possess these requirements, except perhaps as regards the water. From the stamps the ore passes without sizing to the Wilfley tables. Before dealing with the question of sizing one peculiarity in attempting the concentration of this ore, as compared with ordinary concentation practice, will be pointed out.

In most cases in which concentration is necessary to obtain a product of high enough grade either to smelt or ship, the mineral content is rarely over 5 per cent., and the variation in this content, although it may be as much as 50 per cent. of the original amount above or below the average value, does not affect to any great extent the ratio of the gangue to the mineral, as the gangue is so greatly in excess. In the case of chromite the percentage of mineral in the ore is large, and the variation in grade is excessive, the range being, roughly, between 7 per cent. and 40 per cent. chromic oxide.

Classifiers were used at the Montreal and No. 1 pits in previous years, but they have since been removed, as it was found difficult to keep them in adjustment. The reason for this was probably the irregularity of the feed, but there is no doubt that, given a good, steady head of water, and some good type of classifier, satisfactory results could be obtained in classifying the pulp before sending it to the tables.

The other alternative for sizing is the screen. Since the introduction of the Callow screen, many of the difficulties of screening fine material have been removed. The writer has never seen a Callow screen in operation, but understands that there is no doubt as to the possibility of its being satisfactorily used on fine material.

The irregularity of the feed would not altogether be removed, if either screens or classifiers were used, but

the tables could be more easily adjusted to take a particular size, whereas at present, with the irregularity of both grade and size on the tables, the smaller particles of chromite stand but little chance of being saved.

Sizing might, or might not, improve the grade of the concentrate, probably it would do so, and, at any rate, the extraction could be made greater.

The next difficulty in these mills is the re-treatment of the middles. All middles at present are sent to an extra table and two products are made, heads and tails. The tails from this table run exceedingly high, grading as much as 18 per cent. chromic oxide. The heads made are not of a sufficiently high grade to be shipped, and are put through the mill again. The object of re-constructing the middles and putting the resulting heads through the mill again is not apparent. A much better course would be to put either all the middles through the battery bins again, or to dump them separately and keep them for future re-treatment. They could be either crushed by stamps, using a finer screen, or reduced by means of some type of grinder.

The limit of values of losses in tailings may be put as between 3 per cent. and 7 per cent. A loss of 7 per cent. on a 40 per cent. ore would represent good work, giving a total extraction in the neighborhood of 82 per cent., while a 3 per cent. loss on a 7 per cent. ore would represent only an extraction of 57 per cent.

Actual figures are very difficult to obtain; but the extraction is probably in the neighborhood of 70 per cent.

INTERNATIONAL COAL & COKE COMPANY, COLEMAN, ALBERTA.

GEORGE A. OHREN.

One of the most up-to-date coal mining outfits in the Crow's Nest coal fields is that of the International Coal & Coke Company, situated at Coleman, Alberta, on the Crow's Nest Branch of the Canadian Pacific Railway, half way between Fernie, B.C., and McLeod, Alta. It is now four years since the first coal was mined on their property and tested in two temporary coke ovens to ascertain its coking qualities. It is needless to say that the coal was found well adapted to coking purposes and fully up to the expectations of those who were interested. Then the company was duly formed and active work began. In the last few years the mine has been brought up to a producing basis of 2,000 tons daily. Of this about 1,600 tons of the coal is sold to the Canadian Pacific Railway Company for fuel purposes, and the balance is used to make 300 tons of coke per day, which is sold under contract to the Dominion and British Columbia Copper Companies in the Boundary district.

Much to the credit of the management, it can be truthfully said that the extensive plans for mining operations and installation of the plant, which have always been conducted with an eye to the future and an increased production, have fully met the requirements of that increased production, without any unnecessary changes or delays; and, while the coal field has proved to be very extensive, all operations up to date have been conducted on two openings.

On October 7th last the directors of this company declared a dividend of two per cent., payable November 1st. Heretofore the company has been paying one and one-half per cent. The two per cent. dividend will amount to about $56,000, there being 2,800,000 of the 3,000,000 one doller shares issued and 200,000 shares still in the treasury. The total dividends paid by the company up to date amount to around $154,000.

At the present time the company is executing development work on another of the rich seams which traverse the property. It is estimated that when this new seam is opened up and coal is being mined therefrom it will be possible to bring the output up to 3,000 tons per day. In addition to this work and the regular mining operations the company is building snok sheds over all of their railway tracks to facilitate the transportation of their product in the vicinity of their property. They are also building twenty new cottages for the accommodation of the coal miners, and an extension to the railway side track at Coleman, three-quarters of a mile long, all of which goes to indicate the spirit of advancement that prevails about the place.

It is estimated that at the present time there are 3,000,000 tons of coal developed on the property, and approximately 50,000,000 tons in sight. The measures are located in the Cretaceous and Laramie-Cretaceous formations, and are part of the extensive Crow's Nest field. From the point of the openings of the seams the mountain rises gradually, until at the face of the entries now being driven there is a height of coal of 1,200 feet.

View of Tipple I. C. & C. Co., Coleman, Alta.

Quite a little town has sprung up around the mines at Coleman, and there are now about 1,500 souls residing there. In the way of modern improvements they have a local telephone system, waterworks, carrying 140 pounds pressure, electric light, bank, churches, school, etc. Five hundred and thirty-five of the residents of Coleman are employed by the International Company, the last pay roll amounting to approximately $45,000.

The coal is of a bituminous grade and is coked in 176 bee-hive type coke ovens. These ovens are built 14 feet in diameter by 8 feet high.

The president of the company is Mr. A. C. Flumerfelt, Victoria; vice-president and manager, H. N. Galer, Spokane, Wash; secretary, W. G. Graves, Spokane; superintendent, G. L. Fraser, Coleman; purchasing agent, D. P. Oliver, Coleman; directors, A. C. Flumerfelt, H. N. Galer, D. M. Royers, D. Shultz and C. S. Houghton.

The labor situation at Coleman is all that could be asked at present. Perfect harmony prevails between the men and management. The men are working under a two years' contract, and it is not expected that there will be any interruption of operations during the life of this agreement. Average day's pay for inside work during the year 1906 was $4.85 a day. Outside common labor is paid $2.50. Machinists, engineers, carpenters, blacksmiths and other skilled laborers are paid from $3 to $4 per day.

The company has just completed a commodious wash and change room for the men. This room is 30 feet by 82 feet, with office, private baths and surgery. It is heated with steam and furnished with hot and cold water. There are 20 shower baths and expanded metal lockers in which each man can lock up his clothes.

The coal is loaded into the railway cars by an Ottumwa box car loader. The tipple has a capacity of handling 1,500 tons in ten hours. It also has a storage capacity of 3,000 tons—2,000 tons of coarse coal and 1,000 tons of slack. The slack is carried to the coke ovens by two six-ton Larry cars, electrically driven.

The total length of the main entry in No. 2 seam is 9,000 feet; that in No. 4 seam is 7,000 feet.

The 800 horse-power required to operate the machinery about the mine is derived from four 125 and two 150 horse-power boilers. The steam from these boilers operates a 4-stage Rand high pressure compressor with a capacity of 750 feet of free air per minute compressed to 1,000 pounds to the square inch. This high pressure air is stored in a pipe line reservoir and is principally used to drive three 6 inch by 10 inch and two 5 inch by 5 inch compressed air locomotives, the capacious storage tanks of which are charged from the pipe line with air at about 750 pounds pressure and which is in turn supplied to the cylinders through a small auxiliary reservoir at a much lower pressure.

The surface workings consist of a boiler house, power house, containing two 400 horse-power electric generators and the compressor; fan house, containing an electrically driven Capell fan, supplying 125, to 160,000 cubic feet of air; lamp house, containing 500 Wolff lamps; machine and blacksmith shops combined; store room, containing an average of $30,000 worth of fittings and supplies; stable, granary, etc.

While I do not know exactly what it costs the International people for their coal and coke, I can say that it costs about 90 cents to $1 per ton to mine and place coal on the cars in Crow's Nest district; coke costs most of them about $1.50 to $1.75, f.o.b., shipping point. The coal is sold at an average figure of $2 per ton for run of mine, and eupwards, depending on size of contract, and the coke at about $2.50 per ton and over at the mine. These figures are only approximate and conditions at different mines may alter them.

The future outlook for the Crow's Nest coal mines is good. They have a large market in Alberta and the other Eastern Provinces, in British Columbia, and a good market for their coal and coke in the States of Washington, Idaho and Montana.

THE PRODUCTION OF COPPER IN THE UNITED STATES IN 1906.

A Review of L. C. Graton's Paper, "The Mineral Resources of the United States."

The world's production (smelter output) of copper in 1906 was 1,596,973,700 pounds. In the fololwing table it is seen that the United States produced 57.47 per cent. of this, or about the same as the previous year. It is interesting to find Canada standing seventh in the world's copper producing countries:—

Country	Pounds
United States	917,805,700
Mexico	135,800,000
Spain	105,055,200
Japan	95,737,600
Australasia	81,200,000
Chili	57,668,800
Canada	57,030,400

The total ore treated in the United States was 19,743,000 short tons. The average yield of copper was 2.15 per cent. This tonnage includes certain ores which were mined and treated primarily for values other than copper. Leaving these ores (amounting to, 1,700,000 tons) out of consideration the average yield of copper was 2.5 per cent. The native copper ores of Michigan ran only 1.26 per cent. Excluding these the remaining copper ores gave an average of 3.65 per cent.

The ores mined primarily for copper yielded 0.015 ounce of gold and 0.882 ounce silver per ton.

About 26 per cent of the total ore tonnage was of "sufficient richness or of such favorable metallurgical character as to be smelted without concentration. The remaining 14,722,000 tons were concentrating ores, from which were produced about 2,985,000 tons of concentrates, the average concentration being slightly under 5 into 1. If the immense tonnage of milling ores of Michigan is excluded, the concentrating ores of the rest of the country exceeded the smelting ores by only a small tonnage."

Almost 75 per cent of the copper produced in the United States, first passes through the stage of copper matte, which is then further concentrated by converting or bessemerizing it into "blester" copper. Nearly 95 per cent. of the latter is subjected to electrolytic refining, both to recover the gold and silver that it contains and to remove deleterious elements. Of the three stages, mining, smelting and refining, in the transformation from copper ore to pure metal, it is the refined product which possesses most significance to the dealer and consumer, "the production of mines and smelters indicating possibilities of future months rather than final results accomplished to date."

The writer points out that copper mines in general do not fall in the class of "poor man's mines," so that it has happened that the most important copper mines in the United States are in the hands of strong companies. In 1906 four operators produced 720,000,000 pounds. These were: The Amalgamated Copper Company, the Calumet & Hecla Mining Company, W. A. Clark, and Phelps, Dodge & Company.

"Production at the principal mines is on a truly enormous scale, with ore tonnage and copper output of individual mining units ranging up to more than 2,000,000 tons and 100,000,000 pounds, respectively, with single milling plants of a daily capacity up to 8,000 tons, and with smelting plants turning out annually

90,000,000 to 175,000,000 pounds of copper each. To the magnitude of these operations almost as much as to the abundance of her natural resources, does this country owe her pre-eminence as a copper producer, with a record of over half the world's production" .

C. W. K.

TREATMENT OF LOW-GRADE COPPER ORE.

JAMES PARKES, B.A.Sc.

The occurrence of many deposits of low grade copper ore between Sudbury and Sault Ste. Marie, as was stated in the issue of February 1st, 1908, of THE CANADIAN MINING JOURNAL, as well as some promising ones between Sudbury and North Bay, opens up a wide field for reduction works that will enable the mining companies to dispose of their ore.

The development work done on any of these deposits does not justify the expenditure of the large sum required to erect reduction works on the property. It is obvious, however, that this low grade ore, unlike the rich ore of Cobalt, cannot be shipped to other parts of Canada or to the United States for treatment, but must be treated fairly near the district in which it is mined.

It might be supposed that the excessive freight rates might be avoided by concentration at the mine and shipment of the enriched product. However, the concentration would involve enormous loss of mineral and the method has yet to be discovered by which this loss may be avoided.

Granted, therefore, that the ores must be treated in the district, it is necessary to examine the character of the ore and the mining conditions in order to determine the method best suited to meet these circumstances. The methods which suggest themselves are the smelting or fire process, and the lixiviation or wet process.

In order that an ore may be suitable for smelting it must, especially if low grade, be self-fluxing, or nearly so. Cheap fuel must also be obtainable. These ores, running usually from four to five per cent., have neither of these advantages. They almost invariably consist of copper pyrites with a gangue of quartz and iron pyrites. The large amount of fluxes required to smelt such an ore, together with the high cost of fuel, make direct smelting prohibitive. If first concentrated, the enriched product would still be difficult to smelt, while the heavy losses occurring during concentration would also add to its unfitness.

In the lixiviation process two conditions are most important. The gangue must be fairly insoluble and the valuable mineral easily soluble, or at least of such character that it may be converted into a soluble condition. It will readily be seen that an ore with copper pyrites as the valuable constituent and the quartz and iron pyrites as the gangue, fulfills both conditions. The quartz vein matter is almost completely insoluble, while by roasting the iron pyrites is converted into the oxide and rendered fairly insoluble in dilute acid or any other solution that may be employed. By roasting the copper pyrites is made easily soluble in very dilute acid, in fact the greater part of the values may be extracted without the addition of any acid whatever. Another important fact about this process is that the fumes evolved in the roasting of the pyrites may be condensed, thus supplying all the acid required for the lixiviation. It might also be added that the cost of erecting such a plant would be almost fifty per cent. less than that of erecting a smelter.

The only company that is as yet working along these lines is the North Ontario Reduction & Refining Company, Limited, at Sturgeon Falls, Ont. They will dissolve the copper according to the method already outlined and precipitate electrolytically. An alternating method of precipitation is afforded by the well-known action of scrap iron on copper in solution. The iron which nearly always exists in the solution will be precipitated and sold as a pigment, thus making a valuable by-product out of what would be thrown away in any other process. By this method all the silver and nearly all the gold, which might exist in the ore, would be thrown into solution and collected from the bottom of the precipitation tanks. The tailings by the addition of Portland cement form an admirable concrete, and would be valuable for road building.

The importance which the treatment of these low grade copper ores bears to the prosperity of Northern Ontario leads the writer to suggest it as a profitable subject for discussion by the contributors to THE CANADIAN MINING JOURNAL.

BOOK REVIEWS.

THE METALLURGY OF IRON AND STEEL. BY BRADLEY STOUGHTON, B.S., PH.B., ADJUNCT PROFESSOR OF METALLURGY, SCHOOL OF MINES, COLUMBIA UNIVERSITY. 500 PAGES, 6 x 9. PROPERLY ILLUSTRATED. $3.00 POSTPAID. HILL PUBLISHING COMPANY, 505 PEARL ST., NEW YORK.

There are two errors into which the writer of a scientific text-book is prone to fall; the error of indulging in excessive detail and the converse mistake of omitting explanations that are essential to those for whom he has written.

Mr. Stoughton appears to have avoided both these pitfalls. His aim has been to prepare a text-book adapted not alone to college work, but to the needs of the civil, mechanical, electrical, metallurgical and mining engineers. There are, of course, incidental shortcomings. But, in the main, the author has accomplished his object. He has contributed to the literature of iron and steel a needed and valuable volume.

The first chapter is taken up with definitions of cast iron, steel, and their various commercial modifications. Here also is given a list of general text-books, reference books and periodicals on the metallurgy of iron and steel.

Chapter II. outlines the manufacture of pig iron. Blast furnace fuels and fluxes are described. The varieties and distribution of iron ores are noted. The deposits of the United States are mentioned, along with notes on transportation and mining. The handling of raw material at a modern furnace and the blast furnace itself are the next subjects touched upon. The following sections on smelting practice and chemical reactions are particularly good. In a paragraph on dry blast, J. E.

Johnson's ingenious explanation of the great economy effected by desiccating the blast is referred to. Allusion is made to the skepticism with which the results of James Gayley's innovation were received. The apparently disproportionate saving in fuel and improvement in practice are explained by showing that every blast furnace has a certain "critical temperature," below which it will not perform any smelting, and that the theoretical temperature of combustion of the smelting zone is only a little above this "critical temperature." The standardizing of the air blown into the furnace by the removal of moisture, which otherwise enters in large fluctuating amounts, increases the interval between the critical temperature and the temperature of combustion, and thus renders more heat available.

Further details of furnace accessories are succeeded by four pages devoted to the calculation of a blast furnace charge. Here the author has skillfully simplified the usual methods of calculation. Whilst the method given is largely empirical, yet the functions of each constituent of the charge are made sufficiently clear. Possibly the introduction of a few standard factors would have enhanced the value of this section.

The succeeding chapter, Chapter III., is unique. It is entitled "The Purification of Pig Iron." As an introduction to the fuller treatment of the Bessemer process, open-hearth practice, puddling, etc., it sketches in a masterly way the relations of these processes to the blast furnace and to each other. Short as this chapter is, it gives a better idea of these branches of the iron and steel industry than I have found in any other treatise. It is supplemented by a list of references to standard works.

The manufacturing of wrought iron and crucible steel, the Bessemer process, the open-hearth, the mechanical treatment of steel, iron and steel founding, the solution theory of iron and steel, the constitution of steel, and cast iron, malleable cast iron, heat treatment, alloy steels, corrosion, electro-metallurgy, and metallography are treated in the remaining chapters.

The last chapter, within the limits of thirty pages, gives a very condensed statement of the basic principles of chemistry and physics. The author's intention is to convey to the reader, who has had no grounding in these sciences, a working knowledge of both. This, obviously, is an attempt at the impossible. Still the chapter will serve the purpose of refreshing memories grown rusty from disuse.

Mr. Stoughton is not merely an academician. He has occupied responsible positions with manufacturing concerns. Hence he writes with freshness and vigor. He has endeavored to describe and co-ordinate all the branches of the manufacture of iron and steel. To say that he has not failed is praise. But Mr. Stoughton merits more than this. His book outranks any extant text-book upon the metallurgy of iron and steel. Its plan is broad and comprehensive; its execution is satisfactory.

MEN WHO SELL THINGS — BY WALTER D. MOODY. A. C. McCLURG & COMPANY, CHICAGO.

A crisp, readable book. Those of our readers whose vocation is the selling of mining machinery and supplies, or the products of mines and smelters, will find here much good, practical advice. Whilst the book is replete with commercial colloquialisms, it is not otherwise inelegant in diction.

MARTIN'S MINING AND WATER CASES OF BRITISH COLUMBIA, WITH STATUTES—BY THE HONORABLE MR. JUSTICE MARTIN, OF THE SUPREME COURT OF BRITISH COLUMBIA, AND THE JUDGE IN ADMIRALTY FOR THAT PROVINCE. VOLUME II. PART II. PRICE, $7.50. THE CARSWELL COMPANY, LIMITED, TORONTO.

In Volume I. and in this and the preceding part of Volume II. are to be found all the reports of Mining Cases and of Water Clauses Consolidation Act Cases of British Columbia from the earliest time up to January 1st, 1908, in all the courts and from the trial up to the Privy Council. Here also may be found all the mining statutes of practical utility covering the same period. In addition to much other information, we notice all the reported Yukon Mining Cases decided by the Supreme Court of Canada.

In this part of Volume II. the interesting case of the Star Mining & Milling Company v. Byron N. White Company is summarized.

EXCHANGES.

Science and Art of Mining, January 25th.—In an article on "Roof Action in Long Wall Work" the writer states that "the roof near the working face may be conveniently divided into three zones: (1) The dead roof; (2) the moving roof; (3) the pulled roof." Two essentials to the success of long wall work are, that all timber should be withdrawn behind the face timber; that the cogging should be made as compact as possible, the front wall rocks being bedded in loose material that will fill all crevices, and the insides completely filled. Of the moving roof the following analogy is made:—

The total action of this moving roof may be compared to that of a cantilever; that is, a beam supported at one end, but free at the other. One end of the cantilever roof is on the coal, the other on the yielding timber and cogging. Due to the great weight of the absolute roof this cantilever is constantly being broken (that is, pieces, so to speak, are being broken off its free end), and it is one of the essentials in successful working that these fractures should not take place at the working face, but that the weight should be what miners commonly call a travelling weight, ever and ever being rolled back on to the solid coal.

PERSONAL AND GENERAL.

Mr. W. A. Carlyle is making a thorough examination of Le Roi mine. He will not leave for London until late in March.

Mr. James Monroe, a successful Yukon pioneer, came to Winnipeg with the Dawson curling team to compete at the Winnipeg bonspiel.

Dr. Winthrop Spencer, F.G.S., who occupies a leading position among geologists, visited his native town of Dundas, Ont., last month.

Mr. Frederick Bolton, who had considerable interests in the Manitou gold district of Ontario, died recently in Blackpool, England, aged 61 years.

Mr. J. E. Jones, of Camborne, B.C., has been appointed official liquidator for the Silver Dollar mine and mill, owned by the Elwood Tin Workers Gold Mining Company.

Mr. J. A. Robertson succeeds Capt. Harris as manager of the McKinley-Darragh. Mr. Robertson was formerly with the Diamond Drilling Company.

Mr. Frederick Norton Coombs, a well-known mining engineer, largely interested in Cobalt properties, was found dead in bed in his apartments in Buffalo on February 9th.

Dr. Henry T. Bovey, Dean of the Faculty of Applied Science of McGill University, Montreal, has been appointed Rector of the Imperial College of Science and Technology, London, England.

The engineering department of Manitoba University, Winnipeg, was opened on February 10th, Prof. E. E. Brydon-Jack delivering the inaugural address, dealing with the work of the engineer and the progress of engineering education.

Mr. Malcolm Stewart and Mr. John Dorsey, underground managers of Sydney No. 1 colliery of the Dominion Coal Company, were instantly killed on February 13th by the fall from the surface of the steel cage used in sorting coal.

Mr. T. T. Fulton, of the Londonderry Iron & Mining Company, Londonderry, N.S., has left for Bathurst, N.S., with a staff of assistants. Mr. Fulton will survey and prospect the Bathurst iron ore properties of the Drummond Mines, Limited.

Mr. J. Dix Fraser, formerly superintendent of the Dominion Iron & Steel Company, has been selected by the Dominion Coal Company, as their representative on the Conciliation Board appointed to adjust matters between the Coal Company and their employees.

Mr. Joseph Irwin, of Ottawa, managing director of the Western Canada Cement & Coal Company, recently established at Exshaw, Alta., Mr. Frank Dunsford representing the English stockholders and Mr. Mackinnon appointed resident manager, arrived at Exshaw February 10th in connection with the starting of the works.

Mr. A. W. Robinson, M. Can. Soc. C.E., of Montreal, sailed from New York February 26th, having been commissioned to examine and report on the River Niger with a view to improvement of navigation by dredging. He has also in hand the design of dredging plant for the extensive improvements on the Upper Nile, which the Egyptian Government are entering upon for irrigation purposes.

The Robins New Conveyor Company, which has been recently incorporated, will be operated under the management of Thomas Robins, who founded the Robins Conveying Belt Company in 1896, and was president of that concern until March, 1907, when its management passed into other hands. The position of chief engineer in the new company is filled by Mr. C. Kemble Baldwin, who has served in the Robins Conveying Belt Company in the same capacity for the last seven years. The officers of the company are at 38 Wall street, N.Y., and 1240 Old Colony Building, Chicago.

A hard coke, with about the heating value of coal, and a half-formed coke, soft and burning freely, are made by distilling peat at Bodkino, Russia, 25 or 30 tons each being produced daily by eight furnaces. Having little sulphur, the fuels have an advantage for iron-making. The gases distilled off are burned in the furnaces, and the tar and ammoniacal by-products are valuable.

CORRESPONDENCE.

[The Canadian Mining Journal is not responsible for opinions expressed by contributors to this department.]

Editor's Note.—We have received many letters from subscribers, some of whom have approved and some of whom have disapproved our attitude in matters affecting the Canadian Mining Institute. Mr. Hill's letter is the first sent us for publication. As may be gathered, without difficulty, Mr. Hill holds that the Journal has erred. Our position has been well enough defined to require no further explanation. Therefore we print Mr. Hill's letter without further comment.

Nelson, B.C., Febrary 7th, 1908.

To the Editor, Canadian Mining Journal,
Toronto, Ont.

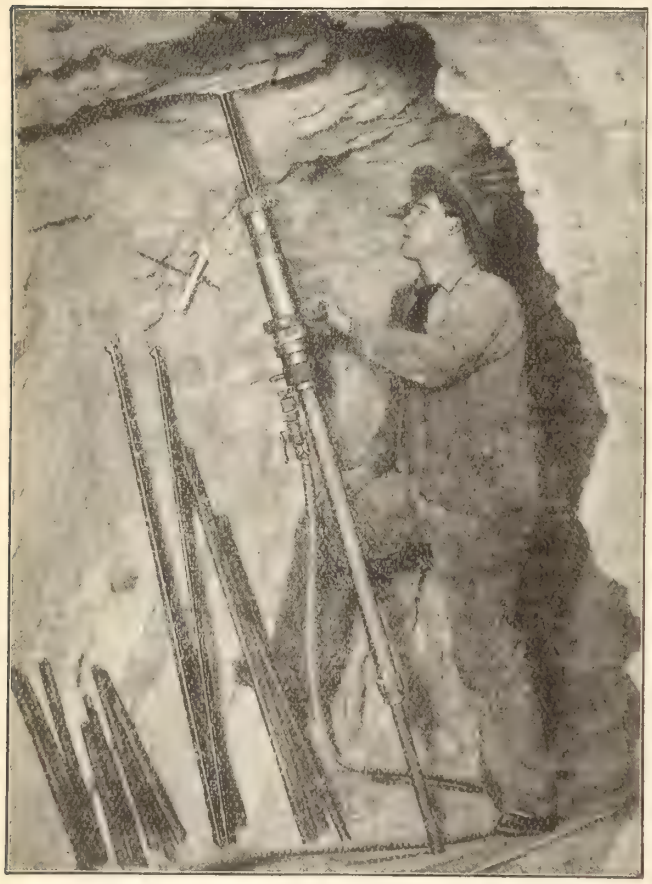
Sir,—It is unfortunate that certain members of the Canadian Mining Institute should have commenced a most uncalled for and unwise agitation against certain officials of the Institute. I have just received a circular signed by M. J. C. Murray, in which I find the following:—

> "It is believed that the movement to fill these two offices with technical men will appeal to all members of the Mining Institute."

Now I would enter a most emphatic protest against this assertion. A technical education does not qualify a man for the work of a secretary or of a treasurer. There are, of course, exceptions, but as a rule the higher the technical qualifications of a man the less fitted is he for secretarial or business work.

In this particular case it seems that the present Secretary of the Canadian Mining Institute, Mr. Mortimer Lamb, and the Treasurer, Mr. Stevenson Brown, have filled the positions of Secretary and Treasurer with credit to themselves and to the satisfaction of the officers of the Institute. The circular signed by the President and four Vice-Presidents of the Institution is ample testimony to this, and should be sufficient for all unprejudiced members of the Institution. The membership has been largely increased, the finances are in good shape, and a large number of valuable papers have been contributed by members and printed in the transactions. It seems to me a mean, dishonorable thing to agitate for the dismissal, without adequate cause, of officials who have done good work for the Institute, and I trust that the members of the Canadian Mining Institute will not countenance such action.

Whether the offices of Secretary and Treasurer would be better filled by technical or by untechnical men may be a matter of opinion, but I think there can be no doubt that these dissensions among the members of the Institution, these agitations by cliques, are very detrimental to the best interests of the Institution. If the Canadian Mining Institute is to be the influential and successful institution, which it ought to be in a mining country like Canada, the members must all work together for the good of the Institution and must loyally support the Council and officers of the Institution.



Trusting that you will find space for this in your paper, I am yours faithfully,

Leslie Hill.

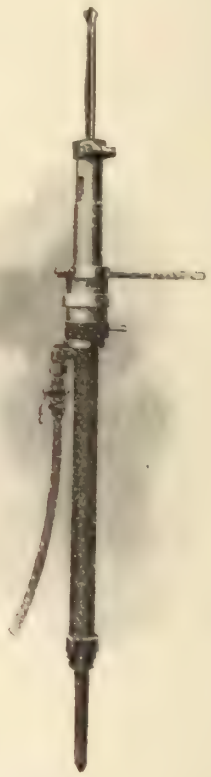
MINING MACHINERY NOTES.

The Sullivan Hammer Drills for Mining Work.—large pneumatic rivetting or chipping hammer. In its operation it differs from the ordinary machine drill in that the bit is held against the rock, and the hammer hits the shank end of the steel twelve hundred or more blows per minute. The drill is rotated by hand. For up-holes an air piston supports the machine and feeds it automatically. On flat and down-holes the operator feeds by hand.

For overhead work in stopes and raises; for special sinking operations; and for trimming, cutting hitches, and drilling pop-holes the hammer drill has been proved superior to the ordinary reciprocating machine drills.

Sullivan "D-21" Hammer Drill in operation.

For usual sinking work and for drifting this is not the case.



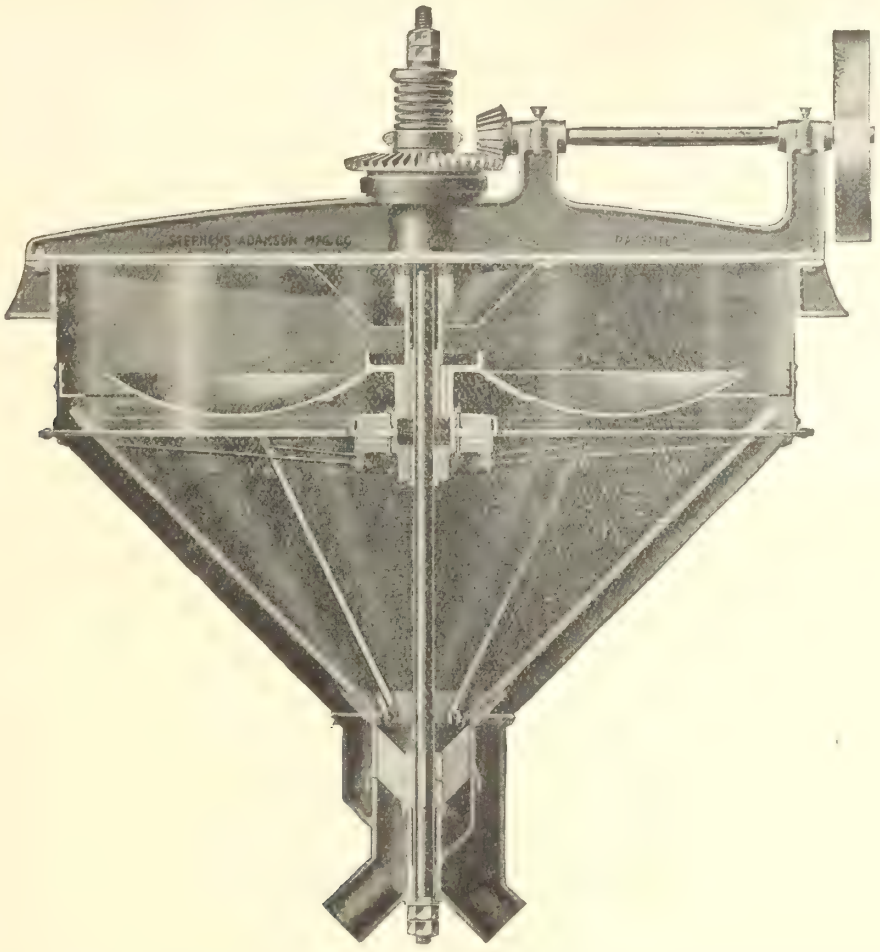
In stoping out narrow veins, the lightness and compactness of the hammer drill are obviously advantageous. No tripod column or other mounting is required. They can be handled by one man and can be carried anywhere by him. Their flexibility enables the drillman to place his holes so as to ensure economy of time and powder. Time is saved, also, in changing steels, as a new length can be inserted almost instantaneously.

The "D-21" air-feed hammer drill has a two-inch cylinder, weighs 70 pounds complete and consumes about 45 cubic feet of free air per minute at 80 pounds pressure. It is intended for raising and stoping, where all holes point upward. It is claimed that the Sullivan "D-21" can drill up-holes 25 to 50 per cent. faster than can reciprocating drills. They cannot, however, work well in wet and sticky ground, where the cuttings pack around the bit. Using a 1 3-4 or 2 inch starter, eight-foot holes, large enough for one-inch powder can be drilled.

Solid one-inch cruciform steel is employed. No shank is needed. The shank end is merely given a slight temper. This steel sharpens easily and allows the cuttings to run out freely.

All parts of the machine are light, strong, compact and accessible.

"D-15" and "D-19" are respectively light and heavy hand drills. The former weighs 18 pounds, uses 20 cubic feet of free air per minute and drills holes three feet deep, large enough for 7-8 inch powder. The latter



Sullivan "D-21" Air-Feed Hammer Drill—For drilling up-holes only for raising and back stoping.

weighs 30 pounds, consumes 35 cubic feet of free air per minute and will drill to five feet by using hollow steel and employing an exhaust for cleaning the holes.

"D-15" is widely used for block-holing, cutting hitches, and trimming. "D-19" is most useful for shaft sinking under favorable conditions.

The "Vibracone" Separator, manufactured by the Stephens-Adamson Manufacturing Company of Aurora, Ill., is described in their monthly publication, "Conveying and Transmission. The "Vibracone" separator requires less than one-half horse-power and will screen any product that can be separated by a revolving or vibrating screen, either wet or dry, from 1-2 inch to 200

meshes per inch. In actual practice it has screened 10 tons of Portland cement clinker per hour, 99 per cent. of which would pass a 20-mesh screen, giving tailings not in excess of 10 per cent. The screen cloth is of heavy wire about twice the size of the product desired. In screening, for instance, material that will pass a 20-mesh screen, a 10-mesh No. 20 wire screen is used. This gives a long life to the screen. The "Vibracone" can be used for handling cement, lime, clay, ores, sand, fine coal, carbon, graphite, stone, salt, etc., etc.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay.

The first half of February has been marked by two sad accidents in Cape Breton mines, namely, the Port Hood explosion and the cage incident at Sydney Mines.

The Port Hood disaster occurred about seven a.m. on February the 7th, and resulted in the instantaneous death of ten men, four of whom were Bulgarian loaders, unable to speak English. From the evidence given at the inquest there appears to have been a small accumulation of gas caused by defective bratticing, but there does not appear to have been such a quantity of gas as would account for an explosion of such violence, and many circumstances point to an explosion of powder in an explosive mixture of gas and air, aided by the coal dust present.

The use of open lights was permitted in the mine, and also the use of loose powder, two cans of which containing 12 pounds are said to be missing. The testimony of the witnesses and of the men's officials who inspected the mine after the explosion is that the underground workings were well kept and in good condition. No doubt this was the case, but it is to-day accepted as an axiom that no mine is so safe that open lights can be used without danger.

The manner in which old miners cling to the idea that their efficiency is lowered and their wage earning capacity is impaired by the use of safety lamps would be amusing were it not so fraught with dreadful danger to themselves and their comrades. Some mines may be termed non-gassy, but this is only a comparative term, and it is every day becoming more certain that gassy or not gassy, the more or less hypothetical influence on wages of the closed lamp as compared with the naked light is not to be weighed in the balance for one instant against the general safety of the mine. What is the extra cost of safety lamps or any fancied inconvenience which may result from their use when compared with one mine explosion or one mine fire in its financial aspect? Safety lamps are the best insurance premium in a mine. A seam of coal is a layer of inflammable material containing occluded gases in more or less volume; being underground, the means of escape are limited, and the means of ventilation are restricted by th confined area; the necessity of keeping up the roof gives rise to the presence of more inflammable material in the shape of timber, and the grinding of the coal in the haulage boxes and by the traffic of the mine creates a dust which can be detonated. These conditions vary in degree, but not in kind. A non-gassy mine may at any moment become a gassy one, and in underground

conditions nothing is so certain as danger: safety being, as we said before, merely a comparative term. Viewed solely as a preventive of fire, apart altogether from the danger of gas and dust explosions, safety lamps are advisable in a mine. The Port Hood disaster is one more case in point.

The presence of the four Bulgarians in this death roll leads to another consideration. In the hands of careful and experienced miners the naked light may have been permissible in some mines, but when it is found necessary to introduce unskilled men naked lights become a standing menace and disaster is only a question of time. We are not discussing the advisability of introducing foreign and unskilled labor into our mines. This has arisen because of necessity, and from no other cause. But their presence means additional care in supervision . To be frank, the juxtaposition of naked lights, loose powder, and laborers unable to speak English, is unhealthy to say the least, and so it proved.

The other accident caused the death of two of the most valued officials of the Nova Scotia Steel Company, namely, Underground Managers John Dorsay and Councillor Malcolm Stewart. The men were about to descend the No. 1 mine on the 13th of February when, by some error, the cage was sent up into the headframe, where the Walker safety catch acted and released the hoisting rope. By some means, however, not yet explained, the catches failed to hold and the cage went to the bottom, a drop of 700 feet. This is the first accident of its kind in the whole thirty-one years that No. 1 colliery has been working. The death of two officials of such importance and worth has caused universal mourning among the mining community at Sydney Mines. A sad feature is that Mr. Dorsay leaves ten children. No doubt an enquiry will be made into the failure of the safety hook, which at present seems to have been a pure accident. These safety hooks are called into operation oftener than may be supposed, and it is only very rarely that they fail to act.

Mr. J. W. Devison has resigned as manager of Dominion No. 1 colliery, which position he has occupied since 1905. Previous to that Mr. Devison was manager of International Mine (Dominion No. 8). His successor is Mr. James D. Maxwell, lately manager of Dominion No. 2 and 9. Mr. Absalom Beaton has been appointed manager of No. 2 colliery (Phalen Seam), and Mr. John J. McNeil manager of No. 9 colliery (Harbor Seam).

The Dominion Coal Company have lately been unfortunate with their stores. The Glace Bay store was gutted by fire on the 23rd January, and the Dominion No. 1 store was entirely destroyed by fire on the 4th instant. The total loss is somewhere about $50,000, fully covered by insurance.

It is now being realized by some who made railing accusations against "Company's stores" that they are not altogether an unmixed evil from the standpoint of the employee. One thing is certain, that they are a powerful weapon in the hands of the coal companies with which to protect their workpeople against the exactions of unscrupulous tradesmen and local combines, and that they tend to keep down the cost of living is undeniable. This is the secret root of the opposition to them, such opposition being engineered so as to appear as if it emanated from the workpeople. The only valid objection to the company's stores is that in the past they have been too lenient in the matter of credit and have laid themselves open to the accusation of encouraging thriftlessness. Under the present regime this is decidedly not so. The fact that throughout the present winter the stores of the Dominion Coal Company have sold butter at from 30 cents to 32 cents per pound against from 33 cents to 36 cents per pound charged by other merchants should tell its own tale. Men who think do not usually quarrel with their bread and butter. If the coal companies apply their vast organizations and purchasing powers to the cheapening of the cost of living for their workmen, where is the iniquity of company's stores? The day when the vicious practices that antedated and led up to the Truck Acts could be carried on has gone by, and such practices have never been in existence in Cape Breton since the advent of Dominion Coal, and probably never before.

Although it is February, and it is supposed that no intoxicating liquors are being sold in Cape Breton, if one may believe the inspectors, the problem of the "pay-day drunk" is still with us. A few actual figures may illustrate its effect on the operation of the mines. The average daily output of the Dominion Coal Company's mines from the 27th January to the 31st inclusvie was 13,200 tons. Saturday, the 1st February, was pay day, and the average daily output from the 1st to the 8th, inclusive, was 9,800 tons per day. From the 10th to the 15th, inclusive, the output was an average of 11,500 per day. The day before pay day, that is the 14th, the output was 12,300 tons. Saturday, pay day, produced 9,200 tons, and Monday, the 17th, produced only 9,000 tons. The difference between these figures is attributable to the effects of pay day and nothing else. A fair estimate is that 14,000 tons per month is lost in outputs by mey staying off after pay day. The curve of outputs when plotted resembles the Alps, being a steady rise for thirteen days after pay day to a maximum height the day before pay day. Then comes a fall, which takes another fortnight to overcome, and this kind of thing is a continuous performance. And the amusing part of it is that theoretically Cape Breton County is *dry*. If this be done in a *dry* county, what will be done in a wet? The Scott Act was sufficiently farcical, but the solemn assurances given us periodically by inspectors—all honorable gentlemen—that no liquor is being sold and that the *lid* is on, have a flavor of comic opera. There is a humorous side to the matter, but it does not appeal to the colliery manager. Unfortunately, outputs are dreadfully practical things, and it is no comfort to a manager to know that his town is theoretically dry, when actually in cold truth perhaps one-tenth of his men are recovering from a drunk. It is not everywhere in Canada that men can afford to loaf in this fashion. It is hard to sympathise with tales of low wages and demands for advances in wages from men who will lose time in this way.

The formation of the Conciliation Board to adjust the differences between the Dominion Coal Company and their men in the matter of wages is now complete. Dr. Arthur Kendall will represent the men, Mr. J. Dix Fraser will represent the company and the chairman, and the third member of the Board is Prof. Adam Shortt, of Kingston, Ont. It is not likely the Board will meet before the 24th.

Port Hood.

The following is a summary of the evidence of John Moffatt, Grand Secretary of the P. W. A., a competent authority on conditions of coal mines and mining:—

"We mutually examined the balance inside on the north side of No. 3 level. Found debris on the high level outside of the balance, two little walls about 150 feet, and on the other level a little more. The mine is in a very nice condition, it is a very nice little mine, in fact it is in a splendid condition, well timbered, roadways are kept well and clean. The roof generally seems to be a very good roof, and the timber used is large and well put up. The ventilation is very good, in fact ice was found along No. 3 level south, and in the cans. The air is well conducted, the doors and steppings are firmly placed in the cross cuts and ribs. I found the condition of the mine, without a doubt, much better than the other mines of the province. The airways are all well placed, and the air well split and divided up. The air was also so properly conducted."

ALBERTA.

Taber.

It is reported that Spokane men have bought 440 acres of coal land at Taber for the sum of $75,000. A company under the

name of the Stanton Coal Mining Company, with a capital stock of $125,000, has been organized to develop the property. It is stated that it is the intention of the company to put the product of the mine on the Spokane market.

Dissatisfaction still continues at the rate of wages paid in some of the small mines in the Woodpecker district, near Taber, and it is probably that a Board of Investigation under the Lemieux Act will be formed to settle the wages question.

EDMONTON.

The Morinville mines, owing to the lack of market cause by the mild weather, have closed down No. 1 and 2 shafts. Only No. 3 shaft will be operated to supply the Canadian Northern Railway. No. 3 shaft is sunk in the centre of the coal basin, and can therefore be more cheaply operated than the other two shafts, also as this was the last shaft to be sunk it is better equipped and can handle the coal to better advantage. The miners' union officials complain that the company is keeping on single men and turning off married men, but the real state of affairs is that the company is dispensing with the services of the men who are discontented with their wages and are agitating for advances. This is the inevitable result of slack trade; "the kickers" are the first to be laid off.

Two very important bills have been introduced in the Alberta Legislature this session. The one is an "eight hours bank-to-bank" bill for miners, and the other is a workman's Compensation Act. Hon. W. H. Cushing, Minister of Public Works, introduced the former, and Hon. C. W. Cross, the Attorney-General, introduced the latter.

Hon. Mr. Cushing gave a long and interesting speech on the eight hours bill on the introduction of that measure. He cited the various laws in European countries limiting the hours of labor underground.

Several acts regulating hours of employment had been passed in the States, but these had been declared unconstitutional owing to the constitution in the United States making interference between contracting parties impossible. Hon. Mr. Cushing showed from satistics how in England, where the hours of labor were longest, the number of accidents was largest, and where the hours of labor were shortest the number of accidents were fewest. In England when it was proposed first to reduce the hours of employment of boys underground the claim was advanced that the industry would be ruined, but instead the industry had prospered.

It was found that men working underground could do more or as much work in eight hours as they could do working ten hours per day.

The Act which it is proposed to bring into force on March 31st, 1909, is very comprehensive. Under its provisions a workman shall not be below ground for the purpose of his employment, or of going to or from his employment, for more than eight hours during any consecutive twenty-four hours.

The owner, agent or manager of every mine shall fix for each shift of workmen in the mine the times at which the lowering and raising of men from the mine is to be commenced, and completed in such manner that each workman shall have the opportunity of returning to the surface without contravention of the time set out in the Act.

A register is to be kept by the mine owner as to the times at which the men go into the mine and come up, and the workmen may appoint one of their number to see that the provisions of the Act are being complied with.

The making of any false entry incurs a penalty. There are certain exemptions as to furnacemen, pumpmen, horsekeepers and mine officials, men engaged in work in case of accident or in extensive repair work.

A repairing shift may also work an extra shift on a Saturday to prevent Sunday work.

The Act may also be suspended by Order in Council for a stated period in case of any emergency, such as a fuel famine, etc.

The Hon. C. W. Cross made a lengthy speech on the Compensation Act on the occasion of the bill being given its second reading in the Legislature.

This bill, "An Act with respect to Compensation to Workmen for Injuries Suffered in the Course of Their Employment," previously introduced by Hon. Mr. Cross, was explained by him at length. The bill has now been referred to committee of the whole, where in the usual mode of procedure it will be considered clause by clause, its details entered into and what amendments are desirable made.

The scale of compensation provided includes weekly payments during incapacity for injury not to exceed $10, as well as payments of a lump sum to defendants, on death of workman from injury, this sum not to exceed $1,500. Arbitration is arranged for fully, as are schemes of insurance or compensation upon which the employer and employed may agree. The bill is to a large extent similar to that in force in Great Britain, adapted, however, to the conditions in this province. Hon. Mr. Cross said, in moving the second reading of the bill: "The principle which underlies this Act is the same as that which underlies the various systems of workmen's insurance which have been in force in Europe for more than 15 years."

He went on to show how poor a chance a workman had to obtain compensation under the old Employers' Liability Acts.

Hon. Mr. Cross, proceeding, said: "The discussion evoked in the early eighties by the Employers' Liability Acts brought out the fact which had not hitherto been sufficiently recognized, that a large percentage of accidents were due either to chance or to occurrences practically beyond human control, or at least to causes the responsibility for which could not be located, and that under modern conditions the class of accidents that was due to the character of the industry itself was growing proportionately very much larger than the class of accidents which was due either to the employer or that of the employee.

"It was shown by statistics collected at that time that considerably over 50 per cent. of the accidents occuring in the various parts of Europe in industrial employments were traced to the character of the industry in which the workmen were engaged. That is to say, to the fact that it was more or less of a hazardous occupation, rather than to any specific cause, such as negligence in either the employer or employee.

"There did not seem to be any reason why the burden of accidents of this kind should not be made to constitute an item in the cost of production in the articles produced by such industry in the same way as any other item of cost in that production.

"The amount of compensation under this Act varies under different circumstances. In each individual case it has to be determined by the amount of the injured person's earnings.

"The amount of compensation payable in the case of a person's death from injury from accident differs according as to whether such person leaves:

"(1) No dependents.

"(2) Partial dependents.

"(3) Dependents wholly dependent.

"Where the deceased leaves no dependents then the compensation payable is limited to the reasonable expenses of medical attendance and burial, but in no case to exceed $100.

"Where he leaves persons partly dependent on him, the amount is fixed by agreement or by arbitration, according to the nature of the case.

"Where the deceased workman leaves dependents wholly dependent upon his earnings the amount of compensation payable

is a sum equal to his earnings in the employment of the same employer during the three years immediately preceding the injury from which he dies, or $1,000, whichever of these two sums is the larger. However, in no case is the amount to be more than $1,500.''

Mr. W. C. Simmons, the member for the mining district of Lethbridge, also spoke in favor of the bill and said that on the whole he felt that the bill was an admirable one, and would recommend itself to every fair-minded person in Alberta.

SASKATCHEWAN.

TAYLORTON.

John Galvin, vice-president of District 18, United Mine Workers of America, who is organizing the miners in the Souris coal field, has met with considerably opposition from the mine owners in that district. The union movement commenced with the workmen, who formed themselves into a local union and then made representation to District 18 of the U. M. W. of A. to be admitted to their organization.

The Taylor mines, the Manitoba and Saskatchewan Coal Company mines, and the Roche Percee Coal Mining Company mines are the chief coal-producing outfits in the district. At all three mines the men have been organized. Last week, as reported, strenuous objection was made by Senator Watson to the presence of Mr. Galvin, the organizer, on the property of the Manitoba and Saskatchewan Coal Company property, and now all men who have joined the union at the Taylor mine have been dismissed.

The bulk of the capital invested in the Souris coal field comes from Winnipeg, and a considerable quantity of the coal finds its way into the same city. The coal is also shipped as far north as Saskatoon, where it competes with Edmonton coal, and as far west as Moose Jaw, where it competes with Galt coal.

The coal is a lignite and, although not a high grade lignite, yet makes a good fuel for domestic use. It is also used as fuel at elevators and milling plants, and has been tried on locomotives, but without success in this latter case.

BRITISH COLUMBIA.

ROSSLAND DISTRICT.

The Centre Star Consolidated, Le Roi, Le Roi 2, Limited, and Evening Star mines are working and shipping steadily, the combined tonnage averaging about 5,600 tons of gold-copper ore per week.

Mr. W. A. Carlyle is now in the camp, and is interesting himself in Le Roi affairs. He is a man who has enjoyed a wide experience in copper mining, and no doubt his services will prove valuable to the Le Roi Company. At the Northport smelter but one of their battery of six furnaces is running at present, this furnace handling 200 tons of ore per day. Most of the ore smelted, of course, is shipped to the smelter from Le Roi mine, but they are also getting about 200 tons per week from the United Copper Company, of Chewelah, Wash, 50 to 100 tons from the First Thought, Orient, Wash., and 30 tons from the Queen, Salmo, B.C.

The Consolidated Company smelter at Trail is smelting about 5,500 tons per week. The receipts of lead ore for January were 3,682,594 pounds, more than half of which came from St. Eupene mine. The next largest shipper was the Vancouver, in Slocan, which is controlled by Le Roi 2.

BOUNDARY.

The Granby Company has been maintaining shipments since last writing with the exception of week ending February 12th, when owing to some extra work having to be done only 17,000 tons was sent to the smelter. The total shipments from the Granby's Phoenix mines for January were 74,203 tons. Figuring on the basis of 24 pounds copper per ton of ore, the Granby must have produced about 1,725,000 pounds of copper in January.

A few men were put to work in the Snowshoe mine early in the month and got out about 400 tons of ore, which was shipped to the Trail smelter. This was shipped to meet some special requirements at the smelter. When the Snowshoe is working full force the major portion of its output is sent to the smelter of the British Columbia Copper Company, and only about one-third is smelted at Trail. Snowshoe ore is valued as a flux at the Trail smelter, but it is situated 100 miles from the mine, whereas the British Columbia Copper smelter is only 16 miles distant. Nothing new has been divulged as to when the Snowshoe and British Columbia Copper properties will resume operations.

There is much talk in Greenwood anent a proposed 3-mile tunnel to be driven from some point near that city to Pheonix camp, tapping the ore bodies of the latter place at some 2,100 feet depth. The estimated cost of the project is $3,000,000, and the Greenwood City Council may bonus the proposition in the sum of $50,000. Messrs. Johnosn, Peacock and Armstrong, of the Crescent mines, in Skylark camp, are the promoters of the idea and think that they can get Chicago capital to finance the scheme. While this work would no doubt be a source of gratification to the owners of mineral claims which it would pierce, the writer is somewhat skeptical as to whether the thing would pay the promoters unless they can make a reasonable arrangement with the mining companies as to ore encountered, or unless they would be entitled to certain tunnel claim rights, such as enjoyed in parts of the United States, a point which the writer is unable to ascertain at this writing. One thing is clear, it would not pay the Granby and other Phoenix mining companies to ship their ore through such a tunnel.

Spokane people have acquired an interest in the Bertha Con. G. M. Company and intend to put a small plant on the property and work it. A recent shipment of 500 tons sent to the smelter gave returns of $55 per ton.

NELSON.

The Hall mines smelter and the Silver King mine here have passed into the hands of the debenture holders, and it is hoped that work will be actively prosecuted on the Silver King now and the mine and smelter made to pay. The Silver King mine paid well in the early part of its working days, but the ore was lost and the mine closed until lately when it is claimed the lode was again encountered. The smelter was built especially to treat Silver King ores and was never very successful as a custom plant for several reasons. The plant is a little out of date now, and will no doubt have to be remodeled before economical smelting can be done there.

The Vancouver group has leased the Wakefield mill from the Hewitt Company. The Hewitt Company expect to treat about 100 tons of ore per day in the near future and ship a couple of cars of concentrates to the Trail smelter.

Minneapolis capitalists have been looking over the Orebell and other Salmo properties. Salmo camp is busy just now. The Emerald recently shipped three cars of ore to Trail, the Nugget mine two cars, one of which assayed over $100 to the ton. Mining is quiet in the Lardeau. The Blue Bell mine is now employing about 100 men. The Argenta and La Plata mines still remain closed down.

EAST KOOTENAY.

The St. Eugene mine is working steadily, and is shipping 325 tons of ore per week to Trail, in addition to the quantity concentrated. A body of ore 40 feet wide and 300 feet in length has just been opened up on what is known as the ''2,000 foot

level'' of the mine. Mr. S. G. Blaylock, formerly of the Hall mines smelter, has succeeded the former superintendent, Mr. W. P. White.

At a recent meeting of the Sullivan Group Manufacturing Company, Mr. James Finley, formerly in charge of the mines, was appointed manager of the mines and smelter, and the head office was removed to Marysville from Spokane. It is certainly the best policy for the offices of a mining company to be right at the mines, as it is much more convenient for all concerned and certainly more economical.

CROW'S NEST.

Coal mining is quiet along the Crow's Nest Pass line, but the Crow's Nest Pass Coal Company and the International Coal Company are working regularly. The former company will make extensive improvements to their plant in the near future, with a view to augmenting their output. These additions will entail an expenditure of nearly one million dollars.

Work is proceeding at a good rate at the Hosmer mines of the Canadian Pacific Railway Company, where 200 coke ovens and a large tipple are being constructed. At the expiration of the coke contract between the Trail smelter and the Crow's Nest Pass Coal Company the Canadian Pacific Railway Company will supply that plant and all of its mines and western lines with its own products. As the output of its mines will be greater than its own consumption, the railway company will be in the market as a vendor.

The proposed legislation whereby the coal miners will be constrained to pay a tax of ten cents per ton on coal mined and of fifteen cents per ton on coke manufactured, instead of five cents on coal and nine cents on coke as heretofore, is causing considerable comment among the coal mining men. While it is only right that the province should derive some revenue from its rich coal and mineral lands, still, legislation in this direction should be tackled with due care and the already heavily taxed mining industry should not be made to bear a burden that will prove a detriment to its progress. The competition of Alberta coal mines and the view that prospective investors will take of it, together with the possibility of adding more to the two per cent. load now carried by the metal mines, through the coking and smelting industries, must all be carefully considered. However, there is little doubt but when the whole thing is threshed out legislation will be enacted that will benefit all concerned and the taxation will be placed on a more uniform basis than it was before.

We cannot be too emphatic in our exhortations to small investors in regard to buying stock in mining propositions that they know nothing about. The days of the ''wild-cat'' are not past by any means, and like the humble pussy of the domesticated variety, by means of its nine lives, is still with us. Just because the promoters secure a glowing write-up in some of the daily papers and show assay certificates running into high figures, does not say that the mine is a proposition that can be worked on an economical and businesslike basis. There are good mining companies who seek capital in this way, but those with merit are few and far between, and concerns who inform the possible investor that ''next month the stock will advance five cents per share'' and use like catch phrases are to be shunned. In fact, if one has not seen the property or had a report on it from some banker or commercial agency it would be better for them to keep their savings where they know they are safe and are earning the usual three or five per cent.

GENERAL MINING NEWS

NOVA SCOTIA.

GLACE BAY.—A circular issued by the Dominion Coal Company announces that J. W. Devison, manager of Dominion No. 1 colliery, has resigned. James Maxwell, manager of No. 2 colliery, succeeds him. Collieries Nos. 2 and 9 will hereafter be managed by two men instead of one.

Deputy Minister Mackenzie King arrived here last week. Mr. J. Dix Fraser is the representative of the company, and Or. Arthur Kendall, M.P.P., for Cape Breton, the men's representative.

The Dominion Coal Company have commenced sinking an air shaft at their new Dominion No. 12 colliery, and have quite a large force of men at work there. Superintendent of Mines Fergie said the company were well satisfied with the progress made at the new Victoria colliery during the past few months. He said the sinking of the new shaft was being carried forward with splendid results, and it was down to a depth of 535 feet. They were hoisting an average of 100 tons of coal daily at the new colliery. The company have had only about sixty men employed at No. 12 up to the present time.

The new long wall mining machine is in operation on the Phalen seam. It is a disc diamond coal cutter. The picks are attached to the sprocket itself and the chain is done away with.

HALIFAX.—Dr. A. S. Kendall, senior M.P.P. for Cape Breton, has given notice of a motion for the appointment of a commission to inquire into all the conditions of coal mining in Nova Scotia. The commission, if granted, will be instructed to ascertain, and make public, the present truth as to the following

1. The extent and conditions of the Province's asset in coal.
2. The conditions of coal mining leases.
3. The methods employed by promoters to form companies and to obtain capital.
4. The preparation of plans for new mining enterprises and extensions.
5. The methods of mining and losses of coal to the Province incident to mining.
6. The prices of coal in this Province and beyond the Province.
7. The remuneration of miners, provisions for old age, for injuries and dependents of miners.
8. The enforcement of laws intended to lessen or prevent accidents.
9. Further requirements to prevent accidents and to afford relief to victims or the dependents of victims.
10. And other matters relating to mining.

NEW BRUNSWICK.

ST. JOHN.—F. J. Jones, manager of the Dominion Iron & Steel Company, of Sydney, C.B., which has completed the negotiations and taken over the iron mines of the New Brunswick Iron Company, at Lopreaux, was in the city to-day, and said that men have already started at work drilling to locate the body of ore. Asked if it was probable that a smelter would be built on the new property, he said that was a matter for the future to decide.

ONTARIO.

COBALT.—During 1907 a complete plant was installed at the Nancy Helen. The strike delayed mining operations; but now the No. 1 shaft is down 125 feet. Two drifts at the 100 foot level, on two diverging veins, are in 40 and 44 feet respectively. The shaft will be sunk to 200 feet and levels started at 50 foot, 100 foot, 150 foot and 200 foot. Crosscutting will be continued at the 100 foot level to catch the Buffalo veins. Five cars of ore are on hand. A concentrator will probably be erected.

A strike was made recently at the Badger mine, in No. 6 shaft, on what is known as No. 9 vein. This shaft was sunk in calcite, where only cobalt was shown on the surface, but at a depth of 72 feet the vein is from four to eight inches in width, and shows plenty of native silver, argentite and niccolite.

During January the Nipissing Company shipped six cars of ore of 180 tons, containing silver estimated at $322,900 ounces, and valued at $166,000. This makes the second largest shipment in one month since January, 1907. In September, 1907, shipments amounted to 323,000 ounces, which marks the record for that year.

Shipments for the week ending February 22nd were smaller than usual. The City of Cobalt with 42,960 pounds, the O'Brien with 129,860 pounds, the Temiskaming with 56,250 pounds, and the T. & M. B. with 125,000 pounds, totalling 355,070 pounds, or 177 tons, made up the week's record.

Up to the middle of October last nearly five hundred companies had been incorporated for the purpose of carrying out mining operations in the Cobalt and Larder Lake districts. Four hundred and ninety-one companies received charters, and of these the great majority proposed to operate in the Cobalt district. The total capitalization of these companies totals $472,326,000. The total paid-up capital amounts to about $79,273,838. The total capitalization has been further increased by many added millions. A further analysis of the figures shows that of the 491 companies previously referred to no less than 240 were incorporated with their proposed capital set out as being a million dollars or over. In eighty-nine cases the capital was between $500,000 and $1,000,000; 104 between $100,000 and $500,000, and 60 under $100,000.

OTTAWA.—Mr. John Retallack and Mr. Louis Pratt, of Kaslo, B.C., representing the Boards of Trade and owners of lead mines in British Columbia, presented petitions to the Government on the 20th of February, asking for a renewal of the bounty on lead for another period of five years. The conditions asked for are different in many respects from those now in force. In 1903 the Government appropriated $2,500,000 to be paid in lead bounties between them and June 30th, 1908. The bounty was to begin automatically whenever the English price of lead fell to £12 10s. per long ton, and was to be paid at the rate of 75 cents per 100 pounds, or $15 per short ton, until the price of the British Columbia product reached £16, when the bounty would stop. This stimulate dand developed the British Columbia lead industry. But owing to the fact that the price of lead in England rose above the minimum £12 10s. soon after the bounty was inaugurated, and is now about £14, the bounty was partly inoperative. Consequently, by next June, when the arrangement expires, only $750,000 of the original $2,500,000 appropriated, will have been expended. The lead miners are therefore asking for a new appropriation of $2,500,000, and are requesting the the bounty begin when the English price is £14 10s. and cease at £18. Even this will afford but moderate protection to British Columbia. Lead produced in that province is shut out of the United States by a duty of $42 per ton, but receives very little protection in the Canadian market. The smelting charges in British Columbia are low. But the cost of marketing is heavy. The industry will be put on a firm footing and the market facilities wil lbe improved by Government assistance at this conjuncture.

ALBERTA.

CALGARY.—On February 12th a joint committee of mine operators and workers met in Calgary. The object of the meeting is the settlement of disputes. Mr. L. Stockett, of the Bankhead mines, is chairman. The union, the miners, and the operators are represented. The meetings are being held in camera.

BRITISH COLUMBIA.

FERNIE.—The pay roll of the three collieries of Coal Creek, Michel and Carbonado amounts to $185,236.25.

HOSMER.—The Hosmer Mines Company have expended to date $1,500,000. Shipments of coal will begin in 1908 and will be increased as the market requirements justify to 3,000 tons a day. The first installation of coke ovens will have capacity of 300 tons a day.

VANCOUVER.—The first shipment of coal from the collieries of the Diamond Vale Iron & Coal Company, in the Nicola country, has reached Vancouver.

ROSSLAND.—The main ledge of the Stemwinder mine was struck at the 500 foot level last week. It is 80 feet from the station, and men are now working their way through the ledge.

The Vancouver mine near Silverton is shipping zinc ore to Antwerp. Two more compressors are to be put in at this mine.

NELSON.—The Kootenay Engineering Works are installing their portion of the machinery for the Canada Zinc Company. The roaster has been rivetted and the whole plant will shortly be in readiness.

At a meeting of the Nelson Board of Trade it was resolved to telegraph the local member of the Provincial House, Mr. G. A. B. Hall, asking him if possible to obtain delay in the passage of the coal tax bill. The telegram was sent in response to representations made by the Fernie Board of Trade.

The Hall Creek Placers, ten miles south of Nelson, are to be worked this spring. All the claims will be consolidated under a large company. On one of the leases an hydraulic plant will be supplemented by a set of Wilfley concentrating tables.

NELSON.—The Hewitt Mining Company will commence milling ore within two months. The mill is awaiting the construction of a subsidiary tramway. Much of the material of construction has been manufactured in Nelson.

VANCOUVER.—The sending of a lot of Australian and New Zealand miners to the Marble Bay mines may give rise to trouble with the labor organizations.

NELSON.—Arrangements for the consolidation of the Krao with adjoining properties are almost completed. The Krao Company was floated last year on a $600,000 capital. The mine is at Ainsworth on Kootenay Lake.

The Consolidated Mining & Smelting Company has announced that owing to improved market conditions a reduction will be made in the smelter tariff for lead ores. The Trail smelter has been accumulating lead ore steadily, whilst the American smelters have refused it throughout the stringency.

BARKERVILLE. The Canadian Creek shaft was unwatered on January 2nd. It bottoms in two feet of clay. The Willow River Mining Company began breasting pay gravel during the latter part of January.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

Extensive alterations are being carried out at the Vale coal pit, Birtley Black Fell, England. A new winding engine has taken the place of one that has done service for 120 years, and the output will be increased from 480 to 900 tons per day.

The Newport Chamber of Commerce have unanimously expressed their condemnation of the mines eight hours bill. Newport is the third largest coal-exporting port in Great Britain, and it is asserted that the adoption of the measure would reduce the export by 750,000 tons per annum.

GERMANY.

The Eich Huttenverein, Le Gallais-Metz & Company, of Luxemburg, have decided to erect a larger electric steel works, with plant on the improved Kjelin induction furnace system. Experiments carried on for eight months with a view of producing special qualities of steel and steel castings have yielded favorable results. The output will be 250 tons per day.

The Hansa Coal & Coke Company, Bremerhaven, which has hitherto drawn its supplies from England, has contracted with the Rhenish-Westphalian Syndicate for 2,000,000 tons of coal.

The Prussian Government has introduced a measure authorizing the development of the coal properties in the Dortmund district, acquired by the State in 1902, by means of three new shafts and to raise 55,000,000 marks for the purpose.

AUSTRO-HUNGARY.

An investigation of the Rivers Drau, Mur and Danube, which have furnished much alluvial gold in Hungary, has led to the conclusion that in the Tyrol, Salzburg and Styria there must be numerous unworked gold veins.

AUSTRALASIA.

Gold dredging in the Bright district, Victoria, is yielding well, and it is expected that the value of the output for 1907 will run over £125,000.

Additions to the milling plant of the Waihi Gold Mining Company at Waikino, New Zealand, have been made on an extensive scale. When completed in March the treating capacity of all the company's mills will be about 30,000 tons per month, and the bullion output will reach £70,000. The power will be supplied by gas-producing engines of 1,000 horse-power capacity.

SOUTH AFRICA.

In accordance with an agreement with the De Beers Company, the Premier Company is about to shut down a tube mill and magnetite separator and part of the washing gear, which it is estimated will result in a reduction of the diamond output of 30,000 carats per month.

A cablegram from Pietermaritzburg, Natal, states that an explosion in a coal mine at Glencoe, on February 14th, buried five Europeans and forty natives. A rescue party of five Europeans and twenty five natives, headed by Government inspectors, went down, when another explosion occurred, burying them. All but eight natives were at last accounts supposed to have perished.

A dredger belonging to an English syndicate is operating on the Queen's River, Transvaal, just below its junction with the North Kaap river. It has a capacity of 1,500 tons per twenty-four hours.

JAPAN.

A combine of 32 owners of collieries in Fukuoka, Oita and Kumamoto prefectures has been effected, and a company organized under the title of the Dai Nippon Taeko Kaisha (Japan Colliery Company). They are endeavoring to secure a foreign loan for the improvement and extension of the mines.

The results of official investigation on the Japanese portion of the island of Sakhalien show that it presents a favorable field for mining enterprises. Concessions for the working of two coal mines have been granted.

INDIA.

The production of coal in British India has continuously increased since 1886. In 1878 it was 1,015,210 and in 1906 had risen to 9,783,250 tons. Ceylon and the Straits Settlements are the principal export markets.

TUNIS.

Mining made considerable progress in 1906 as compared with the previous year. The phosphate exports increased to the value of 18,000,000 francs as compared with 12,000,000, and the output of copper, zinc and lead ores also showed an increase.

UNITED STATES.

From the Deer Trail district in Eastern Washington tungsten ore is to be shipped to the Krupp people, Essen, Germany. About two tons per day is the output.

The rush to the new Nevada gold camp at Rawhide is said to be the greatest in the history of Pacific coast mining. Thousands from California and the East have been attracted since the middle of January. Other camps are being deserted and there were at last accounts some 3,500 people in the camp. The ore is claimed to yield very high values. It is quartz and porphyry, and most of the rich finds have been on the surface. The rock is somewhat porous and will prove a free-milling medium, running up well in gold percentages with very little silver.

Mr. Joseph A. Holmes, chief of the technological branch of the United States Geological Survey, has been delegated by the Government to make experiments, probably at Pittsburg, to devise some better means of protecting miners from gas and coal dust explosions in coal mines.

The output of ore from the Cripple Creek district for January was the largest on record since the labor troubles of 1904, amounting to 56,785 tons of a gross bullion value of $1,445,820, being nearly a quarter of a million in value in excess of the production of January, 1907.

MEXICO.

Since the first of the year about 400 men have been added to the working forces of the companies operating at Cananea, most of them being employed by the Greene-Cananea Company.

The Los Obates Mining Company, in which British capital is largely invested, has taken over the silver mine of J. Solis in the Obates mining district, Chihuahua, which has produced over $1,000,000. A concentrator will be added to the plant, which already includes a 10 stamp mill.

COMPANY REPORTS.

The first annual report of the Cobalt Lake Mining Company has come to hand. Pressure upon our space has made it impossible to give this important document editorial notice. In our next issue, however, such notice will be given. Meanwhile THE CANADIAN MINING JOURNAL'S congratulations are tendered to the working executive of that company. Pitfalls have been evaded and progress has been made. The managing director, Mr. D. B. Rochester, and the engineer, Mr. E. L. Fraleck, have won and maintained the confidence of the shareholders. This they have done in the face of some large and many petty discouragements.

Before discussing the body of the report it may be said that the JOURNAL has no sympathy with a certain class of obstructionists who are attempting, by means of legal technicalities, to block the progress of the Cobalt Lake Mining Company. If the claims of these men have even the color of genuineness they should have been settled or compromised long ago. If they have no just cause of complaint, they should be arbitrarily and forcefully quieted. The questions involved, also, could be settled by arbitration.

Under date of December 31st, 1907, the engineer, Mr. Fraleck, reports as follows:—

The work done on the company's property up to date consists of 1,393 feet, made up of 160 feet of raising, 567 feet of sinking and 666 feet of drifting.

"The north shaft has been sunk to a depth of 70 feet and a station cut at the 60 foot level. It is the intention to continue this shaft a further depth of 60 feet and prospect he north end of the lake by means of drifts at the 120 foot level.

"No. 4 shaft is 154 feet in depth with the first level at 86 feet. Three hundred and twelve feet of drilling and crosscutting has been done, comprising 60 feet of drifting on the No. 4 vein, 86 feet of drifting on the No. 3 vein, and 166 feet of crosscutting. It is the intention at the 154 foot level to drift across the lake on the strike of the No. 4 vein and crosscut to the No. 3 vein, which may then be opened up by a drift and rendered available for stoping in a manner similar to that on the first level.

"No. 6 shaft has attained a depth of 90 feet, with a station at the 70 foot level and a drift to the east on the vein 23 feet. It is the intention to sink this shaft an additional 40 feet and crosscut to the south end of the lake at the 120 foot level.

"These shafts will comprise our main working shafts, and to them the work at No. 1, No. 2, No. 3 and No. 5 will be subsidiary, for example (the company's No. 5 shaft is 100 feet in depth with a station at the 93 foot level) 42 feet of drifting has been done on the No. 5 vein, a crosscut run to the south a distance of 68 feet and to the north 139 feet. An additional 50 feet to the north will connect the No. 5 workings with those of No. 4, which can then handle the work of the No. 5 shaft and eliminate the expense of its maintenance.

"All of these shafts have been substantially timbered."

Mr. Fraleck's report is followed by that of the managing director, Mr. D. B. Rochester, who writes under date of January 17th:—

"Plant and Equipment.—The statement of present value, which stands at $37,365, consists of two 100 horse-power boilers, 13 drills cross compound air compressor with condenser, electric light plant, 3 air receivers, and a pipe line which covers our boundary from the north end of the lake to the McKinley-Darragh line, a distance of seven-eighths of a mile, with four hoists, pumps, drills and everything required for a first-class plant, hoist houses, ore houses, two blacksmith shopes, shaft houses, storehouses, water tank for fire protection, and all the accommodation necessary for housing and boarding 75 men.

"Development.—The entire development charges, amounting to $40,000, is more than covered by ore at present bagged and in the ore house, and nearly completes the most expensive part of our development, that is, the sinking of the shafts.

"Ore on Hand.—The amount of ore actually bagged and ready for shipment amounts to 52,000 pounds first grade silver ore, 30,000 pounds second grade silver ore, and 90,000 pounds of smaltite, niccolite and cobalt ore. This I will not attempt to estimate the value of, but feel satisfied that we have enough to cover all we have spent in development work.

"Conditions at Present.—It would be unfair to attempt to give an estimate of the value of the ore in sight, as it would be altogether speculative and not at all reliable. We have seven veins that we have done more or less sinking on, three of these are smaltite and niccolite veins that run from two to six inches in width, one niccolite vein, that we have drifted to at the 86 foot level and at that depth is from 26 to 28 inches in width, and has lessened in niccolite and increased in cobalt. This we are drifting to at the 154 foot level and hope at that depth to get good silver values. The other three are silver, cobalt and smaltite, and it is from these that we have taken nearly all our silver ore. We have at 80 feet struck a slate formation which continues for a depth of about 12 feet and changes again to conglomerate. In one instance we have lost our vein in this formation and, although we have gone below this for a considerable depth without recovering it, still, it may be either to the north or south of our shaft. The other veins we will drift to at the first level.

"Owing to the great activity in the camp in the summer of 1907 and the demand for the better or skilled class of labor, the work was more expensive than usual. The strike by the Western Federation of Miners on the 8th of July increased the difficulty and made it impossible to properly man the property for at least six weeks or two months.

"The Future.—Our aim is to get our shafts at the north and south end of the lake down as quickly as possible, so that we can drift under the lake at both ends and also at our No. 4 shaft, where we are now 154 feet in depth. We have at the south end the three veins of the McKinley-Darragh, and at the north end the prospect of the Right of Way vein. We have a first class plant in every particular, and has worked since its installation without a hitch, and to our engineer, Mr. Fraleck, is due the credit for its success. We have demonstrated beyond a doubt that Cobalt Lake can be mined from beneath with perfect safety. Our expense in the way of equipment will be small in the future as it will take the shape of expense maintenance and will be a charge against development instead of equipment as formerly. I have about completed arrangements for shipping a car of first grade ore to Copper Cliff, and expect to do so in a few days.

"We are having a survey of the property made, and a plan showing buildings and shafts, which will be submitted to you with this report."

The fact is mentioned that on the 25th of January, 1908, the first shipment of ore was made. This consisted of 53,878 pounds of first grade silver ore.

The report is accompanied by a not to artistic cut of the plan of the company's holdings.

The financial statement is given, thus:—

FINANCIAL STATEMENT FOR YEAR ENDING 31st DECEMBER, 1907.

BALANCE SHEET.

ASSETS.

Cash in Bank	$ 79,534.35	
Mine Plant and Equipment, inculding Buildings, Equipment, Power Plant, Office Furniture, etc., etc.,	39,340.02	
Suplies	1,658.09	
Insurance, unexpired	188.00	
Development Charges $39,940.00		
Ore extraction Charges 912.04		
	40,852.04	
Mine Property	3,635,000.00	
Profit and Loss	132,776.20	
		$3,929,348.70

LIABILITIES.

Capital Stock	$5,000,000.00	
Less Treasury Stock still to issue	1,070,834.00	
		$3,929,166.00
Accounts Payable		182.70
		$3,929,348.70

PROFIT AND LOSS.

EXPENSES. Including Preliminary, Prospecting, Legal, Camp and Head Office Expenses and Salaries	$ 27,431.48	
Depreciation on Equipment, etc.,	3,862.16	
Discount on Treasury Stock sold	106,124.90	
		$ 137,418.54
LESS.		
Interest on Bank balance	$ 3,603.09	
Transfer Fees Account	$ 1,039.25	
		$ 4,642.34
		$ 132,776.20

The annual meeting of the company, held in Toronto on February 21st, when this report was submitted, was pleasingly quiet. The next annual meeting is to be held in Ottawa. The old board of directors was re-elected with the addition of Mr. E. Marchand, as the representation of Eastern shareholders. Sir H. M. Pellatt was elected president and Mr. G. F. Henderson, vice-president.

RIGHT OF WAY MINING COMPANY, LIMITED.

At the annual meeting of the Right of Way Mining Company, it was announced that during the calendar year, ending December 31st, 1907, $70,000 had been paid out in dividends. In all, about $340,000 worth of ore had been taken out of the mine. This includes the $163,000 awarded to Right of Way in its dispute with La Rose mine. As the Right of Way mine cost only $50,000, its dividends are, at least, substantial. During 1907 the company sold ore to the value of $179,621.75. Net profits were $101,522.35. Two 7 per cent. dividends were paid, totalling $69,889.75. The profit and loss account shows a balance of $31,632.57. On plant and equipment $40,000 has been spent. The 25 per cent. royalty, payable to the Ontario Government, has amounted to $43,000.

The old Board of Directors were re-elected as follows: President, Mr. Geo. Goodwin; Vice-President, Mr. T. A. Beament; directors, Messrs. Edward Seybold, A. W. Fraser, and Dr. J. F. Kidd; Secretary-Treasurer, Mr. E. A. Larmonth.

NOVA SCOTIA STEEL & COAL COMPANY.

The annual meeting of the directors of the Nova Scotia Steel & Coal Company was held at the Windsor Hotel, Montreal, on Tuesday, February 17th. President R. E. Harris occupied the chair. After fully discussion of the profit and loss account, the statement of assets and liabilities and the general manager's report, the usual quarterly dividends of 2 per cent. on the preferred and 1 1-2 per cent. on the common stock were declared. These are payable April 15th, to shareholders of record, on March 31st next.

Although the New Glasgow works were closed for several weeks at the end of the year, yet the business of the company was the largest in its history. There was a considerable increase in the output of iron and steel, but a decrease in ore and coal. The steel shipments aggregated 53,632 tons, about 25 per cent. over the preceding year. A comparatively small amount of pig iron was sold, almost the whole output being converted into steel.

In May it was decided to single shift No. 3, colling, hence the quantity of coal mined was smaller than usual.

The profits for 1907 were $944,790.66, as compared with $960,281.03 for the preceding year.

The amount at the credit of profit and loss account on January 1st, 1907, was $1,180,783, which, with the profits of the year, makes a total of $2,125,574.55 to the credit of this account, on December 31st, 1907. Out of this the sum of $158,904.50 has been transferred to the credit of the special reserve funds, of which $50,000 is for general depreciation and renewals, $14,404.50 for blast furnace renewals (being 25 cents per ton on the output of pig iron during the year), and $14,500 for depreciation of the shipping property owned by the company, $5,000 has been set aside for a contingent liability in connection with accidents, and the sum of $75,000 has been placed to the credit of a special account for ore exploration and development. During the year these reserve funds were charged with the sum of $17,656.79 for new furnace lining, bosh plates, crucible jacket, etc., which are at present in stock, and will be used when the blast furnace is next re-lined.

The balance to the credit of these special reserve accounts is now $792,237.22, as compared with $650,989.51 at the beginning of the year.

The balance carried forward to the credit of profit and loss on the 1st of January, 1908, is $1,202,604.39, as compared with $1,180,783.89, on the first of January, 1907.

Sum expended.—The sum of $378,386.37 has been expended during the year on capital account, in equipping the new colliery at Sydney Mines, new forge buildings, at New Glasgow, the purchase of iron ore properities, the development of the submarine iron ore areas at Wabana, and for plant, improvements, etc.

During the year four quarterly dividends of 1 1-2 per cent. each on the common stock, and the usual quarterly dividends of 2 per cent. each on the preferred stock of the company, have been paid.

The annual report of the Dominion Coal Company to be submitted at the meeting early in March, is now being completed, and will show that the total output for 1907 showed a decrease of 75,000, as compared with that of 1906, which amounted to

3,552,746 tons. The money received from the Dominion Iron & Steel Company on the existing two years' contract is being placed in a contingent fund in case the old contract is maintained by the Privy Council, and the money will have to be paid back.

The Dominion Steel Company has issued the following statement:—

The supplementary annual report issued on 20th September last, contains a statement of the claim against the Coal Company, as itstood at the close of the previous month. The position of the claims, as at 31st December, 1907, exclusive of interest, is as follows:—

Paid for extra cost of coal purchased from Dominion Coal Company	$1,237,235.39
Paid for extra cost of coal purchased from others	402,721.43
Damage due for short deliveries in August, September and October, 1906.	132,252.75
Damages due to cessation of deliveries in November, 1906, estimated..	479,000.00
Total, as on 31st December, 1907, exclusive of interest	$2,251,209.57

Your directors have to report that the Coal Company has obtained leave to appeal from the judgment of the Supreme Court of Nova Scotia to the Judicial Committe of the Privy Council, in England.

Temiskaming directors have declared their first 3 per cent. divident. It is payable March 12th. The old boards of both companies were re-elected. The Temiskaming board is composed of: President, Louis Struber; Vice-President, Robert T. Shellington; and directors, Harvey D. Graham, Alex. Fasken, and Harvey D. Roberts, Mr. Graham is treasurer and Mr. Fasken secretary.

The annual meeting of the Cumberland Railway & Coal Company has been prostponed indefinitely. Mr. J. R. Cowans, the general manager, was in Montreal recently, but has returned to Springhill.

The annual meeting of the Dominion Coal Company will be held in Montreal on March 6th. Books close on February 21st to March 6th.

STATISTICS AND RETURNS.

CROW'S NEST PASS COAL SHIPMENTS.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ending February 14th, was 21,651 tons, or a daily average of 3,608 tons. In the same week last year the output was 20,219 tons, or a daily average of 3,370 tons. The output for the week ending February 16th, 1906, was 16,773 tons, or a daily average of 2,795 tons.

The output of the Crow's Nest Pass Coal Company for the third week in February, during the past four years, compares as follows:—

	Tons.	Daily aver.
1908	21,205	3,534
1907	21,488	3,581
1906	17,981	2,997
1905	18,457	3,076

Following are the shipments from Cobalt camp for the week ending February 15th:—

	Ore in lbs
Buffalo	63,750
Coniagas	65,440
Drummond	40,000
Kerr Lake	42,610
La Rose	59,390
McKinlley-Darragh	386,420
Nipissing	64,200
O'Brien	130,750
Tem. and H. B.	66,000
Trethewey	115,080
Watts	61,700

The total shipments for the week were 767,640 pounds, or 483 tons. The total shipments from Januarylst to date, are 4,159,232 pounds, or 2,079 tons. The total shipments for the year 1907, were 28,081,010 pounds, or 14,040 tons.

COBALT ORE SHIPMENTS.

Following are the shipments of orre from the Cobalt camp for the week ending February 8th:—

	Pounds
Drummond	52,340
King Edward	62,370
La Rose	42,452
O'Brien	191,000
Temiskaming	66,000
Watts	61,700

The total shipments for the week were 539,842 pounds, or 269 tons. The total shipments from January 1st, are 3,191,592 pounds, or 1,595 tons.

The London Statist calculates the world's output of gold in 1907, as £82,205,000, or $411,025,000, against £82,482,00 in 1906, or $412,410,000, divided as follows:—

	1907.	1906
Transvaal	£27,406,000	£24,585,000
Rhodesia	2,218,000	2,000,000
West Africa	1,160,000	877,000
Australia	15,539,000	16,929,000
India	2,559,000	2,261,000
Canada	2,000,000	2,300,000
United States	17,923,000	18,875,000
Other countries	13,400,000	14,300,000
Total	£82,205,000	£82,482,000

World's production in 1905, was £75,427,000; 1904, £69,378,000; 1903, £65,192,00; 1902, £59,348,000; 1901, £52,198,000; 1900, £50,915,000; 1895, £39,752,00; 1890, £24,260,000; 1885, £22,750,000; 1870, £21,370,000.

Following are the weekly shipments from Cobalt camp, and those from January 1st, to date.

	Week end Feb. 22. Ore in lbs	Since Jan. 1. Ore in lbs
Buffalo	.....	237,500
Coniagas	.....	198,930
Cobalt Lake	.....	50,800
City Cobalt	42,960	42,960
Drummond	.....	92,340
Foster	.....	168,600
Kerr Lake	.....	82,590
King Edward	.....	127,240
La Rose	.....	237,842
McKinley	.....	506,420
Nipissing	.....	437,700
Nova Scotia	.....	40,790
O'Brien	129,860	828,240
Standard	.....	29,730
Silver Queen	.....	243,000
Silver Cliff	.....	52,000
Silver Leaf	.....	62,000
Townsite	.....	45,000
Temiskaming	56,250	115,650
Temiskaming & H. B.	126,000	258,000
Trethewey	.....	115,000
Watts	.....	61,700

The total shipments for the week were 355,070 pounds, or 177 tons. The total shipments from January 1st, to date, are 4,514,302 pounds, or 2,257 tons. The total shipments for the year 1907, were 28,081,010 pounds, or 14,040 tons. In 1894 the camp produced 158 tons, valued at $136,217; in 1905, 2,144 tons, valued at $1,473,196; in 1906, 5,129 tons, valued at $3,900,000. The estimated value of the ore shipments for 1907, is between $10,000,000 and $12,000,000.

Following are the coal shipments of the Nova Scotia Steel & Coal Company, for January:—

January, 1908	47,750
January, 1907	38,729
Increase, 1908	8,021

The following are the lead receipts at the Consolidated Mining & Smelting Company's plant, at Trail, for the month of January last. The figures given are in pounds:—

Arlington, Erie	13,219
Arlington, Slocan	[illegible]
Bluebird, Sandon	[illegible]
Bluebird, Rossland	2,742
Canadian Group	11,817
Emerald	68,429

The Nova Scotia Steel & Coal Company reports for the year ended December 31, as compared with former years:—

	1907	1906.	1905.
Gross profits	$ 944,791	$ 960,281	$559,966
Intest on bonds	260,885	255,038	248,177
Balance	$ 677,906	$ 704,643	$311,729
Deprec. sinking fund, etc.	274,428	236,783	129,753
Net profit	$ 406,478	$ 467,830	$181,976
Pref. div.	82,400	82,400	82,400
Balance	$ 321,078	$ 385,460	$ 90,576
Com. div.	299,256	.....	.....
Sur. for year	$ 21,822	$ 385,400	$ 99,576
Prev. sur.	1,180,785	795,325	.....
Total surplus	$1,202,607	$1,180,785	.....

A despatch from Sydney, Australia, says that the gold yield of New South Wales, for January, amounted to 29,361 ounces, valued at £110,583, compared with 37,584 ounces, valued at £126,750, same month last year.

The British Columbia Copper Company has issued a statement for the year ending November 30th, 1907. The profit and loss account is as follows:—

Credits:

Balance December 1st, 1906,	$231,022
Premium on stock sales	57,116
Adjustment account	21,724
Income for year ended November 30, 1907,	88,155
Total	$398,018
Expenses	20,777
Net	$377,241
Dividends	201,200
Surplus	$176,041

PIG IRON PRODUCTION.

Philadelphia.—The American Iron & Steel Association has received from the manufacturers complete statistics of the production of all kinds of pig iron in the United States and Canada, in 1907. The total production in the United States was 25,781,361 tons, against 25,307,191 tons in 1906. In Canada the total production in 1907 amounted to 581,146 tons, against 541,957 in 1906.

The world's gold production for 1907, in contrast with 1906, as estimated by the Statist, shows a decrease of about £200,00 to £300,000. Of a total estimated output of a value of £82,200,000 for 1907, the Transvaal contributed £2,200,000 and Rhodesia £2,200,000 in round figures.

Market Reports.

New York Metal Market, February 24th:—

Pig iron, quiet; northern, $17 to $18.75; southern, $16.25 to $18.25. Copper, quiet, lakek, $12.62 1-2 to $12.87 1-2. Lead, quiet, $3.70 to $3.75. Tin, easy; Straits, $28.50 to $29.10. Plates, easy. Spelter, quiet; domestic, $4.70 to $4.75.

Price changes in metal at New York for the week ending February 15th were as follows:—

	High.	Low.	Close.
Copper, lake	13⅝	13¼	13¼
Copper, elec.	13½	13	13
Copper, casting	13¼	12.80	12.80
Lead, spot	3.70	3.70	3.70
Spelter, spot	4.82½	4.60	4.82½

The week's metal prices at London were as follows:—

	High.	Low.	Close.
Copper, spot	£60 0 0	£58 10 0	£58 10 0
Copper, futures	60 7 6	59 0 0	59 0 0
Lead, spot	14 10 0	14 3 9	14 3 9
Spelter, spot	23 0 0	20 13 0	22 0 0

Silver.—February 6th, 55 3-8 cents; February 7th, 55 7-8 cents; February 8th, 55 1-2 cents; February 10th, 57 5-8 cents; February 11th, 56 3-4 cents; February 13th, 57 1-4 cents; February 14th, 57 cents; February 15th, 55 7-8 cents; February 17th, 56 1-8 cents; February 18th, 56 1-2 cents; February 19th, 56 1-4 cents.

The Barret Manufacturing Company takes elaborate pains to supply every inquirer with a free sample of Amatite roofing in order to show what the famous mineral surface is like. This real mineral surface is firmly embedded into the top surface of the roofing and is, of course, practically indestructible by wind or weather, and can be exposed to the elements without fear of damage. Paint or coating is not needed for Amatite, and the manufacturers do not manufacture anything in the way of paint for use upon it. An Amatite roof, once laid in position upon a shaft house will stay there indefinitely without further care or attention of any kind. This is a vast improvement over the roofings which require a new coat of paint every two or three years; and if Amatite cost more than the other roofings it would still be worth while for this reason alone. Amatite, however, does not, in fact, cost as much as other roofings, and farmers who are preparing to roof any of their buildings should investigate it. The Barrett Manufacturing Company, New York, Chicago, Philadelphia, St. Louis, Cleveland, Allegheny, Cincinnati, Kansas City, Minneapolis, New Orleans, Boston, will send a sample on request.

MINERALS And How They Occur

A Book for Secondary Schools and Prospectors

BY

WILLET G. MILLER

Provincial Geologist of Ontario; formerly Professor of Geology in the School of Mining, Queen's University, Kingston, Canada

252 pages; price $1.00; post paid. Boards

Dr. Miller's text-book, now in its third edition, has undoubtedly met the requirements of prospectors and students. It is simple in diction, and logical in plan. It comprises exactly the information needed by the beginner and, because of its clearness and simplicity, it is distinctly of value to all classes of mining men.

"Minerals and How They Occur" can be obtained from the Canadian Mining Journal

ROOFS
That Stay Roofed

The strongest wind that ever blew can't rip away a roof covered with self-locking

"OSHAWA"
GALVANIZED
STEEL SHINGLES

Rain can't get through it in 25 years (guaranteed in writing for that long—good for a century, really)—fire can't bother such a roof—proof against all the elements—the cheapest GOOD roof there is.

Write us and we'll show you why it costs least to roof right. Just address

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Mining Company Audits a Specialty.

Wanted--

Position as Mine Manager or Superintendent, by man of 25 years practical experience, have handled gold, silver, lead and copper properties. Capable of handling any mining proposition. Strictly honest and sober. Address—

Superintendent, Box 435, Rossland, B.C.

COAL MINING

A gentleman with considerable experience in both flat and pitching veins, and handling of large numbers of men; also holding first-class English and British Columbia, also Alberta Certificates, seeks situation as general Manager or superintendent. Highest references from present employers.

Apply, ENERGETIC, CANADIAN MINING JOURNAL.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class	**$80.00 to $500.00**
2nd "	**45.00 and 47.50**
3rd "	**28.75**

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch. If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers, kindly mention this Journal.

Dominion of Canada

Synopsis of Canadian North-West Mining Regulations

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

N.B.—Unauthorized publication of this advertisement will not be paid for.

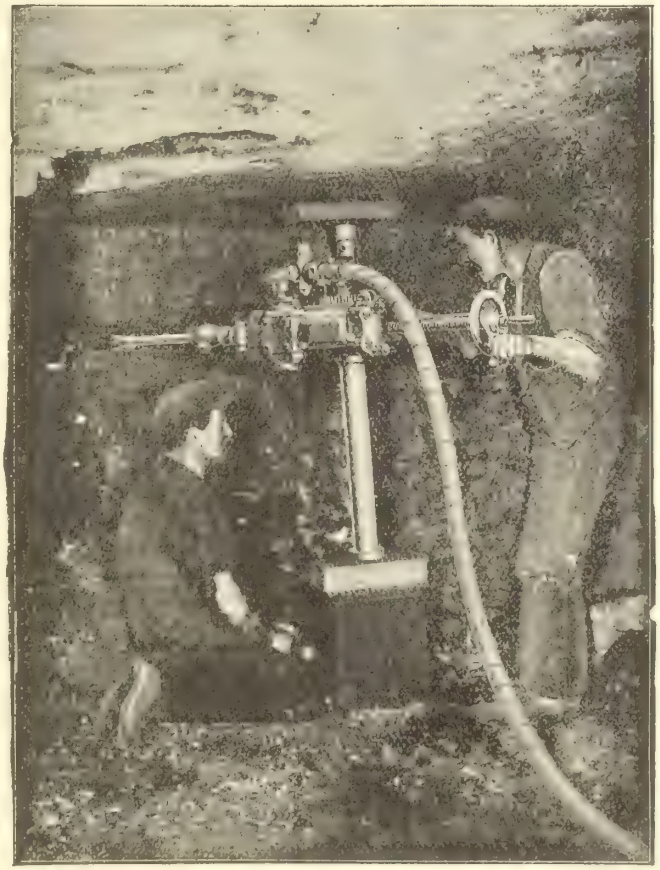
A Useful Catalogue

HAVE you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our New Spring Catalogue will be ready for mailing March 1. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. The new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of advantageous information for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.



It will include "Specials" for mining men, prospectors, and all who have heavy work to do or rough journeys to make.

Sullivan Hammer Drills

FOR OVERHEAD MINING WORK

The Sullivan "Class D-21" Hammer Drill is the most economical means yet devised for breaking ground in raises and overhead stopes.

Fifty-three cents per ton is one record, made with this drill, in a six-foot Cripple Creek stope.

Numerous tests in the principal mining districts of the United States and Mexico have shown the Sullivan "D-21" to be faster and more economical of power and repairs, in this class of work, than any other rock drill, of either the air hammer or piston type.

The characteristics of this drill, and its recent work in western mining camps, are described in a special article in "Mine and Quarry." Ask for the February issue.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

R. G. DRINNEN, Superintendent.
G. G. S. LINDSEY, General Manager.

OFF FOR THE COAST

"See Canada First"

Go yourself this summer, see with your own eyes the wonderland of Western Canada. Wide sweeps of prairie, following the timber country, and followed by the finest mountain scenery in the world, ranges of peaks thousands of feet high, all can be

seen at ease from the trains of the

CANADIAN PACIFIC RAILWAY

No more delightful vacation trip imaginable. Not an expensive trip, summer tourist rates and occasional excursion rates considerably reduce the cost.

Let us help you plan your tour, so you will miss nothing. It will be a pleasure to answer enquiries.

CANADIAN MINING INSTITUTE.

In many senses the recent annual meeting of the Canadian Mining Institute was unique. In respect of attendance it established, we believe, a new record. British Columbia, Ontario and Quebec were heavily represented, although Nova Scotia sent but one or two members.

The vote registered was large, larger in fact than on any previous occasion. The papers were of wide range, were well presented and intelligently discussed. The introduction of the plan of presenting a brief verbal outline of each paper instead of reading it in its entirety is to be commended.

The arrangements in nearly every particular went much more smoothly than is usual. The business meetings, at which much spirit, but little acrimony, was manifested, were well conducted. The smoker and the dinner were heartily enjoyed. In fine, the whole session was on of good-fellowship and harmony.

To the success of this Tenth Annual Meeting there were at least three contributory causes—the Ottawa committee, which spared no pains to perfect every detail in the scheme of entertainment; the Secretary of the Institute; and THE CANADIAN MINING JOURNAL. We modestly place ourselves in this category of moving causes for the reason that we believe our efforts responsible for awakening the paid officials of the Institute to the necessity of bestirring themselves. To use a homespun metaphor, we were as turpentine upon drowsing steeds.

The faithfulness of the chairman, Past President Frederick Keffer, who attended the meeting at great inconvenience, should be inspiring to officers and members alike.

THE SOUTH AFRICAN MINING JOURNAL.

Our enterprising contemporary, *South African Mines, Commerce and Industries,* has decided to shorten its title to *South African Mining Journal.* There is no question as to the wisdom and expediency of this decision. The former name is cumbersome. The latter is succinct.

South African mining men are under a heavy obligation to their leading mining journal for its recent successful organizing of a series of air drill contests. Under its new name we wish the *South African Mining Journal* enlarged usefulness and continued prosperity.

TWO ESTIMATES.

In the *Mining World* of March 7th Mr. F. C. Nicholas takes exception to a polite request in a previous number of The Canadian Mining Journal for more information as to the way in which he obtained his valuation of the property and stock of the Bonanza Creek Gold Mining Company, Limited. As he accuses us of making "distorted quotations" from his article, we shall here quote from it verbatim.

"The gravel which can be worked is estimated at 30,000,000 superficial feet, and an average of 60 feet, with values in all of it placed at about $3 per foot, measured from a superficial foot to bed rock 60 feet below the surface. At this estimates there is nearly $90,000,000 gross in the property, equivalent to $257 gross for each of the 350,000 shares of the company's stock. Operating expenses are estimated at 60 to 90 cents per superficial foot to bed rock, with 20 per cent. added for contingent expenses, resulting in a prospective return of $164.56 net for each share. It is expected that it will take 30 to 40 years to work out the property, and at this rate the return expected is $4.11, or about 80 per cent. annually on the stock. The maximum expectation is rarely attained in any mine, and often years are required to develop full efficiency. Taking the risk at Bonanza Creek as 25 per cent. assured, there will be 20 per cent. annually for the stock, with prospects for even better returns."

With regard to this Mr. Nicholas says in his reply to our enquiry, "As to the data on which the article was was based I took them from reports made by members of my field staff who were with me last fall, but have now returned to Alaska, to be gone some time. In addition to these data I had information from parties interested in the property and from other engineers. From such information the article was written, and I am free to say that I endorse the reports made by the members of my staff with entire confidence.

"As to my estimates of share values to which The Canadian Mining Journal refers, the results are arrived at by careful investigations, such as I am constantly making for clients interested in mining securities. Naturally, my estimates of values are made by my own methods and on my own responsibility; and I am happy to say that a number of clients and others hold them in high esteem."

In order better to correlate this estimate with the estimate made by Mr. R. G. McConnell, of the Geological Survey of Canada, it is convenient to reduce the figures of quantity to cubic yards. Thus the amount of gravel here represented would therefore be roughly 66,000,000 cubic yards.

The property of the Bonanza Creek Gold Mining Company, Limited, appears to be located somewhere on the white gravel of the west side of the valley of Bonanza Creek, below the mouth of Adams gulch. But as there are also several other properties on the same side of the valley, this property does not cover the whole of the white gravel.

Mr. McConnell writes of this as follows:—

"The volumes of gravel on the Upper Bonanza and Eldorado hills are as follows:—

	Cubic yards.
Bunker Hill	1,050,000
French Hill	1,670,360
Gold Hill	3,684,940
Chechaco Hill	5,805,236
Adams Hill	7,561,370
Magnet Hill	485,672
American Hill	2,210,888
Orofino Hill	6,892,130
Monte Cristo Hill	3,710,490
King Solomon Hill	10,780,587
Boulder Hill	1,475,216
	45,326,889

Subtracting the quantity here stated as from Bunker Hill to Chechaco Hill, which are certainly higher up the valley of Bonanza Creek than the property of the Bonanza Creek Gold Mining Company, there remains, according to Mr. McConnell's determination a total of 33,116,352 cubic yards, only part of which is included in the property under consideration.

Continuing, Mr. McConnell writes:—

"A paystreak varying from 200 to over 400 feet in width has been traced trhough all these hills. It is partly destroyed in places, but on some of the hills, notably on Orofino and Monte Cristo, it is situated some distance back from the present secondary valley, and is entirely preserved.

"The paystreak is now practically drifted out, portions of it twice over, and is estimated to have yielded gold to the value of $24,000,000.

"Drifting operations, however, never result in a full extraction of the gold. A few pillars and occasional small areas are usually neglected for various causes; the bed rock is seldom thoroughly mined, and no attempt is, of course, made to recover the values in the upper lean gravels. The paystreak gravels are also bordered as a rule on both sides by considerable fringes of gravel, too lean to drift but rich enough in most cases to hydraulick.

"The gravels in the Upper Bonanza hills, considered rich enough to be hydraulicked at a profit, include all those in the original paystreak, those in a band behind the paystreak varying in width on the different hills from 100 to 200 feet, and those between the paystreak and the present valley.

"The gravels in the back portion of most of the hills are too lean to be worked by any method.

"The volumes of workable gravels on the various hills are estimated as follows:—

	Cubic yards.
Bunker	850,000
French	570,360
Gold	1,779,650
Chechaco	3,752,914
Adams	2,379,000
Magnet	395,677
American	1,989,218
Orofino	5,533,000
Monte Cristo	1,853,150
King Solomon	4,681,087
Boulder	332,000
	24,116,056

"The average values in these gravels are estimated at 34.05 cents per cubic yard and the amount of recoverable gold at $8,213,532."

Deducting as before the quantity of gravel on the hills from Bunker Hill to Chechaco Hill, there remains a total of 17,163,132 cubic yards as the total volume of the workable white gravel on the west side of Bonanza Creek. At Mr. McConnell's valuation of 34.05 cents per cubic yard, these have a total value of $5,844,046.

Mr. Nicholas says: "I wish to avoid a controversy in this matter." But a request for an explanation of the difference in his gross valuation of $90,000,000 for one property and $5,844,046 for it and several other properties together, previously made by an accredited official of the Canadian Government, is deserving of fuller consideration than he has seen fit to give it.

SAFETY LAMPS.

The evidence being gathered by the English Royal Commission on Safety in Mines, among other recommendations makes several bearing upon the use of safety lamps. One important witness urges that the screw-locked lamps be entirely done away with and that safety lamps be standardized as nearly as possible. In all fiery mines the use and distributed quantities of explosives should be strictly controlled, as also the kind of explosive.

THE TENTH ANNUAL MEETING OF THE CANADIAN MINING INSTITUTE.

WEDNESDAY'S SESSION.

With every augury of success and with an exceptionally full registration of members, the Canadian Mining Institute opened its Tenth Annual Meeting at the Russell House, Ottawa, on the morning of Wednesday, March 4th. President Frederick Keffer, of Greenwood, B.C., presided. The attendance from Ontario, Quebec and British Columbia was more than usually heavy. Nova Scotia had but few representatives.

The Hon. William Templeman opened the first session on Wednesday morning with an address in which he dwelt appreciatively upon the work of the Institute and gave warm assurances of the support of the Department of Mines.

The following papers were read and discussed: "The Classification of Coal," by D. B. Dowling, Ottawa; "The Carbon Minerals of New Brunswick," Dr. R. W. Ells, Ottawa; "Secondary Mining Education," H. H. Stoek, editor of *Mines and Minerals*, Scranton, Pa.; and "Compilation of Mining Statistics," J. McLeish, Ottawa.

The paper read by Mr. D. B. Dowling on "The Classification of Coals" gave rise to much discussion, the result of which was that the President was requested to appoint a committee of five to investigate and report upon the laboratory methods of coal analysis. Dr. Ells' and Mr. McLeish's papers were also sources of profitable argument. After the methods of compiling mineral statistics in vogue in Ontario, Quebec and British Columbia had been taken up by Messrs. T. W. Gibson, J. Obalski and Dr. J. E. Woodman, it was resolved to request the Dominion Government to take the steps necessary to calling together representatives from each of the Provincial Governments for the purpose of comparing and unifying the various divergent methods now in use. The afternoon and evening were also filled out with the reading and discussion of papers. The evening papers were illustrated by lantern slides. The slides prepared and used by Mr. D. B. Dowling in his paper on "Yellowhead Pass" were the subject of much favorable comment. Mr. E. D. Ingalls' paper on a "System of Conventional Signs for Showing Mineral Occurrences on Mapes, etc.," also illustrated by slides, was original and ingenious.

THURSDAY'S SESSIONS.

The President's annual address included mention of the approaching visit of the British Iron and Steel Institute, to the increase in membership from 500 to 700 members during the year, and to the proposed establishment of technical libraries in mining centres.

The Treasurer's report, presented by Mr. J. Stevenson Brown, Montreal, showed the gross receipts for the year, including a balance of $1,354 from 1906, of $11,396. The disbursements amounted to $7,923, leaving a balance on hand of $3,472. The receipts included a Dominion Government grant of $3,000, a Provincial grant of $1,500, and membership fees, $4,362.

After debate it was decided to change the form of the Treasurer's report so as to make it more specific and detailed.

The report of the Secretary, Mr. H. Mortimer Lamb, referred to the establishment of three branches of the Institute: Western men at Nelson, with Mr. A. B. W. Hodges, Grand Forks, as President, and Mr. E. Jacobs, Victoria, Secretary; Cobalt Institute, Mr. A. A. Cole,

President and Mr. G. R. Harty, Secretary; and the Eastern Branch, at Montreal, with Mr. George E. Drummond as President and Mr. J. W. Bell as Secretary. Appreciation was expressed at the formation of the Federal Department of Mines and the increase of the Federal Government grant to the Institute from $3,000 to $5,000. Mr. Lamb reported that Mr. Frank E. Lathe, of McGill University had been awarded the President's gold medal for the best paper by a student member.

In the afternoon more papers were read. The evening was taken up with a thoroughly enjoyable smoker, arranged by the members of the Ottawa committee. The outstanding feature of the evening was the monologue given by Mr. Gordon Rogers and entitled "Mr. Dooley on Mining." Mr. Dooley's experience in the profession extended from buying "gumdrop" stock to sending a four-pound package of manuscript to THE CANADIAN MINING JOURNAL and having it returned collect.

FRIDAY'S SESSIONS.

The ballot box had closed at 6 p.m. on Thursday and results were expected early Friday morning. This, however, was not to be. The large number of nominations and the ingenious complexity of the ballot form made the work of the scrutineers, Messrs. Brock, Wilson and Hobart, excessively tiresome.

Dr. Willett G. Miller, President C.M.I.

On Friday morning the Institute unanimously placed itself on record as in favour of the renewal of the Dominion lead bounty. In discussing the motion, it was pointed out by Mr. J. C. Murray, editor of THE CANADIAN MINING JOURNAL, that the British Columbia Provincial coal tax, recently imposed upon the coal and coke of British Columbia, had a vital bearing upon the lead bounty. The tax itself would fall ultimately upon the metalliferous mines and would, in a sense, tend to neutralize the bounty. Hence both questions should be considered together.

The motion regarding the bounty was worded thus:—

"That this meeting, in continuation of the policy in the past, endorse the request of the lead miners and smelters of British Columbia, now before the Government, for an extension of the lead bounty act for a further period of five years, with an increase in the minimum price of lead fixed by the bounty from $80 to $90 per 2,240 pounds."

The President is to appoint a committee to lay the matter before the Minister of Trade and Commerce.

Among other business transacted on Friday was the passage of the motion of Dr. A. E. Barlow, that a vote be taken by letter ballot on the proposed removal of the headquarters of the Institute from Montreal to Ottawa. Mr. John E. Hardman and Dr. Barlow were appointed a committee to write a circular explaining the reasons for and against the proposed change.

On motion of Mr. J. B. Tyrrell, seconded by Dr. T. L. Walker, it was decided to request the railways to grant reduced rates to prospectors. Prospectors were defined as the holders of mining licenses.

The reading of technical papers concluded the afternoon's work.

About six o'clock the results of the elections were announced as follows:—

President—Dr. W. G. Miller, Toronto.

Vice-Presidents—Mr. G. E. Drummond, Montreal; Mr. W. Fleet Robertson, Victoria, B.C.; Dr. A.E. Barlow.

Secretary—Mr. H. Mortimer-Lamb, Montreal.

Treasurer—Mr. J. Stevenson Brown, Montreal.

Councillors—Mr. W. M. Brewer, Victoria, B.C.; Mr. Arthur A. Cole, Cobalt, Ont.; Mr. D. H. Drury, Montreal, Que.; Mr. Chas. Fergie, Glace Bay, N.S.; Mr. J. E. Hardman, Montreal, Que.; Mr. R. T. Hopper, Montreal, Que.; Mr. A. J. McNab, Trail, B.C.; Mr. W. F. C. Parsons, Londonderry, N.S.; Mr. D. W. Robb, Amherst, N.S.; Mr. O. B. Smith, Phoenix, B.C.; Mr. R. H. Stewart, Rossland, B.C.; Mr. J. B. Tyrrell, Toronto, Ont.

The Annual Dinner, on Friday evening, concluded the best convention that the Institute has ever held.

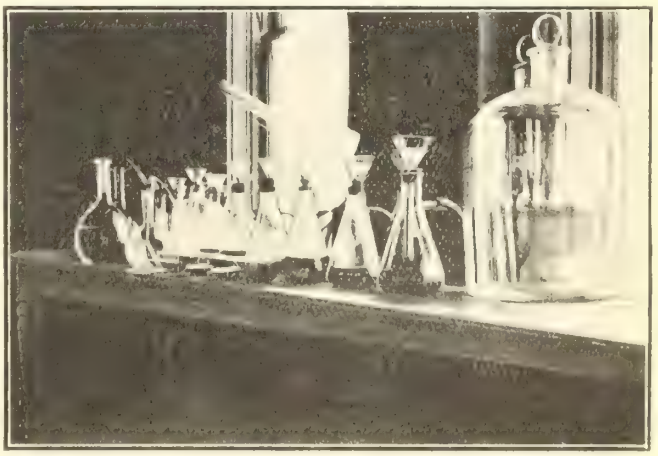
Mining Science, February 20th.—Continuing his articles on slime concentration practice, Edwin A. Sperry writes of dewatering in this issue of *Mining Science.* Since there is mechanical loss wherever there is a current, Mr. Sperry believes that the use of canvas strakes, or "rag plants" are not as economical as settling tanks for dewatering. Two instances are cited. In one mill 180 tons of ore was crushed. The mill tails were screened on 20 mesh shaking screens. The undersize went to settling tanks, the overflow from which was 60 mesh and finer. This product amounted to 65 tons in 24 hours, carrying 4.7 per cent. of lead. 13.16 tons was caught in canvas and 51.84 tons wasted as tails. 48.4 per cent. of the total lead was wasted with the tails. 90.7 per cent. of the total lead would pass 200 mesh screen and, taking the retreatment of the canvas plant heads as a criterion, 80 per cent. of this could have been saved by dewatering and slime table treatment.

Other good points are made in the article. The conical Callow tank, 7 feet 7 inches high, with an effective width at the top of 8 feet, has a settling capacity of 20 gallons per minute in volume. The capacity for solid material depends, of course, upon the consistence of the pulp. With 10 per cent. solids 20 to 25 tons per 24 hours should be handled.

The liability of choking taking place at the apex of conical settling tanks is met by attracting an auxiliary chamber to the side of the tank in the form of a long tube having an opening into the tank for almost its entire length. The lower end is closed. At the upper end is a gland through which is inserted a pipe, the lower end of which reaches nearly to the lower end of the auxiliary chamber. This pipe is used as the draw off. It can be so manipulated as to remove clogging.

A CANADIAN METHOD FOR THE TECHNICAL DETERMINATION OF SILICON IN PIG IRON.

By Randolph Bolling.



Chemist, Nova Scotia Steel & Coal Company, Sydney Mines, N.S.

The writer contributes this article for the analytical readers and for the practical works chemist who is often required to perform much and to whom time is a necessary consideration.

On reading the interesting article in The Journal of January 15th on pig iron analysis, I was struck with the fact that the directions for the determination of silicon as given by the American Foundryman's Association could not be used in ordinary routine analysis at blast furnaces, except at great expense of time. A modern furnace makes from six to eight casts per day, and half of these are made during the night. The chemist usually finds three or four samples awaiting ananlysis in the morning, so that orders calling for certain grades of iron may be filled immediately, without rehandling. If one follows the foundryman's method (the American system), the hydrofluoric acid treatment of the residue would consume at least an hour beyond the actual time required for the other chemical reactions to separate silica from pig iron. The hydrofluoric treatment of the residue, in order to volatilize all of the silica, would appear necessary from a theoretical standpoint, as the argument could be advanced that the residue left after the solution, dehydration, and combustion would be contaminated with other substances than silica. Practical experiments by the writer extending over ten years on pig iron made in different localities in the United States and Canada show that under certain operating conditions, which I will describe later, not the smallest trace of any element except silicon was found in the residue. It volatilized completely when moistened with sulphuric acid and heated with a few cubic centimeters of hydrofluoric acid. The importance of this statement can be appreciated when it is recalled that silicon is the expensive constituent in pig iron. The difference of only one per cent. of this element in pig iron means a variation of from $3 to $4 per ton to the blast furnace. For instance, No. 4 usually contains from 0.85 to 1.20 per cent. silicon, No. 1 iron contains from 2.70 to 3.50 per cent. When iron is sold strictly on analysis No. 1 iron will always command from $3 to $4 higher per ton than No. 4. You may ask, why do the market prices of grades vary? The answer is simple—coke. In order that a blast furnace may produce No. 1 or comparatively speaking high silicon iron, the furnace manager is compelled in blast furnace parlance "to lighten the burden." This means that if he is running on basic, or No. 4, iron, with a certain ratio of coke to limestone and ore, he must reduce the weight of ore and limestone, *i.e.*, increase the ratio of coke to the rest of the charge in order that a higher temperature may develop in the zone of fusion in the blast furnace, reducing a greater amount of silica in this charge to silicon in the pig iron. and raising the percentage of silicon in the pig metal. The increase being a measure of the fuel used, it follows that the higher the silicon, the higher the cost of the metal producer, because of the increase in the cost of fuel. It thus follows that the accurate determination of the silicon contents of each cast is a matter of prime importance. The method the writer uses is a modification of the one suggested several years ago by Prof. Drown, of the Massachusetts Institute of Technology, which became very popular owing to the simplicity of the operating details and the rapidity and accuracy attained. In fact, its use is almost universal.

Method for Silicon Used in Nova Scotia Steel & Coal Companys' Laboratory.

A representative sample composed of fine drillings having been secured, a triple factor weight 1.4106 grams is carefully weighed on an analytical balance sensible to 1-20 mg. The sample must be picked up with a magnet of the horseshoe type from a sheet of paper in order that no sand from the skin of the sample pig should contaminate the sample when it was being drilled, previous to the weighing operation. This weighed portion is next brushed into a No. 3A Royal Berlin porcelain casserole, or other brand of casserole, which will hold approximately 300 c. cm. up to the spout. A clock glass of about 5 inches in diameter is placed on the casserole. Solution of the metal is now affected on a hot plate,

Heavy Glass Side Tube Erlenmeyer Flask Attached by Hose to Suction.

either electrically heated or by gas burner, by silicon mixture, which is prepared, viz.:

A No. 10 breaker is filled with 1200 c. cm. of distilled water. To this is added one liter of nitric acid, sp. gr. 1.42 C.P., and this mixture stirred with a glass rod. Now add in a very fine stream with vigorous stirring 400 c. cm. of sulphuric acid 1.84 sp. gr. C.P. The operation is best conducted in a sink with six or eight inches of water, as a very great rise in temperature follows the action of the sulphuric acid on aquous solutions. This is the best silicon mixture formula. There is sufficient sulphuric acid to completely dehydrate the silica formed by the oxydizing action of the nitric acid. The triple fact or weight of metal requires 25 c.cm. of this mixture. The casserole is heated on the hot plate, so that a brisk effervescence of nitrous acid (deep brown fumes) proceeds without the contents boiling over. After ten or fifteen minutes solution is affected and is noted by a disappearance of the brown fumes and the solution subsides in the casserole and boils quietly. It is now ready for

an increase in temperature, a blue flame bunsen under a wire gauze is just the requisite heat, and the casserole is transferred from the hot place to the red hot gauze. The solution boils rapidly with a steady jet of steam issuing from the spout, the water is quickly evaporated, and as the last portions are driven out a slight spatter is heard to proceed from the casserole as a bumping action throws a little of the ferric sulphate and silica off the bottom against the glass cover. At this point dense white clouds of sulphuric anhydride are expelled and are quite readily manifested by an irritation of the operator's respiratory passages with a slight cough. This

Electric Hot Plate and Bunsen Burners.

is usually avoided by working under a laboratory fume hood with induced draught. A single drop of strong acid distilled from the residue will condense on the cooler cover and fall back again on the hot bottom of the casserole, with a hissing sound. This is the signal for removing the casserole from the flame and allowing it to cool. The residue is composed of anhydrous ferric sulphate, silica, a little scale sometimes, and iron phosphate, manganese sulphate and graphite. Hot water is now added to the extent of 200 c. cm. and the casserole again boiled. After solution of all soluble salts is observed 50 c. cm. of hydrochloric acid is added and the boiling continued, in order to dissolve all iron compounds, insoluble in hot water, taking care to note if any particles show hydrogen bubbles, a sign that too coarse drillings have been used. If all is dissolved a liter erlenmeyer heavy glass side neck flask, with platinum cone and 3 inch funnel is fitted with a nine centimeter analytical filter paper. The S. & S. brand, black ribbon, is a favorite for this determination. The aspirator is started and the acid solution filtered and transferred by water jet from a washing flask. Some silica and graphite still adhere to the bottom and sides of the casserole. The most effective way to remove this deposit is to carefully cleanse the middle finger and gently rub the interior of the casserole until it appears perfectly white and clean. Rinsing off the tip of the finger with the water jet removes every particle of the adhering silica and graphite. Wash the funnel with hot water until all yellow ferric chloride is removed; then wash once with hydrochloric acid of 1.05 sp. gr. Any ferric salts will betray themselves at this point by a yellow discoloration on the paper or just back of the paper at its juncture with the glass walls of the funnel. Wash until every trace of ferric salts is removed. Remove acid from paper by three systematic hot water washings and allow the paper and residue to remain in the funnel to get rid of as much water as possible. A few minutes' suction does this. Remove filter paper and residue to a small 8 or 10 c.cm. weighed platinum crucible and heat over a small flame until the paper is charred. Now bring the crucible to incandescent heat over an air-gas blow pipe, and at the same time introduce a slow stream of oxygen gas through a tube in order to promote rapid combustion of the graphite. After the glow ceases, continue to heat and stir with a platinum rod until the silica appears white. Cool in a dessicator over dry calcium chloride, weigh, divide the weight of silica found by 3 and multiply by 100. The result is the per cent. of silicon in the sample. Oxygen compressed in steel tanks for calcium light apparatus is the most convenient source of gas and is cheap, its use for this purpose being distinctly novel.

Editor's Note.—Alternate washings with dilute ammonia, hot water, and dilute hydrochloric acid are to be recommended here.

MODES OF OCCURRENCE OF CANADIAN GRAPHITE.*

By H. P. H. Brumell, Buckingham, Que.

(Ottawa Meeting, 1908.)

Outside of those directly interested in the mining or geology of graphite the impression seems to prevail that this mineral invariably occurs in veins or nondescript masses. In view of the fact that all our deposits of permanent value are those of disseminated ore, the writer has undertaken to put together this brief paper on the subject with the hope that those interested in the industry will devote a little more attention to the development of some of our enormous deposits of comparatively low percentage disseminated ore, rather than to the exploitation of the higher percentage, and almost invariably erratic, deposits of so-called "pure lump."

The only ore under consideration in this paper is that found in the Archæan rocks from which, solely, do we obtain any of the crystalline or flake variety, and the area covered will be that in which so much work has been done in the counties of Labelle and Argenteuil, in the Province of Quebec. In the former county the graphite is found most prominently in a more or less wide band of gneiss appearing near the front of the township of Templeton, whence it extends in a northeasterly direction into the township of Buckingham between the fourth and tenth ranges across which it sweeps, in a general easterly direction, into the township of Lochaber, where it turns again to the northeast, and so passes into the township of Mulgrave. In the county of Argenteuil the graphite occurs, almost invariably, in the limestones which are very strongly developed in the township of Grenville and these town-

*Journal of the Canadian Mining Institute. Part of Vol. XI.

ships to the north. These bands of limestone are bounded by large porphyry and syenite mass to the east, and by the granites of the Rouge River to the west. It will thus be seen that in these two countries the mineral occurs in two very distinctly different rocks. Not only do the rocks differ, but the ore also, that of Labelle county being mainly a disseminated ore, while that of Argenteuil occurs in veins and segregated masses; although the limestones, in the vicinity of these deposits, are often impregnated with disseminated scales of graphite to a considerable distance from the ore body.

To treat the subject in a broad sense and for convenience in this paper, the modes of occurrence may be briefly summarized as follows:—

1st. As disseminated ore, where the graphite occurs in small, bright, scaly crypto-crystalline particles, in a grey or red weathering gneiss, the particles lying parallel to the apparent stratification, or in larger similar particles in quartzite or coarse grained granite.

2nd. In the form of true fissure veins, usually cutting diorite or other eruptives.

3rd. As veins or irregular masses and contact reposits in limestone.

Of these three very distinct modes of occurrence the most important is, beyond all doubt, the first. These gneisses are very distinctly foliated and consist essentially of quartz and orthoclase with sillimanite, hornblende, pyroxene and pyrite, the latter mineral on weathering giving a reddish rusty appearance to the rocks. Interstratified with the gneisses are bands of crystalline limestone, frequently lenticular and not usually of great thickness. Dr. R. W. Ells—"Bulletin on Graphite"—says of the disseminated ores of Labelle county:—"The occurrence and association of the mineral are to a large extent the same at most of the places indicated. Certain local conditions are found here and there which must be considered in any mining scheme proposed, but generally it may be said that the chief attention as regards future developments must be made in connection with large bodies of the disseminated flake graphite, as promising the most steadfast returns. Though the vein form frequently occurs at most of the points where attempts to work the graphite have been made, and has shown in such cases a mineral of great purity, the uncertainty of such deposits is such that, by itself, the employment of capital on a large scale would scarcely be warranted. . . .

"The most persistent of the graphite deposits, however, are those which are found as disseminated flake. In the Buckingham district, this variety is found usually in the grey mica gneiss in bands or beds, which sometimes have a thickness of from ten to fifteen feet, or in places even more, as well as in limestone. In some of these beds the graphite is very thickly distributed, and the rock is quite black from its presence, indicating a high percentage of the mineral. Several assays were made by Dr. Hoffmann in the Survey laboratory, some years ago, which were published in the report for 1876-77, and are as follows:—

'A specimen of disseminated ore from lot 28, range VI, Buckingham, owned by the Montreal Plumbago Company, the sample being regarded as a fair average of one of the largest and most extensively worked beds in the area, with a breadth of eight feet, gave by assay, graphite, 27.518; rock matter, 72.438 per cent. A sample from lot 22, range VI, Buckingham Mining Company, gave graphite, 22.385; rock matter, 75.875 per cent. Specimens from lot 20, range VIII, gave graphite, 23.798; rock matter, 75.026 per cent.; and from lot 23, range VI, graphite 30.516; rock matter, 69.349 per cent. In all the above occurrences the amount of disseminated ore seems to be large, and in some the presence of the vein variety is also recognized.

'It must not be supposed that all the disseminated ore occurs in beds as rich as those just mentioned, but at very many points deposits exist which give amounts of flake from large bodies of ore, which range from 10 to 15 per cent. or even higher.' "

The foregoing is a very terse and accurate statement of facts, and it is to ores of this description that the energies of those at present engaged in the business are being bent. Already several extensive and characteristic deposits have been developed, notably those of the late North American Graphite Company, the Buckingham Graphite Company and the Bell Mines, all in Buckingham township, on whose properties are one or more extensive beds of graphite gneiss, assaying from 20 to 30 per cent. of graphitic carbon.

A very noticeable characteristic of most of the beds in the district is found at or near their contact with any of the later eruptives, where there is usually a very pronounced enrichment in graphite. This phase of the subject, however, need not be dwelt upon here.

Regarding the second or vein form of occurrence, but little need be said except that the deposits are true fisure veins, usually, in Labelle county, in diorite, at times continuing into the gneiss; in rare instances these veins have been noted in granite, pegmatite, pyroxenite and felsite. The graphite, which is of exceptional purity, occurs in fibrous and foliated forms, the fibres and plates lying at right angles to the enclosing walls, though in some rare instances the fibres and plates occur almost parallel to the walls and have the appearance of having drawn out by some dynamic action. In the latter instance the ore is usually harsh and lack—lustre. In one of the many veins opened on Lake Terror, where the ore occurs in a felsite, a vein of fibrous graphite about two inches in width gave every evidence of intense lateral pressure, the fibres being bent at the centre forming an angle of about 60 degrees without breaking the fibre. Of the purity of the vein graphite of Labelle county, the following assays by G. C. Hoffmann bear ample testimony.

"Vein graphite, foliated.—From a vein running through lots twenty-one and twenty-two of the seventh range of Buckingham. The structure of this graphite was massive, dense, made up of broad and thick laminæ. Color dark steel grey. Lustre metallic. Specific gravity 2.2689, (containing 0.147 per cent. ash). Its composition was found to be as follows:—

Carbon	99.675
Ash	0.147
Volatile matter	0.178
	100.000

"Vein graphite, columnar.—From the twenty-seventh lot of the sixth range of Buckingham. Structure of the graphite, compact, columnar; the columnar structure is usually erect, and at right angles to the surface upon which it occurs; in some instances, however, it is curved as though from pressure. The graphite breaks readily in the direction of the structure into more or less angular aggregates, each aggregate being made up of thin, narrow folia of very uniform width. The length of the columns varied in different specimens from about one

and a half to eight centimetres. In this specimen the foreign mineral matter was very evenly distributed through the structure of, and as a film upon, the graphite, so that on incineration the residual ash formed a tolerably perfect cast of the fragment employed. Color of untarnished foliae, dark steel grey. Lustre metallic. Specific gravity 2.2679 (containing 1.780 per cent. ash). Its composition was found to be as follows:—

Carbon	97.626
Ash	1.780
Volatile matter	0.594
	100.000

Economically this form of graphite has not proved itself of value. The veins are small and very irregular, in no instance exhibiting any appreciable degree of persistence as to size, veins which, on discovery, appeared to warrant systematic operations, invariably pinching out or running off into numerous small pockets and stringers. Many attempts have been made to operate these deposits, but in no instance, within the knowledge of the writer, has the venture proved profitable.

In treating of the third mode of occurrence, that of deposits in crystalline limestone, as illustrated by all of those of Argenteuil county, it is, by reason of the small amount of development work done, extremely difficult to accurately describe the ore bodies. Scattered through the limestone are numerous irregular masses of a very pure foliated graphite, at times having all the appearance of true veins, though more frequently appearing as contact deposits in the neighborhood of small eruptive masses and dykes which cut the limestone at many points.

In writing of the property of the National Graphite Company, lot 9, range V, Grenville township, Dr. R. W. Ells describes a typical deposit as follows:—

"The country rock is for the most part crystalline limestone, which is cut by granite and other instrusives. The graphite usually occurs irregularly at, or near, the contact of the limestone with granite or diabase dykes, both rocks being present in the openings, also in irregular vein forms, which are massive rather than columnar in character, ranging in thickness from fifteen inches to two feet. These are not solid, but apparently sometimes in dyke matter.

"Several openings have been made on the property. In the main pit the rocks are limestone with bands of rusty gneiss, which are traveresed by a white granite dyke and this in turn by a dyke of light green diabase. The graphite occurs principally in two irregular veins, and also in the granite mass, and these is a small vein on the edge of the diabase. The veins are shattered and mixed with a whitish, sometimes reddish, granite.

"The granitic looking rock has somewhat the aspect of a vein in some respects rather than a true dyke. It carries several minerals including scapolite, hornblende, graphite, pyroxene, pyrite, apatite and others. South of the principal opening, where mining has been carried on, the surface rocks for some distance appear to be all limestone, and in several small prospecting pits, sunk in this rock, a small percentage of disseminated flake graphite was observed."

The ore of Argenteuil county is of a very high degree of purity as is evidenced by the following assays by G. C. Hoffmann:—

"Vein graphite, foliated.—From the north half of the third lot of the second range of the Augmentation of Grenville. An exposure here was at one time mined to a small extent. At the opening of the excavation it showed a thickness of about ten inches, but the pure graphite was found to form a lenticular mass, which appeared to be separated from other masses of the same character by intervals, in which the graphite became intermixed with the limestone. Structure massive, dense, made up of broad and thick laminæ, closely interlocking each other at diverging angles, thus presenting a radiated arrangement, the sides of the vein forming the basal line. Color, dark steel grey. Lustre metallic. Specific gravity 2.2714 (containing 0.076 per cent. ash). Its composition was found to be as follows:—

Carbon	99.815
Ash	0.076
Volatile matter	0.109
	100.000

The graphite, as well as occuring in veins and contact deposits of various forms, is found at times in the limestone in the shape of almost perfect spheres, concretionary in form, the plates of fibres of graphite radiating from a centre consisting of a small particle of quartz or other foreign mineral. These concretionary spheres range in size from about one-tenth of an inch to two inches in diameter, and do not appear to follow any apparent bedding of the limestone, but to be scattered irregularly therein.

In summing up the three modes of occurrence it is not thought necessary to draw attention to specific failures to operate profitably the last two classes of deposits, but it may be said, in a general way, that, without exception, no deposit of vein or "pure lump" graphite has been found, on development, to be worthy of consideration as a commercial venture.

This conclusion was foreshadowed by Sir W. E. Logan who, in 1866, concluded his report to the Geological Survey by saying:—"The veins of this mineral hitherto found in the rocks of this country, although affording a very pure material, appear to be too limited and too irregular to be exclusively relied on for mining purposes, which should rather be directed to making available the large quantities of graphite, which, as we have seen, are disseminated in certain beds."

The *Iron and Coal Trades Review*, February 28th.—In an editorial on the eight hours question, the *Review* demonstrates that there is no reasonable analogy between the miners' eight hour bill and other measures designed to promote the welfare of miners. As to the certain effects of this bill it is shown that, whilst safety will not be increased, output will be lessened and the enhanced cost of production will react very strongly upon the market price. Moreover, many mines now working thin seams will be unable to face competition and will therefore be closed, thus throwing hundreds of workers out of employment. This argument is strengthened by the fact that not only is the cost of producing a ton of coal increasing under present condition; but the per capita output of the mines is decreasing. And this is the case in spite of vastly improved appliances, equipment, sanitation and transportation.

NOTES ON COST OF DIAMOND DRILLING IN THE BOUNDARY DISTRICT.*

BY FREDERICK KEFFER, Greenwood, B.C.

(Nelson Meeting, January, 1908.)

Two years ago I contributed to the Institute a paper on the results of diamond drilling as carried on at the mines of the British Columbia Copper Company, Limited, during 1905. That paper gave some details as to costs, and the period covered was but eight and one-half months. Since that year drilling has been carried on more or less continuously in the mines of the company, and the results of this work, so far as progress and costs are concerned, are given in detail in the following tables.

The Progress Table gives the monthly results of work as well as the yearly totals. It is of course important to know the general character of the rock drilled in order to institute comparisons with other localities. In the narrow limits of this table it is not possible to give details as to rocks, but as nearly as possible the rocks comprise diorites, compact garnetites and certain very hard and silicious eruptives occurring in Summit camp. The medium hard rocks include all ores, and, in Deadwood camp, much of the greenstone country. The soft rocks are the limestones, porphyries and serpentines. Of all rocks drilled the garnetites proved much the most severe in diamond consumption, as is illustrated by the work from May to August, 1907, which was mainly conducted in garnetite with some silicious limestones.

Eight hours constitute a shift underground, and nine hours on the surface. On Sundays no work is done apart from repairs to machinery. In May, 1906, the labor was contracted as an experiment, but was abandoned as being unsatisfactory.

The Cost Table gives details of costs under the four groups of Labor, Power, Repairs, Oils, etc., and diamonds. The employees were, normally, a runner and a setter. Extra help was required at times for blasting places for good set ups, for laying pipe lines, moving plant, etc. In August, 1907, two shifts were employed. In June and July of that year the increase in labor costs is mainly on account of the long pipe lines required. The power consumed is taken as being equivalent to that required for a 3 1-4 inch machine drill, that is to say, about 20 h.p. When drilling at a mine, where for example 15 machines are used on each shift, the diamond drill is charged with 1-31 of the total power costs—it being in this instance run on one shaft only.

Where steam power is used either directly or through a steam driven air compressor, the costs are much increased. Where, as in some cases, an isolated 24 h.p.

(*) This month's work was contracted as to the labor. Feet drilled are therefore not included in averages, as contractor worked overtime.

boiler was used, the power costs are still higher, as an engineer has to be provided as well as a team to haul wood.

Tools, repairs, etc., include these items as well as all small miscellaneous expenses. The increasing cost of diamonds added materially to cost per foot in 1907.

The third table is a summary of the first two, and shows an average cost per foot for the two years of $1.705. The carats used per foot are 0.572-64, or in more intelligible decimals, .00893 carats, so that one carat on the average drilled 111.9 feet. All holes over 30 degrees dip are classed as vertical, and feet per hour in horizontal holes is about 15 per cent. greater than in vertical ones. The average depth of holes is 81.3 feet, and diameter of cores is 7-8 inch.

In comparing these costs with contractors' prices, it must be borne in mind that contractors usually require air (or steam) and water to be piped to the work, and the mine must in addition furnish the air and water free of charge. In the present cost sheets all these items are charged against costs of drilling.

A RAPID METHOD FOR THE ESTIMATION OF ARSENIC IN ORES.*

By HARTLEY E. HOOPER, Associate.

The following method was arrived at after exhaustive trials of the usual volumetric and gravimetric processes, which were all found to be either too slow and tedious, or to require too much delicate manipulation for rapid technical work. It is suitable for sulphide or oxidized ores containing upwards of 1 per cent. of arsenic. Such ordinary constituents of the ores as lead, copper, zince, iron, manganese, or nickel do not interfere, being either precipitated as oxides or else having no reaction with the iodine thiosulphate titration.

The reactions which take place are as follows:—

$$As_2O_5 + 4KI = As_2O_3 + 2I_2 + 2H_2O$$
and $$2Na_2S_2O_3 + I_2 = 2NaI + Na_2 2S_2O_3$$

The solutions required as:—

$Na_2S_2O_3 5H_2O$ 33.1 grm. per litre
then 1cc. = 0.005 grm. of arsenic.

Sodium hydrate 25 per cent. solution.

The sodium thiosulphate may be standardized either against copper or arsenious oxide.

Copper.—Take 0.3 grm. of copper, dissolve in 10 cc. dilute nitric acid, boil off nitric fumes, add ammonium hydrate till jus talkaline, boil off the excess of ammonia and then add 1 cc. of glacial acetic acid, cool, add potassium iodide and titrate with sodium thiosulphate. Then the copper value multiplied by 75 and divided by 127.2 gives the arsenic value of the solution.

Arensious Oxide.—Take 0.264 grm. of pure arsenious oxide, add 5 cc. of concentrated nitric acid, evaporate to dryness and heat strongly for a few minutes, take up 25 cc. with sodium hydrate solution, warm and then make up the bulk of the solution to 50 cc., neutralize with concentrated hydrochloric acid and then add 25 cc. in excess, cool, add potassium iodide and titrate until the solution becomes perfectly colorless. Test the solution with starch, and if it shows any deep blue coloration the standard must be repeated.

Treatment of Ore.—For ores containing about 20 per cent. of arsenic take 0.5 grm., place in a 12 ounce tumbler beaker and add 10 to 15 cc. of a moderately strong solution of potassium chlorate in concentrated nitric acid, evaporate gently to complete dryness and allow to heat for a few minutes to get rid of all oxidizing matter. Cool, add 10 cc. dilute ammonium hydrate, bring to boiling to disintegrate the mass and then add 25 cc. of the sodium hydrate solution; boil again and filter hot, and wash with hot water. The filtrate should not exceed 50 cc.—if it does, evaporate down to about 50 cc.; neutralize with concentrated hydrochloric acid and treat as in standard.

Notes on the Method.—The proportion of hydrochloric acid to the bulk of the assay should be about one-half or three-fifths; if less acid be present a reverse reaction sets in, the arsenious oxide being oxidized to arsenic oxide, shown by the color going and coming during the titration. If too much hydrochloric acid be present the potassium iodide will not dissolve and the sodium thiosulphate is decomposed and sulphur is precipitated, disguising the finish. The titration should be done slowly, especially towards the finish, and if the yellow color returns a few drops of thiosulphate will discharge it, and the higher reading should be taken.

The starch indicator is of no use in the titration, but may be used to confirm the finish. In the strong hydrochloric acid solution the thiosulphate will not discharge the starch color. For exact work it is advisable to take a blank assay of water and hydrochloric acid in the right proportions, add potassium iodide and titrate. This is to allow for any free chlorine being present in the acid.

If antimony be present, instead of dissolving the ore in nitric acid it should be fused with sodium peroxide in a nickel crucible, the alkaline water extract being treated as before.

The following experiments were performed to test the accuracy of the method:—

The Use of Stach Gave the Following Results.—50 cc. of water plus 30 cc. hydrochloric acid plus potassium iodide took 0.1 cc. of standard thiosulphate, giving an instant finish, and, on the addition of starch, no color. Similar amounts using starch required from 0.5 cc. to 1 c.c. and then would show no definite finish.

Effect of Varying Hydrochloric Acid.—A solution of sodium arsenate in water containing the equivalent of 0.1 grm. of arsenic in 50 cc. was in each case.

	Arsenic solution.	Hydrochloric acid.	Thiosulphate required.
1.	50 cc.	10 cc.	22.1 cc.
2.	50 cc.	25 cc.	22.2 cc.
3.	50 cc.	30 cc.	22.2 cc.
4.	50 cc.	50 cc.	about 22.0 cc.

In (1) the color went and came during the titration.

In (2) the finish was fairly sharp, but the starch gave a color on standing.

In (3) the finish was sharp, and the starch gave no color on standing.

In (4) the potassium iodide did not dissolve until well on with the titration, and towards the end the thiosulphate was decomposed, precipitating the sulphur and disguising the finish.

*A paper read before the Institution of Mining and Metallurgy.

Effect of Varying Sodium Chlodide:—

	Arsenic. solution.	Hydrchloric acid.	Sodium chloride.	Titration.
1.	50 cc	30 cc.	2.5 grm.	22.1 cc.
2.	50 cc.	30 cc.	5 grm.	22.2 cc.
3.	50 cc.	30 cc.	10 grm.	22.15 cc.
4.	50 cc.	30 cc.	20 grm.	22.2 cc.

In (3) the sodium chloride only dissolved during the titration, and in (4) a considerable portion was left undissolved, rather disguising the finish.

Effect of Potassium Chlorate.—A blank assay was done using 15 cc. of the nitric acid potassium chlorate solution and evaporating to dryness. The titration required only 0.1 cc. of standard thiosulphate.

The Moose Mountain Iron Range, with Special Reference to the Properties of Moose Mountain, Limited.*

BY NORMAN L. LEACH, Sudbury, Ontario.

(Ottawa Meeting, March, 1908.)

The conformation of the Moose Mountain Iron Range has been traced in a general manner and found to extend in a northwesterly direction from the northwest shore of Lake Wahnapitae, in the district of Nipissing, to Onaping Lake, in the district of Algoma, a distance of approximately thirty-five miles.

Twenty-five miles due north of Sudbury, in the twonship of Hutton, are situated the properties of the Moose Mountain, Limited. The existence of iron ore in this township has been known in a general way for years. During the gold excitement of the "nineties," prospectors travelling the West Branch of the Vermilion River, in search of the yellow metal, portaged across a ridge of the "No. 2" deposit at a point known as the "Iron Dam," the wearing away of the moss on the portage having exposed the ore in several places.

In 1901 and 1902 Sudbury prospectors, though Mr. Chase S. Osborne, of Sault Ste. Marie, Michigan, succeeded in interesting Mr. John W. Gates, of New York, and associates, in the property. Enough exploratory work was then done to prove its value and negotiations commenced with the object of securing rail connections with the Georgian Bay.

Messrs. Mackenzie & Mann, appreciating the possibilities of the ore tonnage as a source of revenue for their railroads, became interested in the property, and as a result a branch of their Canadian Northern Ontario Railway, from Toronto to Sudbury, has been built from Sudbury North to the mines, a distance of 35 miles. A six mile spur from the main line, a few miles south of the French River, has been constructed to the Georgian Bay at a point known as Key Inlet, and is the final link connecting the mines with the Great Lakes, making a rail haul for the ore of about eighty miles, or about the same average haul of the three iron-ore-carrying roads of Minnesota.

Ore docks for the transhipment of the ore are now under construction by the Mackenzie & Mann interests at the "Key." A splendid natural harbor has been secured there with twenty-four feet of water alongside the ore docks, more than enough to float the largest vessels on the Great Lakes; and the "Key" as a shipping point by water is 500 miles nearer any of the iron ore receiving ports, as compared with shipments from the head of Lake Superior. This will be a considerable factor in the securing of favorable lake freight rates.

The docks are of unique construction, and will be unlike any on the Great Lakes for the handling of iron ore. The ore from the mines, loaded in hopper-bottomed cars, is dumped from a trestle to a stock pile ground beneath. Under this stock pile ground, in line with the centre line of the trestle, is a tunnel through which a forty-two inch belt will convey the ore to a similar belt at the water's edge, which in turn conveys and elevates the ore to the dock trestle, sixty feet above the water level. It is then tripped off the belt, weighed by an automatic device, and dumps into pockets from which it will be spouted into the hold of the vessels alongside the dock. It is expected that these belts will have a capacity of eight hundred tons of ore per hour.

Development work at the properties of the Moose Mountain, Limited, has proven the existance of several large deposits of merchantable ore, principally magnetite, and a small amount of hematite. The ores occur in the following rocks of the Keewatin age. Those in close proximity to the ore bodies consist principally of diorite, diabase, hornblende-schist, hornblende-gneiss, all of which may be collectively referred to as greenstone. In a few instances granite comes into contact with the ores. Numerous exposures of magnetic ores are to be found. Where weathered the ore presents grey, dark green and black appearances, and for shipment the ores have a steel grey appearance. These ores can be delivered to any blast furnaces in Canada or the United States, tributary to the Great Lakes, and the product from the Moose Mountain mines will be disposed of in the above markets.

The present guaranteed analysis on ore sales is:—

Iron	55. 50
Phosphorus	.10
Silica	13. 29
Manganese	. 02
Alumina	1. 21
Lime	3. 60
Magnesia	3. 15
Sulphur	.011
Titanium	none
Moisture	1. 00

So far actual mining operations have been confined to "No. 1," or original "Moose Mountain" deposit. The surface of the ore body at this point is approximately 140 feet above the level of the railroad loading tracks. The ore is won by overhand stoping, from an open face of from 60 to 70 feet in height, trammed out to a large chute discharging thirty feet below the level

*Journal of the Canadian Mining Institue. Part of Vol XI.

of the bottom of the present stope into a No. 8 Austin gyratory crusher, which reduces it to a maximum size of five to six inches diameter. Leaving the number eight crusher the ore passes through a revolving screen 48 inches by 12 feet with 1-4 inch perforations, the rejections going direct to the foot of the elevator pit, and the balance to a No. 5 Austin gyratory crusher discharging into a 14-inch by 30-inch buckets of a fifty-two foot centre belt elevator, which elevates the ore into the loading bins, whence it discharges through hoppers into the railroad cars.

A 16-inch by 42-inch Jenckes Corliss engine, to drive the crushing plant, and two 150 h.p. return tubular boilers, constitute the present power plant, the machine drills having been operated by steam up to the present time.

Very little systematic exploration work has been done upon the Moose Mountain Range as yet, and when it is remembered that upon all of the older ranges of the Lake Superior country millions of dollars have been, and are still being, spent in the systematic search for new ore bodies—and that all these iron ranges show more ore in sight to-day than they ever did—it seems a reasonable possibility that careful explorations in the future will reveal still other bodies of high grade merchantable ore in the Moose Mountain District.

THE IRON ORES OF ONTARIO.*

By A. B. Willmott, Sault Ste. Marie, Ont.

(Ottawa Meeting, 1908.)

This article, like many of its predecessors, must be a record of what we are going to do in the development of the iron ore resources of Ontario, rather than of what we have accomplished. It will be a statement of the opportunities open for the iron-ore miner, rather than a statement of results attained. The production of iron ore in Ontario has been as follows:—

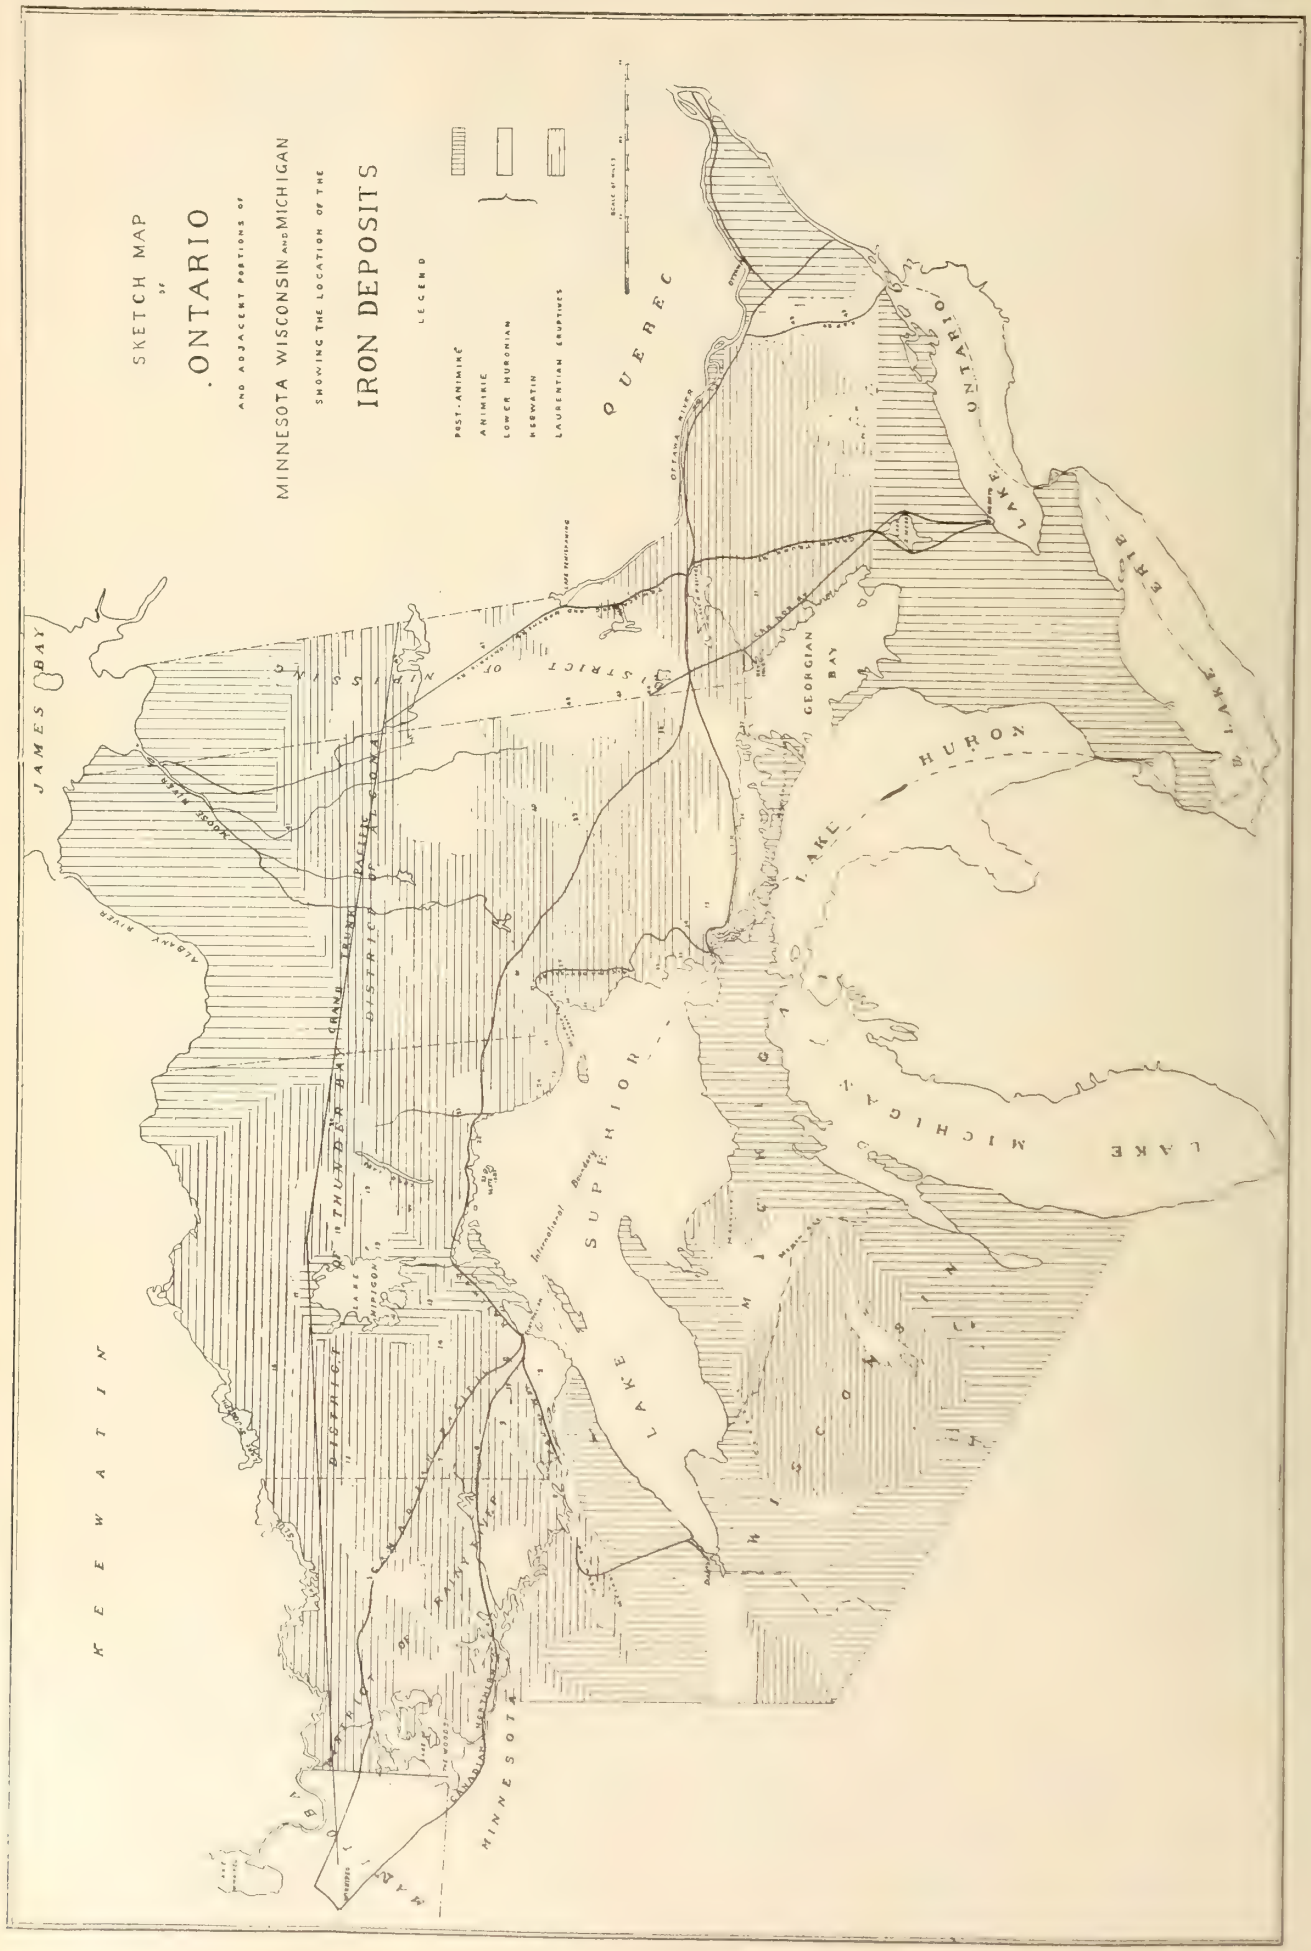
	Tons.	Value.
1869-1896	582,542	$1,445,225
1897	2,770	4,996
1898	27,409	48,875
1899	16,911	30,951
1900	90,302	111,805
1901	273,538	174,428
1902	359,288	518,445
1903	208,154	450,099
1904	53,253	108,068
1905	211,597	227,909
1906	128,049	301,032
1907	160,000?	350,000?
	2,113,813?	$3,771,835?

Character of Ores.

Hematite.—We have in Ontario all the usual varieties of merchantable iron ore. Of the total production by far the larger amount, namely, about one and a half million tons has been of hematite ore. So far as this has come from the Helen mine there has been mixed with the pure hematite a certain amount of limonite and goethite, which would make the product of that mine strictly classed as brown hematite. An average analysis of 20,000 tons of the earliest shipments from the Helen, runs as follows:—

	Per cent.
Moisture at 212 degrees F.	6.610
Iron	58. 70
Silica	5.660
Alumina	0.730
Lime (CaO)	0.210
Magnesia (MgO)	trace
Phosphorus	0.114
Sulphur	0.047
Organic matter & combined water	9.670
Insoluble	6.040

The average cargo analysis for 1901 was 58.709 per cent. iron, and for 1907 just a shade better, showing that this property has maintained its grade as depth has been attained. Ores similar to the Helen have been discovered and explored at several other points, as Steep Rock, Frances, and Josephine, but as yet there has been no production. From a number of properties in Eastern Ontario, of which the Wallbridge, Dalhousie and McNab are the chief, about 150,000 tons of hematite have been produced. These ores have been good in their iron, phosphorous and sulphur contents, and carried small percentages of lime which was an additional advantage. All these eastern deposits have so far proved small, and there is reason for believing that some of them, if not all, are oxidized portions of iron pyrites beds lying below. From the Stobie mine, in Aberdeen township, a few small cargoes of specular hematite of good quality were shipped some years ago. Similar specular hematites occur in the quartzites of the Lower Huronian, at a number of points, as at Killarney, Algoma Mills, and around Echo Lake. In Aberdeen township a vein of high grade hematite occurs at the contact of a quartzite and slate conglomerate, and has been traced by pits at intervals for over a mile.



Analysis shows as, as follows:—

	Per cent.
Iron	65. 60
Manganese	. 10
Silica	1. 73
Alumina	1. 31
Lime	. 39
Magnesia	trace
Phosphorus	0.045
Sulphur	.005

A somewhat slaty hematite occurs on the Williams property a few miles north of Sault Ste. Marie, Ont. A silicious hematite, but otherwise of excellent quality, occurs in the flat lying Upper Huronian, at Loon Lake, east of Port Arthur.

Magnetite.—Of the total production of the province about 600,000 tons have been of magnetite. For the most part these ores have been high in iron, low in phos-

phorus, high in sulphur, and with titanium absent. The average of ten samples of Belmont ore taken by Prof. Miller, runs:—

	Per cent.
Iron	60. 02
Phosphorus	.015

A shipment of 800 tons from the same mine averaged:—

	Per cent.
Iron	57.38
Phosphorus	.01
Sulphur	.08

A shipment of 8,514 tons of Farnum ore ran, iron, 54.05; phosphorus, .018 and sulphur, .059; titanium, nil. A pile of 7,000 tons of ore from the Wilbur Mine averaged 57 per cent. iron, and under .01 phosphorus. Thirty-seven determinations for phosphorus made by Ingall on magnetites from the vicinity of the Kingston and Pembroke Railway ran from a trace to .17, averaging .022.

From the northern part of the province magnetites have been mined this past year, and will be shipped in an increasing amount next year. Atikokan ore from mining locations E. 10 and 11, has been smelted this season in the furnace of the Atikokan Iron Company, at Port Arthur. Surface samples from this property run, iron, 66.5; silica, 3.2; phosphorus, .015 and sulphur, .01, according to sampling and analysis by Hille[1]. An average of seven samples of the best ore from a number of diamond drill cores is given by Hille, as iron, 59.3; phosphorus, .069; sulphur, 1.09, and this probably fairly represents the ore when below the zone of oxidation. The ore is being roasted by blast furnace gas before being smelted, and is giving excellent results in the manufacture of foundry pig.

A property a short distance to the west has been explored this past year by the United States Steel Corporation, and purchased by them. Surface samples show magnetite running from 53 per cent. to 67 per cent. in iron, .007 to .058 in phosphorus, and .07 to .5 in sulphur.

Another property which will this year begin shipping magnetite is the Moose Mountain, lying north of Sudbury, of which the guaranteed analysis is, iron, 55.0; phosphorus, .10; and sulphur, .011.

TITANIFEROUS MAGNETITE.—There are throughout Ontario a number of considerable ore bodies of titaniferous magnetite, such as the old Chaffey mine, and the Matthews mine, on the Rideau Canal, from which several thousand tons were shipped years ago. Near Gooderham, Ont., is a similar deposit, in connection with a large gabbro intrusive. Near Chapleau, Ont., a magnetite deposit carries 10 per cent. titanium. The Orton mine in Hastings county, an undeveloped prospect, carries from 1 per cent. to 3 per cent. titanium. In twenty-five samples of magnetites taken by Ingalls along the Kingston and Pembroke Railway, titanium was absent in 13, and 12 went between 1.03 per cent. and 16.45 per cent. Numerous other occurrences are known, but in practically every case titanium is absent from the magnetites and hematites of Ontario, except where the deposit is connected with basic eruptives.

LIMONITE.—Bog ore occurs at many points throughout the province, as deposits resulting from the leaching of the glacial drift. There are also numerous deposits resulting from the weathering of iron pyrites, and some from the weathering of iron carbonate.

Back as far as 1813 small quantities of bog ore from Norfolk county were smelted in a small furnace at Normandale. In more recent years bog ores from Oxford county and vicinity have been smelted in small quantity at Hamilton. As already mentioned a percentage of limonite is mixed with the Helen ore, which has been classed as a hematite. Bog ores resulting from the oxidation of pyrites occur at Paint Lake in western Michipicoten, Goudreau Lake, near Missanabie, and in the vicinity of the Josephine. Similar ore is seen near some pyrites deposits near Steep Rock Lake, and also in Parkin township, north of Sudbury. Eleven cars of limonit, from what afterwards became the Bannockburn Pyrites mine, were smelted at Hamilton. The better class of such ores run from 50 per cent. to 55 per cent. in iron, and under; .5 per cent. in sulphur. On the Mattagami River, there is a limonite deposit resulting from the oxidation of iron carbonate occuring in the Devonian limestone. This ore runs from 48 per cent. to 57 per cent. in iron, about .1 in sulphur, and from .1 to .2 per cent. in phosphorus. Smilar ore is found at a number of points in the valley of the Moose River, and its branches, originating in a similar way.

SIDERITE.—In connection with a number of hematite deposits in Ontario, quantities of siderite are found, which may yet become of commercial value. On the hill back of the Helen mine, there are exposed siderite lenses aggregating a width of 136 feet, and averaging 34.94 per cent. in iron, and 7.7 per cent. insoluble. A picked specimen yielded:—

	Per cent.
Insoluble	4.38
Carbonate of iron	78.57
Carbonate of lime	4.09
Carbonate of magnesia	12.84
Alumina	trace
Total	99.88
Metallic iron	37.71

Ore of this character in considerable amount is found at the Josephine, at Steep Rock Lake, and at other points throughout the privince. It is almost always contaminated with sulphur up to 1 per cent. or 2 per cent., and but for this might be considered a fair ore of iron. It is low in phosphorus, and on roasting would yield a product running 50 per cent. in iron, and the roasting would eliminate the sulphur. The magnesia and lime present would serve as useful fluxes.

In the vicinity of Port Arthur in the Animikie formation are considerable bands of siderite, somewhat lower in iron content, and correspondingly higher in silica. The bands correspond to the taconite of the Mesabi range, though they are higher in carbonate of iron. One deposite north of Port Arthur is said to be 500 feet long by 100 feet wide, by 12 feet deep, and to average 33 per cent. iron. On the Opazatika River, and on other tributaries of the Moose, iron bearing limestones are found. These carbonates are probably too low in iron ever to be of direct value as an iron ore; possibly, however, bodies of hematite may yet be found in their vicinity.

MAGNETIC SANDS.—At many points in the province iron sands are being, or have been, concentrated by the waters of the Great Lakes. Such a deposit is found in the vicinity of Peninsula Harbor, on the north shore

of Lake Superior. On the north shore of Lake Erie a small amount of such sands was smelted in the furnace at Normandale nearly 100 years ago. It is improbable that these sands can be made of commercial value at the present time.

Geological Classification of Ores.

The geological formations occurring in Ontario, beginning at the most recent, are as follows:—

Cenozoic	Pleistocene
Paleozoic	Devonian Upper Silurian Lower Silurian Cambrian
Pre-Cambrian or Archean	Keweenawan or Nipigon Animikie or Upper Huronion Middle Huronian Lower Huronian (Laurentian Eruptives) Keewatin

In this classifiaction the recommendations of the International Committee on the succession in Lake Superior region have been followed.[3] The Laurentian granites, etc., which used to be considered the base of the geological column are now recognized as eruptives, always later than the Keewatin, and very frequently later than the Middle Huronian. In the Eastern section of the province, the International Committee recommended the following succession from below, Laurentian, Grenville, but Miller has shown (bur. of Mines, Vol. 16, page 221) that rocks undoubtedly Keewatin occur in that section of the province, and that the Grenville is really an upper portion of the Keewatin. Miller further finds an overlying formation carrying pebbles of the Grenville, which he considers Huronian. His classification corresponds closely with that adopted for the Lake Superior region, and permits an orderly arrangement of many facts, which did not fit with the previous classification.

In the Pleistocene we have the insignificant deposits of bog iron. In the Devonian there are some siderite deposits now altering to limonite in the valley of the Moose River, which are as yet unknown, and so far of no commercial value. The Clinton formation of the Upper Silurian is in Ontario, commercially barren, although a small deposit has been found near Cabot Head. The base of the Medina of the Upper Silurian is marked by red ocherous clays, which are, however, of no value. At the base of the Potsdam of the Cambrian, there are some deposits of impure hematite, such as that at Dog Lake, north of Kingston. At the base of the Keweenawan again, there are some ocherous clays, which in places almost approach iron ores, but are so far of no commercial value. In the Animikie there are possibilities of commercial ores. This formation is the one which on the United States side of Lake Superior carries the Mesabi, Gogebic and Menominee iron range. It is found in Ontario in the triangular area between the Port Arthur, Duluth and Western Railway, Lake Superior and the American boundary. At numerous points in this area indications of ore have been found, and large ore bodies have been developed at Loon Lake. In the vicinity of Sudbury is another Animikie area, but so far as known carrying no iron deposits. Except these two areas, and a few other very small areas the Animikie is unknown in Ontario. North of the province on the eastern shores of James Bay, rocks apparently of the Animikie series are found on the Nastapoka Islands. Here very considerable bodies of iron ore have been found, and when transportation difficulties are removed these ores will undoubtedly come on the market.

The Lower Huronian formation is widely distributed throughout Ontario, the typical region being that north of Lake Huron. It should be noted that all the older geological maps and reports by Canadian Geologists. use the term Upper Huronian for what is now called Lower Huronian, and similarly Lower Huronian was used in the older reports for what is now termed Keewatin. On the accompanying map the areas of Keewatin and Lower Huronian are outlined with as great accuracy as our present knowledge of the unsettled regions of Ontario will permit. It has not proved possible to show them separately on a small scale map even when the information was at hand to do so. So far little iron ore of commercial value has been found in the Lower Huronian areas. In Deroche township north of Sault Ste. Marie, some prospecting has been done with fair results. In Long and Rutherford townships, deposits of specular hematite have been found in small quantities. In Aberdeen township a more promising prospect occurs. All of these deposits are associated with quartzite or slate. The banded jasper and hematite of the Marquette range is for the most part absent in the typical Lower Huronian area. In Harrow township the typical iron formation does, however, occur in the Lower Huronian, and at two other points iron carbonate has been found.

In the Keewatin the most promising iron deposits of Ontario are found. This formation is very widely distributed and in practically every place where Keewatin or Huronian are marked on the various geological maps, bands of sedimentary iron formation can be found. These may be small in extent, representing only the last remnants of a large area, or they may be long and narrow belts. Usually the bands are only a few hundred feet wide; almost always less than half a mile. Most frequently there are a series of lenses ranged in a row or occasionaly in a few parellel rows. At times the iron belt extends for many miles enclosed on either side by green schists. The Nipigon-Long Lake belt is almost continuous for 70 miles.

The ores associated with the basic intrusives may occur in different periods, but seem to be all pre-Cambrian.

The iron ranges on the American side of Lake Superior show a close similarity geologically to those in Ontario. As seen on the map the various producing ranges occur in Keewatin, Huronian and Animikie series of the Archean. These formations occur as narrow belts between the eruptive granites, just as in Ontario. The characteristic association of banded jasper with ore is true on both sides of the lake. In the following table the total production of the different ranges is given.

Range.	Year opened.	Total tons.	Shipments per cent.
Marquette	1885	84,846,280	22.3
Menominee	1877	63,806,652	16.7
Gogebic	1884	54,023,478	14.2
Vermilion	1884	26,785,950	7.0
Mesabi	1892	150,198,054	39.4
Ontario	1900	1,361,000†	.4
		381,024,414	100.0

The Ontario production is made up mainly of shipments from the Helen mine on the Michipicoten range, and the McKellar property on the Atikokan. Both of these properties are in the Keewatin formation, as also are the mines in the Vermilion. The mines of the Menominee, Gogebic and Mesabi are all in the Animikie, and most of the Marquette production comes from the Lower Huronian, although a portion of it is at the base of the Animikie, practically at the contact with the Lower Huronian. Assuming that the whole of the Marquette jroduction is from the Lower Huronian, one finds that of the total production of iron ore from around Lake Superior, 70.3 per cent. has been produced from the Animikie, 22.3 from the Lower Huronian, and 7.4 from the Keewatin.

Comparison With Scandinavian Ores.

In the transactions of the American Institue, 1907, a classification of the Scandinavian Iron Ores is given by Prof. Sjorgen. Considering the similarity between the general geological conditions of Scandinavia and northern Ontario, a comparison is of interest.

1. Ores of the Archean Crystalline Schists.
   - A. Apatite Ores.
   - B. Mixed Hematite and Magnetite.
   - C. Quartz Banded Ores.
   - D. Skarn Ores.
   - E. Limestone Ores.
2. Ores of the Porphyries.
3. Magmatic Segregations in Basic Eruptives.
4. Iron Ores of Metamorphosed Cambro-Silurian Schists.
5. Contact Deposits in the Christiana Region.
6. Lake and Bog Ores.

Of these groups numbers 2, 4 and 5 are not found in Ontario. While eruptive porphyries occur, so far we have no iron ores associatel with them. In Ontario there are no metamorphosed Cambro-Silurian Schists, nor eruptives of the post-Silurian age, so that groups 4 and 5 are impossible. The other groups 1, 3 and 6 are found in Ontario, and closely resemble the corresponding deposits in Scandinavia. The Apatite ores of group 1, resemble closely the ore mined in the Lake Champlain region of New York State, which again is closely paralleled by some deposits in eastern Ontario. The mixed hematite and magnetite deposits free from banded material are not common in Ontario, but the deposit north of Cartier would seem to resemble corresponding deposits in Scandinavia. The quartz banded ores are extremely common in Ontario, more so than in Scandinavia. Typical occurrences are those of the Mattawin, Michipicoten and Temagami ranges. The Skarn ores and Limestone ores of group D. and E. can be paralleled from some of the minor deposits in eastern Ontario. Magmatic segregations in basic eruptive rocks, group 3, are very common in Ontario, and titaniferous as in Scandinavia. The lake and bog ores of the two countries are naturally similar.

Genesis of Iron Ores.

As previously stated the majority of the Ontario ores occur in the Keewatin formation. At the base of this series is a mass of greenstone frequently ellipsoidally parted, which is the oldest known rock of the Lake Superior area. Overlying this are various green schists, and towards the top of the series the iron formation proper. This consists of ferruginous cherts more or less banded with hematite and magnetite, iron carbonate and iron pyrites. Carbonated schists frequently border the iron formation. Originally these belts seem to have been a chemical sediment, but are now found in nearly every case closely folded, and standing nearly vertical. Transverse folding has been a very common occurrence, and the anticlines have been frequently eroded until the formation has been cut off into separate lenses, varying from a few feet to a few miles in length. In most cases the width of the formation is a few hundred feet, and occasionally up to half a mile. Folded with the iron formation there is usually a bed of green schists which forms an impervious layer at the bottom of the basin. The American geologists who have closely studied the Vermilion and other south shore ranges are of the opinion that the ores associated with these ranges have resulted from decending water concentrating the leaner ores from above, in the bottoms of these basins. Iron carbonate is supposed to have been the most frequent source of the ore, but both iron silicate and iron pyrites have also contributed. Probably in our Ontrio ranges iron pyrites is a larger contributer than in the ranges to the south, as it occurs much more frequently in the ranges to the north of Superior than to the south. In some few cases the original deposits in connection with the formation seems to have been rich enough to make an iron ore without further concentration. In other cases there are lean silicious magnetites up to 40 and 45 per cent., which can hardly be classed as commercial ore bodies, and which might well represent original deposits without secondary concentration. In these the silicious bands are absent, the silica being more evenly distributed through the whole mass. Another class of ore bodies includes those which are regularly banded, consisting of either hematite or magnetite, alternating in narrow bands from 1-8 inch to 2 inches in width, with bands of quartz, which may be white chert, or red or black jasper. It is with the more granular cherts that the hematite ore bodies so far discovered have been found.

Special Descriptions.

An attempt has been made to show on the map the principal areas in which iron ores have been found, and to add here a very brief description concerning them. It is probable that in every area shown on the map as containing Keewatin rocks, the iron formation will be found when search is made. In the following descriptions the numbers after the names refer to the corresponding numbers on the map.

The Dryden and Wabigoon area (1) shows a number of bands of lean silicious magnetite with assays running in the vicinity of 40 per cent. iron. Kaiarskons Lake deposits (2) of silicious magnetite with some higher grade lenses have been slightly explored. Parallel to it is a belt of iron pyrite characteristic of the Keewatin ranges. At Bending Lake (3) a number of locations have been taken up on a silicious magnetite somewhat similar to the two previous ones. In Watten and Halkirk townships on Rainy Lake (4) a band of the iron formation has been found, containing magnetite and particularly rich in sulphides. It is traceable at intervals for some miles either way, and is really part of one belt extending from Fort Frances up the valleys of the Seine and Atikokan as far as Magnetic Lake, a distance of slightly over 100 miles. At Steep Rock Lake (5) the formation has been considerably bent. Diamond drilling on the eastern arm

of Steep Rock Lake, and also on Strawhat Lake has disclosed fair bodies of hematite ore. In these cases, as in several others in Ontario, bodies of iron pyrites are found in close contact with, but not contaminating, the hematite ore. Considerable bodies of siderite also occur. Through the valley of the Atikokan (6) are a number of deposits of magnetite standing out as low hills in the valley, and accompanied by various green schists. These magnetites are low in phosphorus, but high in sulphur. The deposit of McKellar's is now being worked by the Atikokan Furnace Company, and a property a short distance west of this, after careful exploration, has been bought the past year by the United States Steel Corporation. On Fire Steel River (7) bands of pyrites are known, which represent the iron formation in that belt of Keewatin. On Hunters Island (8) there are several parallel belts of the iron formation which may represent a folding of the Keewatin, but possibly as suggested by Leith some of the belts are Huronian. The Hunters Island range is in line with the Vermilion, and distant from the closest part of it about 20 miles. There has been little exploration beyond surface work, but it is reported that the little drilling done was fairly successful. At Greenwater Lake (9) is a continuation of the Vermilion-Hunters Island belt, and this continues to the east through the Mattawin area (10) and Conme and Ware townships (11). These last three occurrences are all similar in character, showing banded jaspers with magnetite and hematite. Picked samples from the surface of locations on the Mattawin, yielded 58 per cent. to 68 per cent., iron, .013 to .056; phosphorus, .054 to .164; sulphur and titanium, nil. The amount of ore in this belt is very considerable, but so far the limited exploration which has been done has not revealed any large concentrations. The ore is favorably situated for transportation, and could be quarried from hillsides. Until, however, the higher grade ores are mined out, it is questionable whether these surface deposits running 40 per cent. in iron can be economically concentrated. There is, however, a probability that bodies naturally concentrated may be found, if properly sought. The Animikie formation (12) occupies a considerable area round Lake Superior, and at many points within it carbonate of iron, running 20 per cent. to 25 per cent. is found.

At Loon Lake and vicinity, 25 miles east of Port Arthur, considerable exploration work has been done, resulting in the finding of several beds of excellent hematite ore, narrow, however, in width, and separated from each other by lean material. This ore where pure is high in iron and low in phosphorus and sulphur, and carrying a little lime, is altogether an excellent furnace ore. The costs of mining and concentration are, however, problematical, and no company has yet attempted to operate commercially. Altogether there is a big tonnage of ore which will undoubtedly be valuable before long. It is only four miles from Lake Superior, and is traversed by the main line of the Canadian Pacific Railway. A second series of beds lie above those already mentioned, which contain even larger quantities of iron. This is, however, only about 35 per cent. ore, and high in phosphorus and sulphur. On Black Sturgeon River (13) are some deposits of hematite in the Keewatin of a promising character. At Little Pike Lake (14) specular hematite interbanded with a gray slate occurs on a number of locations taken up some years ago, but on which no work has been done. At Savant Lake (15) the usual iron range rocks of the Keewatin occur, and search may result in the finding of merchantable ore. On Whitearth Lake (16) iron range rocks are reported. At Cariboo Lake (17) lean silicious magnetite is found over a large area, also at Mud River, somewhat to the east. In the valley of the Red Paint (18) the Keewatin formation is traceable for some miles, and some diamond drilling was in progress last year. The Nipingon-Long Lake (19) belt is 70 miles long and almost continuous. At the Nipigon end three parallel belts are found, the centre hematite, and the north and south magnetite. A little drilling has been done but not enough to determine definitely. At Little Pine Lake (20) a similar formation occurs, and also on the Slate Islands (21). On Lake Superior at the mouth of the Little Pic (22), locations were taken up years ago for a magnetite associated with a basic eruptive. The ore is lean and probably useless. Ten miles up the Pic River (23) are some magnetite locations showing iron ore carrying about 45 per cent. and contaminated with a little sulphur. At Otter Cove (24), in a small fragment of the Keewatin, a lean magnetite occurs. At many points throughout the Keewatin belt of the western part of Michipicoten (25) the usual iron range rocks are found. Towards Lake Superior these occurrences are silicious magnetites; further north they are banded cherts with hematite and magnetite. At the Frances diamond drilling has shown towards the bottom of one of these basins, considerable hematite of good quality. In central Michipicoten we have characteristic banded cherts and hematite at a number of points. At the Helen Mine (26) is the largest ore body yet exploited in the province, which has yielded about one and a third million tons of ore to the end of 1907. Associated with this ore, as is so often the case, are deposits of pure pyrites. At the Josephine (27) drilling has shown considerable ore, under the waters of Parks Lake. The iron range is traceable both east and west from the lake, and theory indicated that where the iron-bearing rocks had been broken down and eroded so as to form a lake basin, a deposit of ore might be sought, and this was done successfully. Further to the north (28) the range is so rich in sulphur that it has become of value as a source of iron pyrites, iron oxide except as a gossan being practically absent. At Michipicoten south, lean magnetites are found at several points as at Anjigomi (29) and Bridget Lake (30). At Cape Choye (31) and eastward, an unimportant belt of Keewatin occurs, carrying lean hematite and magnetite. At Batchawana (32) banded jasper and hematite occur a few miles from Lake Superior, and six miles further back several deposits of lean magnetite. At Goulais Bay (33) a belt of the Keewatin formation runs east and west for several miles, and is enclosed by rocks of the Lower Huronian. The brilliant jasper conglomerates which occupy miles of the Lower Huronian have always proved extremely interesting, and until the discovery of this Goulais belt no source of the jasper pebbles was apparent. The probability is that this is only a small part of one of several buried ranges. In Deroche and ajoining townships there are several occurrences of hematite associated with quartzite and slate. Some of these lenses are good ore, but no large bodies have yet been found, though further development is warranted. From Aberdeen township (35) several small vessel-loads of good hematite were shipped years ago. In the northern part of the township a promising prospect of hematite is being developed, which occurs at the contact of the slate and quartzite. In the townships of Long (36) and Rutherford (37) occurrences of high grade specular hematite in the quartzite have been explored, but the deposits have proved small. North of Cartier (38) a deposit of hematite and magnetite is of considerable

promise. At Woman River (39) and north of Flying Post (40) belts of banded jasper and hematite are found continuous for some distance, and of considerable width. At the Grand Falls on the Mattagami (41) carbonate of iron and the resulting limonite are found. Further exploration of these and similar deposits occurring in the Devonian may show ores of value as soon as transportation has been provided. At Shining Tree Lake (42) and Burwash Lake (43) the usual banded ores are found. At Moose Mountain (44) is a large deposit of magnetite, which seems to be an original deposit, and not a secondary concentration from the usual leaner ores. This property is now connected with the Georgian Bay at Key Inlet by railway, and shipments will begin on a large scale next season. To the north and west banded iron continues, and is found on the Wahnapitae (45) to the southeast. Around Temagami Lake (46) are several belts of the usual iron range rocks making altogether a good many miles in length. On the Caldwell-Mulock property a little diamond drilling has been done, but with this exception these ranges are as yet unexplored. In Boston township (47) lean magnetite has been found, and a little exploration work has so far failed to locate commercial ore bodies. At Lake Abitibi (48) the usual iron range rocks occur. Along the Kingston and Pembroke Railway in Eastern Ontario are numerous deposits of magnetite which have been worked in a small way in years gone by.

Similar occurrences are found in Hastings and adjoining counties (50). In both these districts the magnetites are fairly high in iron, low in phosprus, and apt to be contaminated with sulphur. In the Parry Sound district (51) there are several occurrences of magnetite, associated with limestone. This area has not yet been mapped, so that an outline of the Keewatin and Huronian cannot be given.

Conclusions.

There is no other area in the world equal to the Lake Superior region as a producer of high grade iron ore. The only competitor is the Minette region of Germany, France and Belgium, which is being rapidly left behind. The following table shows the great increase in production which has yearly taken place on the American side of Lake Superior:

Production of Iron Ore from Lake Superior.

	Long tons.
1891	7,621,465
1892	9,564,388
1893	6,954,620
1894	7,682,548
1895	10,268,978
1896	10,566,359
1897	12,205,522
1898	13,779,308
1899	17,802,955
1900	19,121,393
1901	20,593,537
1902	27,571,121
1903	24,281,575
1904	21,726,590
1905	34,241,598
1906	38,393,495
1907	41,817,385

But even the immense resources of the American side of Lake Superior will reach an end. The serious drain on this supply is well known in the following quotation from Van Hise, one of the best authorities on Lake Superior iron mines.

"The total produce of the Lake Superior region since mining began in 1850 to 1899, inclusive, is 171,418,984 long tons. The amount mined in the decade between 1891 and 1900 inclusive is 114,017,546 long tons, or 66.5 per cent. or nearly seven-tenths of the total amount mined. The product for the year 1900 surpasses that of any previous year, and is one-ninth of the aggregate of this and all preceding years. It is certain that the product of the current decade will far surpass that of the last decade."

It is most striking that the production for 1907 is also one-ninth of the aggregate of this and all preceding years.

This season as a result of the investigation by the Tax Commission of Minnesota, it has been determined that the Minnesota deposits of ore approximate 1,170,000,000 tons. The total tonnage for the Lake Superior district of the United States, including undeveloped lands, amounts to 2,000,000,000. This, on the basis of last year's consumption, will last fifty years, but as is shown in the preceding table, consumption is advancing with rapid bounds. Already lower grade ores are being marketed than a few years ago was thought possible. In 1907 the standard for iron ore was reduced from 56.7 to 55, and this will undoubtedly continue as iron ore becomes scarcer. Moreover, three-quarters of the ore serves of Minnesota are in the hands of one company. As the scarcity develops on the southern side, the search for ore among the iron formations in Ontario must correspondingly increase. As shown on the map the same geological formations are found throughout Northern Ontario as in Minnesota, Wisconsin and Michigan. One mine in Ontario has already produced one and a third million tons of ore, and two other properties have begun shipment. It will be extremely strange if the banded jasper and hematites found for so many hundred miles throughout Northern Ontario are not in places associated with iron ore, as they are on the south side of Lake Superior. When these surface indications on the Canadian side are followed up as they have been on the United States side, similar ore bodies will undoubtedly be found. The amount spent on exploration on the Vermilion range alone, between Tower and Section 30, a distance of say thirty miles, probably surpasses all the money spent in actual exploration of the hundreds of miles of similar ranges in Northern Ontario. Not only must part of the future demands of the United States be met from Ontario, but the Ontario demand itself must also be provided for. As shown in the accompanying table we only furnished last year per cent. of the ore required for our Ontario furnaces. Indeed from 1901 and onward the per cent. of Ontario ore used in our furnaces has steadily decreased.

Consumption of Iron Ore in Ontario.

Pig made						275,558	

As stated in the beginning of this paper the record of the production of iron ores in Ontario is rather one of opportunity than of achievement.

It has been suggested by several competent geologists that the only reason that can be suggested why the iron

formations of Ontario should not overlie ore bodies as they do south of the international line would be the greater glacial erosion to the north. This reason does not appeal to me so forcibly as to some. It is generally accepted that the iron ore bodies of Lake Superior have been concentrated in underlying impervious basins by descending waters. The upper portions of the formations are left that much poorer, and it is these that have for the most part suffered erosion. In the "old ranges" of the south shore ore is being mined to a deptr of 2,000 feet, and little of it came from near the surface. Even if it be granted that glacial erosion was carried deeper in Ontario (and this might be successfully disputed) unless it cut nearly to the bottoms of the basins the ore deposits would be only slightly affected. Severe erosion of this kind would have left only shallow and isolated patches of the iron formations instead of the hundreds of miles which are found in Ontario. Moreover, drilling has already established at several points that the formation is at least 500 to 1,000 feet deep. These considerations do not apply to the flat lying Animikie, where a few hundred feet of erosion would cut to the bottom of the basins.

To my mind the most striking differences between the United States and Canadian occurrences are (1) the relative greater abundance of the Keewatin iron formation in Ontario as compared with those of Lower Huronian and Animikie age, and (2) the more frequent occurrence in Ontario of iron pyrite with the ferruginous cherts, etc., of the iron ranges. Apparently iron pyrites and iron carbonate were somewhat equally deposited in the iron formations of Keewatin times, and iron carbonate predominated in Lower Huronian and Animikie times.

PERSONAL AND GENERAL.

Mr. M. J. O'Brien, of the O'Brien Mine, Cobalt, returned early in March from Mexico and Arizona.

Mr. Floyd Harman, late manager of the Temiskaming Mining Company of Cobalt, has gone to Nevada to take charge of a mine.

Mr. J. Williamson has purchased on behalf of a New York syndicate two gold mining claims situated between Keewatin and Osterund for $24,000.

President Anthony Blum, of the Imperial Gold Mines Company (late Laurentian), Manitou Lake, has returned East after a visit to the property.

Mr. John A. McVicar, manager of the Ontario Government diamond drill, is in Port Arthur for the purpose of testing mineral properties in that district.

Mr. John Moen, a mining man of Nelson, B.C., has returned to British Columbia after a lengthened inspection of the Cobalt, Sudbury and other Ontario mining fields.

Mr. W. R. Birdwood, of Edmonton, Alta., has gone to England with a view of interesting British capitalists in a large salt deposit recently discovered near Fort McMurray.

Mr. Wm. Ogilvie, president of the Yukon Basin Gold Dredglug Company, who has been in San Francisco purchasing machinery for a new dredge, has gone to Whitehorse, Yukon, where the dredge is under construction.

Mr. C. A. Hood, of the Deister Concentrator Company, passed through Toronto on the 10th inst. on his way to Cobalt. Mr. Hood reports four No. 2 tables and two No. 3 tables in commission at the Buffalo mine, and four No. 2 at the Coniagas.

Mr. Graham Fraser, who replaces Mr. David McKeen on the directorate of the Dominion Coal Company, is one of the pioneers in the coal mining and steel industries of Cape Breton, and has been identified with the Dominion and Nova Scotia Steel Companies.

Mr. J. B. Woodworth has just returned to Toronto from the State of Sonora, Mexico, where, in the interests of a small Canadian syndicate, he has taken up an extensive gold-silver property. Mr. Woodworth has also purchased a copper property in Southern Arizona.

CORRESPONDENCE.

Kingston, Ont., March 9, 1908.

The Editor,

Canadian Mining Journal, Toronto.

Dear Sir,—May I call attention to a change in title which has lately appeared in the publication of the Canadian Geological Survey?

The time-honored and quite necessary title has formerly been "Geological Survey of Canada." Every civilized country has a Geological Survey, and it is necessary to distinguish one from aonther. Geology is common to all countries, and we might as well call ourselves "the people" instead of "the people of Canada."

At the recent meetings of the Canadian Mining Institute in Ottawa a map of Rossland was shown which had the following title: "Canada, Department of Mines, Geological Survey Branch." This is surely cumbersome enough, but the title of the last summary of operations is even less explicit, for the word Canada does not appear at all. It reads: "Department of Mines, Geological Survey." Up to 1908 all the publications have the sensible title, "Geological Survey of Canada." Why should it be changed?

Mr. J. C. Drury, speaking at the 1906 meeting of the Canadian Mining Institute, said: "As one trying to earn an honest dollar out there in British Columbia, I hope Mr. Sifton will go on and establish a Department of Mines—swallow up the Geological Survey if necessary." At that time the Geological Survey was itself a Department, and a delegation from the Institute went up to Ottawa on April 18th, 1906, to meet the Premier and the Minister of the Interior, with the object of impressing upon them the necessity of conserving and confirming the powers of the parent institution, the Geological Survey of Canada.

Yours truly,

J. C. Gwillim

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

GLACE BAY.

The present session of the Nova Scotia Local Legislature is taking up an unwonted interest in matters pertaining to coal mining, indeed an extraordinary and significant interest. Dr. Arthur Kendall, M.P.P., for Cape Breton has given notice of the following resolution:—

"That this House considers the time has arrived when the Government and people of Nova Scotia should become acquainted with all the facts, as far as they can be ascertained, relating to the coal mining industry of the province.

"That in accordance with this proposition the House resolves that a Commission, composed of members of the assembly and coal miniing experts, should be appointed, whose duties should be to enquire into and report on the following matters:—

1. The extent and condition of the province's asset in coal.

2. The condition of coal mining leases.

3. The methods employed by promoters to form companies and to obtain capital.

4. The preparation of plans for new mining enterprises and extensions.

5. The methods of mining and losses of coal to the province incident to mining.

6. The prices of coal in this province and beyond the province.

7. The remuneration of miners, provision for old age, for injuries and dependents of miners.

8. The enforcement of laws intended to lessen or prevent accidents.

9. Further requirements to prevent accidents and to afford relief to victims or the dependents of victims.

10. And other matters relating to mining."

This is a somewhat comprehensive menu, and we are left wondering what are the "other matters relating to mining" that have not been mentioned. Surely the doctor has covered the length and breadth, the depth and height, of the science of mining, the gentle art of financing, the ecomomics and the vital statistics of the industry. The work of a Commission that would thoroughly investigate all the matters referred to in the resolution above would be "no picnic." Perhaps, when they had finished their labors, they would produce that long called for and long expected text book, that shall tell us all there is to know about mining. Most of the matters brought up by the resolution appear, however, to have ben dealt with by the Government, who have announced their intention to bring in a Government measure consolidating the Coal Mines Regulation Act. There can, of course, be no doubt that the coal mining industry of Cape Breton and Nova Scotia is of such vital importance to the Province of Nova Scotia that it merits all the attention that can be devoted to it, and the present Government appear to realize this to some extent.

There is one matter which is suggested by the eighth clause of Dr. Kendall's resolution "the enforcement of laws intended to lessen or prevent accidents," and that is the personnel of the mines inspectorate of Nova Scotia. One of the facts that can be ascertained is that nothing will so tend to the prevention of accidents and the preservation of life and property as the existence of a vigilant and capable inspectorate. The men who compose the present force of inspectors are good men, we have no doubt, but they were not appointed by competitive examination, and we do not think that any of them are men with a college training.

The Inspector of Mines should be a man of considerable scientific attainments and extensive knowledge of modern mining methods, in addition to having a thorough grasp of practical mining and all that appertains to it. He should be a man that can advice and direct in case of emergency and danger, and a man whose advice could be sought and relied upon as proceeding out of a well trained experience added to scientific knowledge. No inspector should be appointed for political purposes, and "we consider the time has arrived" when no man should be appointed to an inspectorship, because of his political preferences or as a reward of political loyalty. He should be appointed because his qualifications mark him out as fitted for such an onerous and responsible position. To-day when mines are at work in Nova Scotia with 1,500 persons below, in one mine, at one time, whose lives may be endangered by the ignorance or the stupidity of one man, we require inspectors who can enforce regulations, and explain why they enforce them. The Government of Nova Scotia should have a Chief Inspector of Mines, whose scientific and technical attainments should be beyond reproach. This man should appoint his assistants by rigid competitive provincial examination, such as would entirely eliminate the incompetent and raise the status of the inspectorate. Men of this calibre would need and could not be obtained without the payment of adequate salaries, but in return, we would get adequate men, and it would open up an avenue of promotion for the young and ambitious mining students of the province. The Inspector of Mines should bear the same relation to the colilery manager that the colilery manager bears to his overmen, and the correspondingly more difficult than the colliery manager examination.

As conditions are now, the managers and salaried officials of the coal corporations are men whose wide range of experience and technical knowledge obtained by years of hard study, make them infinitely better able to advise the inspectors than the inspectors are to advise them, which is a reversal of the correct state of affairs. We think it will be found that most of the recent improvements in Cape Breton mining as regards safety—and they are many—have been carried out at the sole initiative of the officials of the coal corporations, who constitute the only body of mining experts in the province.

We have before pointed out in these columns that the mines of Nova Scotia produce more coal with fewer accidents than any mines in the world, and this is not altogether due to naturally safe conditions of mining. It is due to the application of modern mining methods and a consistent regard for anything that will tend to make the mines safer. These conservative methods have not been forced on the operators, who have carried them out, because they thought they were necessary, in many cases at a much increased mining cost. But we think the mine operators of Nova Scotia would welcome the appointment of inspectors of the type we have outlined, and we have yet to find them opposing anything in the nature of progress or safer conditions of mining.

The Commission that was appointed by the Nova Scotia Government to consider the present status of the colliery relief societies and the possibilities of an Old Age Pension Scheme for Nova Scotia have presented their report. The Commission cannot see their way to recommend the adoption of an Old Age Pension Schemes for all workmen in the province, for the reason that the finances of the province could not bear the strain, but they recommend old age pensions for miners, stating that "coal mining may be considered one of the extra hazardous employments not offering to the mass of the employed, much chance for advancement and from the nature of its predisposing to premature disease and consequent disability." The Commission recommend the formation of the Nova Scotia Colliery Workers' Provident Society, which shall be an amalgamation of the existing Relief Societies. The Commission point out the many disadvantages that arise from the present independent action of the Relief Societies, as for instance, the indigence of one society and the

possible bankruptcy of another, compared with the affluence of other societies at newer and better favored collieries. The Commission make the following important comment. "Our investigations have disclosed that the medical men whose certificates are necessary before the claimants can come on the funds for sick benefits are more or less subject to claims that have no merit. None of the present societies have their own doctor, the one whose certificate is accepted being always in the employ of the claimant. Such a system, or the lack of it, can only have one result, namely, a strong tendency to waste the funds on unrighteous claims. This is a detail that might beworked out hereafter, but for the present we may suggest that in some of the mining districts there are societies, which might be grouped for the purpose of employing a medical man who would in no sense be the employee of the members. Further, the branches might employ a paid visitor for the purpose of investigating and keeping down unjust claims, after a medical certificate had been properly granted. Here the Commission have touched upon a very important point, one that we wish to allude to in considering the draft of a Workmen's Compensation Act submitted by Dr. Kendall.

The Commission suggest the formation of an Emergency Fund to be available in case of some extensive disaster. This they suggest should be formed by taking 10 per cent. of all surplus relief funds over $1,000, in the hands of societies, a per capita tax per annum from each member of 30 cents and a special grant of $2,000 from the Government. This fund would be permitted to grow by yearly accretion until it had reached $50,000, after which the widows of miners killed in their work should be allowed to share in the fund. After the fund reached $100,000, it is suggested the fund should take care of the children of miners killed, and that at that time the branch societies should be relieved of this burden.

The Commission further recommend the formation of a Pension Fund and total disability fund entirely distinct and separate from the relief fund. Contributions to these funds would be compulsory on all workmen and the employers, while the Government would contribute their quota. Further particulars can be gleaned from the report of the Commission, but enough can be said to show that they have thoroughly covered the ground and have made a sensible and comprehensive report, with recommendations of a practical character. We are convinced that no better scheme can be devised to meet the exigencies of colliery relief work, than one which distributes the onus over the royalty owner—in this case the Government—the mine operators and the mine operatives, the three classes most intimately concerned. This plan is working well in Germany, and although the recommendations of the Commission do not go so far as the elaborate organization of such a society as the German National Miners Provident Association, or the Knappschafts-Verein, yet they are in effect the same.

The Commission state they consider miners are entitled to Old Age Pensions because their occupation is extra hazardous and their work predisposes them to premature disease. We take exception to these statements. The miners are in line for Old Age Pensions, because their Relief Funds have formed the nucleus of such a fund, and Governments help those who help themselves and the Government. The work of a miner does not predispose him to premature disease. Unfortunately it is only within the past few months that the Government of Nova Scotia has awakened to the necessity of keeping vital statistics, and we cannot give any figures to prove this statement as it refers more particularly to Nova Scotia. But so far as we know the mines of Nova Scotia ocmpare favorably with those of the country, and it is now an acknowledged fact, that miners live longer than other laboring men, longer even than the farm laborer. They work in an atmosphere that is constantly renewed and it is an accepted fact, that for some reason or other coal dust acts as preventive of tuberculosis.

The fact is that the regular work of the miner in an atmosphere that many a woman worker in a factory would gladly welcome, the antiseptic effect of the coal dust, the constant ablutions rendered necessary by his work and the short hours that he works, added to the comparative luxury in which he is enabled to live, by the high wages he receives, render the miner more or less of a favored person among workingmen. In Cape Breton anyway, the "premature disease" he often suffers from, is superinduced by bad whiskey and exposure to the weather under its influence. We may say that we rather doubt the accuracy of the figures in the report that purport to record the number of old men working at the mines. At the same time any man working in Cape Breton over sixty, who has spent his life there, must either have wasted his substance or have been the victim of financial misfortune.

The month of February was exceedingly mild, and delays from weather were very slight. For days the temperature did not fall below forty degrees, and practically no snow fell during the month. The outputs of the Dominion Coal Company for the month, were in excess of any previous outputs for February, reaching the record figure of 285,000 tons. This is over 60,000 tons ahead of February outputs in 1907. The Hub output was over 6,000 tons, the largest since the fire, and the Emery mine No. 10, produced 11,364 tons. This latter mine is now averaging nearly 500 tons per day.

The Conciliation Board began their deliberations on the 2nd March, with an all day session. The chairman of the Board, Prof. Adam Shortt, is a hard worker, and is losing no time in getting at the facts. On the 3rd the Board accompanied by representatives of the men and the company's officers inspected the workings of No. 2 Colliery. They put in six hours in the mine, and afterwards renewed their conferences. If this is the way Conciliation Boards work, we should soon see results. Prof. Shortt is evidently a hustler, and he makes an excellent chairman. The local paper is very indignant that newspaper reports of the proceedings are not to be allowed, and they refer to Prof. Shortt's ruling as "Star Chamber methods." We understand it is the policy of the Government not to take evidence formally at those Conciliation Board metings, and we think their policy is founded on good sense. Formal evidence taking necessitates the presence of a stenographer, and gives the Board meetings too much of the formal air of a court house, and does not conduce to free discussion and open language. Men are apt to unduly measure their words, when they know that some "chiel is present takkin notes" and they do not ventilate their opinions as they would were no stenographer present. Further, we do not know that the general public are interested in the proceedings of th Board. What they are interested in is the finding of the Board, and expressions of public opinion, while the case is under review do not help matters. We think Prof. Shortt is right and the "Glace Bay Gazette" is wrong.

Dr. Kendall has again introduced his Workmen's Compensation Act before the Nova Scotia local assembly. The bill is the same as submitted last year, and is in effect a copy of the British Workmen's Compensation Act, of 1897, with some definitions and amendments that subsequent litigation in England have rendered advisable to properly convey the spirit of the Bill. It is difficult to see what action the Nova Scotia Government can take on this bill, seeing that they are practically committed to an Old Age Pension Scheme and a consolidation of the Colliery Relief Funds. The two things could not exist side by side. We believe that the recommendations of the Old Age Commission are in the right direction, and promise to evolve a national society that will be of real benefit to all concerned. The Workmen's Compensation Act is not a success in England. It is pauperising the working classes, it is driving capital out of the country, it is destroying the friendly societies that were once the stay of the workers, and is recoiling upon those it

was intended to benefit. The gravest flaw in the British Compensation Act, and consequently in the proposed provincial act is its unfair distribution of responsibility. It places all the onus and all the responsibility on the employer, and gives the employee a free rein. More could be said on this matter, and we purpose returning to it. But we think Dr. Kendall's measure is put out of court by the proposals of the Government as to old age pensions and colliery relief. No colliery company could make contributions to a relief society were a Compensation Act to be put in force.

ONTARIO.

COBALT.

A number of the Cobalt members of the Canadian Mining Institute went down to Ottawa for the meeting. On the way down they inspected the smelter at Trout Mills, near North Bay.

The following were the shippers for the month of February:—

	Tons.
O'Brien	257.83
McKinley-Darragh	193.20
T. H. & B.	129.00
Nipissing	127.82
La Rose	72.05
Buffalo	63.67
King Edward	61.93
Trethewey	57.54
City of Cobalt	50.00
Drummond	46.17
Coniagas	32.72
Cobalt Lake	32.45
Temiskaming	28.12
Kerr Lake	21.30

Making a total of 1,173 tons for the month. This is 270 tons more than for the same month last year. The total shipments from January 1st to March 1st, were 2,599 tons, being 716 tons more than for the same period of 1907.

Badger Mine.—The shaft on the No. 9 vein is now down 90 feet. The vein is nine inches in width, carrying smaltite and native silver.

City of Cobalt.—Four inches of very rich ore has been met with in the shaft at a depth of 156 feet.

Cobalt Lake.—This company has shipped a car of ore to the Anglo-French Nickel Company, at Swansea. They are paid for the cobalt contents only. The ore will go over 14 per cent. arsenic, 10 per cent. nickel and about 80 ounces silver.

Right of Way.—Drifting north, form the 150-foot level of the No. 2 shaft, has been started, to conect with No. 1 shaft. There is about 175 feet more of driving to be done to conect the two shafts at the 75-foot level.

The new vein, cut in cross cutting from the No. 1 shaft, is practically all niccolite with native silver.

Coniagas.—Two cars a month, of ore and concentrates, are being shipped regularly from this mine.

T. H. & B.—The cross cut north is now over 300 feet in length. It should cut the big cobalt vein in another 85 feet.

The ore in No. 2 level East, is looking very well. The shaft is down 130 feet.

Four cars of ore were shipped in February. The last returns gave between 47 and 48 thousand dollars for one car and four are expected to be equally rich.

Little Nipissing.—Nearly a carload of ore is ready for shipment. This is all ore taken from the new find on the ground leased from the Peterson Lake Company. It is smaltite and native silver.

Victoria.—Captain Harris, late of the McKinley-Darragh, is in charge of operations here now.

Red Rock.—Mr. R. W. Thomson has taken charge of the work here. He is a Canadian, who has been mining on the Rand for some years.

Kerr Lake Crown Reserve.—Seven tons of ore were shipped by express to New Jersey, for treatment. It is expected that $50,000 will be realized from this shipment as it was specially selected. On the night of the 29th of February, the ore house was broken into, and about $1,000 worth of rich ore stolen. The men who took it were arrested a few days later, and the ore recovered, together with a sack of ore stolen from the Silver Queen. The men were sentenced to one and a half years in the Central Prison.

In going east in the cut, at a depth of 40 feet, what is probably the richest showing ever made in this camp, was met with. The vein here is 25 inches in width, calcite, smaltite, native silver and a little niccolite. Nipissing "49" in all its glory was hardly equal to this. There is nothing in the camp that can compare with the present showing. The vein is thought to be the extension of the Kerr Lake big vein. This find is close to the Silver Leaf line. These latter people are sinking on the same vein.

Silver Cross.—No. 2 shaft is now down 60 feet. At a depth of 50 feet a new vein was encountered, which at the bottom of the shaft shows stronger and carries higher values. The main vein sunk upon, is here 7 inches wide, calcite and smaltite. The work of the past three weeks, 40 feet of sinking, has wonderfully improved this property.

It is expected that the concentrator on the Nipissing will start this week. This is a dry process and the results will be watched with much interest.

LARDER LAKE DISTRICT.—Little work is being done up here just at present. The Reddick expect to set up their twenty stamp mill as soon as milder weather sets in. It is on the ground now. A test of four tons, taken from the dump, was made a short time ago. This lot was run through a three stamp mill and gave results of ten dollars a ton. This is considered an average of the 1,000 tons now on the dump. There are three shafts sunk on this property, 20, 40 and 60 feet deep, respectively.

On the Maxwell-Harris property there is a ten stamp mill, and it is expected that milling will start very shortly.

Lorrain Township.—A rich find of native silver has been made in the unsurveyed portion of this township. When the samples were brought into Haileybury it caused quite a stampede. The samples show smaltite and wire silver. The vein is four inches in width, and has been opened up for some distance. It is stated that the find is in the Keewatin.

Montreal River.—Preparations for extensive development work in the spring are being made, and supplies and equipment are being sent in. Of all the claims passes by the inspector, up to date, 160 of these were passed on native silver showings.

Rib Lake.—In the Harris mine, 16 feet of clean pyrite has been met with in cross cutting. This new ore body runs parallel to that now being worked.

ALBERTA.

EDMONTON.

When the Compensation Act came up in the House for its final reading, there were a number of amendments. The compensation to dependents in case of fatal accident was raised from $1,500 to $1,800, and in the clause providing that a workman should not receive compensation for injuries sustained while at work on a building less than 40 feet high, the 40 feet limit was altered to 30 feet.

The Socialist element in the labor ranks is not at all satisfied with the bill; the reason, probably being that it will remove a grievance and thus give the agitator less chance to enlarge on the sufferings of the workman..

The majority of the Labor men and especially the leaders in the miners' union are well pleased with the Act.

During the debate on the Compensation Act, the privilege of a seat on the floor of the House was accorded by the House to any labor delegate whom any member would care to have beside him to aid him. Mr. Simmons, the member for Lethbridge asked that Mr. Frank Sherman president of District 18 U. M. W of America, as representative of one of the largest labor unions in the country, be permitted to take a seat beside any of the members in the House.

The Socilistic element, as already stated, is against the Act, and at a meeting held in Edmonton adopted the following resolution:—

Whereas, the principle of compensation to workmen for injuries received in industrial pursuits is admitted in all civilized countries, and

Whereas, that 40 foot clause and other exemptions strike at the basic principle of compensation, and

Whereas the amount of compensation re weekly payment and death benefit is entirely inadequate, and

Whereas, the experience of Great Britain in the working out of compensation, despite the existence of the most perfect friendly society machinery in the world, has proven the impracticability of schemes in which contributions are made by the employees has caused the gradual elimination of this feature, and

Whereas, this meeting believes that the only sound, economic and just principle for compensation is payment for the injury through the employer who makes insurance an item in the cost of the manufacturer of the commodity in which he trades.

This meeting hereby places itself on record as being opposed to any compensation act passed in disregard of these facts.

Mr. F. H. Sherman, of Taber, president of District 18 of the United Mine Workers of America, interviewed in Edmonton, stated:—

"The Alberta Government has redeemed its promise to the coal miners, although we would have liked to have gone somewhat further.

"On behalf of the United Mine Workers of America, the largest body of organized labor in this province, I desire to say that the labor legislation passed at this session of the Legislature, while not all that we have hoped for, is a great improvement on the old conditions. We believe this legislation to be an honest attempt to place the wage earners of this province upon an equal footing with the workers of other provinces in the Dominion. However, this legislation, while good so far it goes, cannot settle the question of labor and capital. We accept these new laws only as an instalment of what is due to the workers of this country.

"We desire to thank the entire Legislature for their unfailing courtesy to our representatives and for the considerate treatment we have received at their hands.

"The passing of the Eigh Hours Bill will remove what has long been a bone of contention between us and our employers in this province, and therefore will tend in the direction of industrial peace.

"The Workmen's Compensation Act will result in greater care being taken for the protection of the lives and limbs of the wage earners, and, after all, that is what we require, for you cannot give adequate compensation to the widow and orphans for the loss of their bread winner, nor to a worker for the loss of his limbs.

"The Compensation Act places a value on the lives of our workmen, and we know from experience that steps wil lbe taken by employers of labor to safeguard them."

Lewis Stockett, general manager Bankhead Mines, Limited, and O. E. S. Whiteside, general manager of the International Coal & Coke Company, interviewed the Cabinet on behalf of the Western Coal Operators' Association, with the object of obtaining certain amendments to the Compensation Act and the Eight Hours Bill. They wished to have a clause inserted in the Compensation Act whereby the dependents of a man killed or permanently disabled could not obtain compensation if it could be proved that such man's injury or death was due to his own negligence.

In the Eight Hours Bill they wished several changes made. They want a clause inserted in the bill permitting a mine owner or operator to work his mine not exceeding 60 days in any one calendar year, for one hour per day more than the bill calls for. They claim it would be an advantage to the miners and the public that mines producing domestic coal especially be allowed to work for a longer period during the winter season. The operators also wish a clause making the hours for the men engaged in the handling and transportation of the coal eight hours at their working place. They claim this would work no hardship on these men for the reason that they are not continuously engaged in hard work, as the miner is at the face, and also that they are not exposed to the same danger as the miner. It is also claimed that a great many of these men are drivers, and drive horses and mules and it is necessary that these horses and mules have a lunch hour as well as the men, so that the men and the animals can be fed and watered.

In the case of contract miners they can have their lunch while waiting for shots to be fired or at any other time whenever they have a few minutes to spare, and often in the case of the mine drivers they can eat their lunch while riding on their cars.

The report of the Public Works Department laid on the table of the House shows that the coal production for 1907 in the Province of Alberta exceeded all previous records, amounting to no less than 1,800,000 tons.

Thirty-five new mines were opened and ninety-seven were in operation during the year. Six mines were abandoned and two closed mines were re-opened. In the mines there were 105 accidnts, some of these being very slight. Out of these 105 accidents there were 17 fatal accidents inside and two fatal accidents outside mines, and 18 accidents resulting in serious injury. There were 3,500 persons employed in the mines.

STRATHCONA.

The King has allowed Margaret Jane Lamb, of Newcastle-on-Tyne, Eng., the Edward Medal of the first class in recognition of the gallantry of her brother G. H. Lamb, who lost his life in an endeavor to save the life of the men in the Strathcona Company's mine at Strathcona. The medal presented to Miss Lamb is the second awarded by the King, who founded the medal in 1907 in recognition of the bravery of miners.

The King personally presented the first medal to the recipient.

LETHBRIDGE.

The Public Accounts Committee of the Federal Government at Ottawa investigated the attempt of F. C. Coldwell to obtain 75,200 acres of coal lands near Lethbridge. The regulations up to March last year forbade the acquiring of more than 320 acres by one person from the Department. Coldwell, in March, 1906, sent in 235 applications over the names of different persons, accompanied by a bulk cheque for the necessary $5 fees. Though the Department does not issue forms, many of these were on printed forms and the signatures very vague, many only having the initials of the Christian names and some only having surnames.

Forty-seven applicants were women. Many were chamber maids and bell boys in the Russell House, Ottawa.

The purport of the examination was to ascertain what precautions were taken by the Department. H. H. Rowan, the present head of the Mines Branch of the Department, explained that it was not the business of the Department to scrutinize the applications until called upon to issue patents, when steps would be taken to identify the applicants and make sure of their good faith.

Only ten of the applications were granted.

DIAMOND CITY.

Development work at the mines has been proceeding rapidly all winter, but has been temporarily stopped. The building operations in connection with the surface plant have also stopped, all the available brick being used up. The Diamond Coal Company manufactures its own brick from an excellent clay deposit on the property, and as all the bricks made last summer have been used, building operations will cease till spring opens up and new kilns of bricks can be burned.

BRITISH COLUMBIA.

THE KOOTENAYS.

Mining in Rossland is taking on a little brighter aspect at present than it has experienced for some months back. A rich ore shoot carrying gold from $17 to $40 per ton has been cut on the 1,650 foot level of the Le Roi mine. This is encouraging in the face of the fact that the values on the 1,650 foot level so far have been rather low. As to whether this new strike will prove to be extensive, that will depend on future development work, but the company has been working in the ore for a couple of weeks. The ore is of a pyritic character and where the quartz is mixed with it the gold values run high. At the same time there is an excess of iron over silica.

Shareholders of Le Roi 2 Company have been informed by cable that they are to receive another dividend of two shillings per share. The Blue Bird, Red Eagle and Homestake properties have been leased in the South Belt and several others are covered by options. The coming summer will see much activity in this section. It is to be hoped that the lessees will strike something good and prove up this part of the camp. They have some good ore in sight, averaging $50 to the ton.

Rossland will receive at least $3,000 of the 2 per cent. tax as its share this year, but will make an effort to get more. It is claimed that the city should receive $20,000 of this tax per annum. Owing to the Government taxing the mines which are in the city limits the corporation of the city of Rossland cannot collect from them.

The following tonnage was shipped from the camp during the week ended March 3rd:—

	Tons.
Centre Star, Cons.	3,180
Le Roi	1,249
Le Roi 2	770
Evening Star	30
Total	5,229

At the Trail smelter during the same week 4,708 tons of ore were received, not including the ore received from Rossland mines. The St. Eugene sent 398 tons, War Eagle 174, North Star 68, Vancouver 20 and many other smaller lots.

The Consolidated Mining & Smelting Company of Canada has issued a statement to the stockholders of operations for the period from July 1st to December 31st, 1907. The following were the shipments from the three mines:—

Centre Star group, Rossland	87,451 tons	(gold-copper)
St. Eugene group, Moyie	75,104 tons	(silver-lead)
Snowshoe group, Phoenix	86,109 tons	(copper-gold)
Total	248,664 tons	

The St. Eugene produced 12,110 tons of silver-lead concentrates. The average amount of ore received at Trail smelter was 1,116 tons per day. Amount of lead-silver bullion produced was 42 tons per day, valued at $165 per ton; copper matte 14.8 tons at $453 per ton; pig lead 38.4 tons, value $97 per ton. The gross value of the output for the year will approximate $6,000,000. The ore reserves in the mines are looking very well. Another recent shipment of 120 tons of ore from the lower workings of the War Eagle at Rossland carried $40 per ton in gold. The ore recently encountered in the Le Roi is of the same appearance and character as that found in the lower depths of the War Eagle.

While the Granby profits have closely approached the disappearing line with the recent fall in copper, they are yet actively pursuing mining and smelting operations, and in fact have broken a couple of their former time records. The smelter treated 3,450 tons of ore in 24 hours a week ago and for the week ended February 29th thy exceeded all former records and shipped 22,938 tons from mines to smelter. The total ore shipments for the year so far have been 146,947 tons. The smelter treated 22,545 tons during the above week, making 146,673 tons for the year to that date. The pay roll at the Granby mines is $50,000 per month, and there are 340 men working around the smelter at Grand Forks, the pay roll averaging $30,000 per month.

The Boundary mines shipped during the year 1907 a tonnage of 29,423,856 as against 30,375,924 tons for the calendar year 1906. The hours of work at the Granby mines have been changed to conform with the law and hereafter the eight hour shifts will begin at 8 a.m., 4 p.m. and midnight, instead of an hour earlier as heretofore.

The Snowshoe and other Boundary copper mines have made no move to resume operation, and it is not likely that they will do so until copper makes an advance of two or three cents per pound.

The new 500 horse-power motor and part of the new Rand tandem, compound, duplex, Corliss, 3,474 foot air compressor which is will drive have arirved at the British Columbia Copper Company's mine, and will be in readiness to operate when work is resumed.

The Crescent Mining Company, a Chicago enterprise, shipped a 20 ton car of high grade ore last week. This ore is being stoped from the 225 foot level and it is expected will return the company about $100 per ton. The electrical plant is working well. A shaft is being driven on the Tip Top, another high grade property, and is now down 100 feet.

A small force of men are working on the Maple Leaf group in Franklin camp. If the propery turns out well and the $125,000 bond is taken up by the New York Company it is understood that a merger will be attempted and other important Franklin camp properties secured. In case this was done a smelter would be built at Franklin, as the ores are low grade and a lot of the profit is eaten up by hauling to distant smelters.

Getting out railway ties furnished employment to over 400 men in the Boundary this winter. In the local camps over 400,000 were made, which at 30 cents a piece means the distribution of $120,000 among local interests.

At the Nickle Plate mine of the Daly Reduction Company, Hedley, over 140 men are now employed. The company did not experience any friction when the wage scale was lowered all over the district, and their miners are now receiving $3.50 for eight hours, the same as is paid in the Boundary and elsewhere. The company has 110 stamps dropping in its mill at Hedley and is shipping high grade concentrates. Nickel Plate ore carries $80 per ton in gold and silver.

A strike of good gold ore in new ground has been made at the Queen mine, Salmo. The ore was opened up at the bottom of a shaft 80 feet below the fourth level of the mine. The ore in the bottom is six feet wide, while the ledge higher up the hill is only four feet in width. Manager Waldie has completed the installation of his new 10 stamp mill, which now gives him twenty stamps

altogether. A new Jenckes hoist and a Rand air compressor are on the way to the mine and will be installed before the snow disappears. The Nugget, Mother Lode and Kootenay Belle are all shipping a small tonnage regularly. The Fern mine is being operated.

The Hewitt Mining Company has shipped another car of silver-lead ore carrying 185 ounces silver and 7.5 per cent. lead.

The Krao mine, which was floated at Butte last year with a capital of $600,000, may be consolidated with adjoining Ainsworth properties and capitalized for $2,000,000. Meantime, it will be necessary to run a long tunnel to tap the ore bodies at depth, owing to the inflow of water in the shaft workings.

The Westmount mine has shipped a car of pyritic ore carrying 300 ounces of silver. This high value of silver in the iron pyritic ore has proved something of a surprise to mining men in that section, and it is stated that the prospectors will not overlook pyritic showings this coming season.

The output of the Ferguson Mines Company for the year 1907 averaged 150 tons per month, valued at $140 per ton in gold, silver and lead.

If the copper and timber markets pick up a little within the next few months British Columbia will experience a year of splendid prosperity. What with the heavy expenditures that will be made in connection with work on the Grand Trunk Pacific, Canadian Pacific and Great Northern and the mining industry looking very good, considering the present state of affairs, the people of this province should enjoy a prosperous year.

GENERAL MINING NEWS

NOVA SCOTIA.

GLACE BAY.—Shortly after noon on March 8th the coal washer of the Dominion Coal Company at Port Morien was completely destroyed by fire. The loss will reach about $100,000. Considerable coal was also lost. This is the second fire within two years. Sixty thousand tons of coal monthly was the working capacity of the plant, about fifty thousand of which were shipped to the Everett Gas & Coke Company, near Boston.

SYDNEY.—The Dominion Iron & Steel Company at No. 2 slope, Wabana, Newfoundland, on Friday, February 28, broke all previous records in hoisting thirteen hundred tons of ore from a single slope. This record for an iron ore mine is said to be unprecented in America.

HALIFAX.—It was announced on Wednesday, March 4th, that Mr. Graham Fraser, popularly termed "the father of the iron and steel industry in Nova Scotia," had been elected a director of the Dominion Coal Company, to fill the vacancy created by the resignation of Senator David McKeen. The other Nova Scotian on the Board is Mr. W. B. Ross, K.C., of Halifax.

BRITISH COLUMBIA.

NELSON.—For the week ended February 22nd a larger number of mines, including some new producers, have made shipments. Both the British Columbia Copper and the Dominion Copper are still shut down; but the Granby is putting out a record tonnage at mine and smelter. At Rossland the Centre Star is increasing its tonnage; but Le Roi is limiting itself to about 1,500 tons. The Westmount, a new Slocan mine about 10 miles from Slocan city, made a shipment of one car of rich silver ore in which iron pyrites is associated with the silver bearing minerals.

ROSSLAND.—The Red Eagle mine has been leased by Dr. D. E. Kerr and N. Smith to Richard Hooper, Martin Daly and Samuel Lynn for a year and a half.

VICTORIA.—The bill now before the British Columbia Legislature to amend the Placer Mining Act fixes the size of placer claims in creek diggings at 250 feet in the general course of the stream and 1,000 feet in width, measurement from the general course of the stream 500 feet on either side of the centre thereof. Bar diggings are fixed at 250 feet square on any bar covered at high water, or a strip of land 250 long at high water mark from high water mark to low water mark. Dry diggings to be 250 feet square.

The bill authorizing a loan of $10,000 to the Canada Zinc Company was read a third time and passed, the Premier stating, in reply to Mr. Hawthornthwaite, that the operation of the process would be watched by an officer of the Government on its behalf.

PHOENIX.—The new Boundary shipper, the Crescent mine, will ship one or two cars of gold-silver ore per month. The shipping ore is stoped from the 250 foot level. Only a dozen men are employed.

NELSON.—For the week ending February 29th the Granby mines shipped the largest amount of the year—22,919 tons of ore as compared with 17,147 tons during the previous week. The Granby smelter treated 22,546 tons, also a record.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

The bill to amend the Coal Mines Regulation Acts by limiting the hours of work underground to eight was introduced in the House of Commons by Mr. Herbert Gladstone on February 20th and read a first time.

The King Edward medal, instituted as a reward for gallant conduct in saving or attempting to save life in mines was personally presented by King Edward on February 27th to Francis Chandler and Wm. Everson. Miss Margaret J. Lamb, a resident of Newcastle-on-Tyne, also received the medal as a recognition of the bravery of her brother, G. H. Lamb, who lost his life in an attempt to save the lives of comrades in the Sthrathcona mine, British Columbia.

NORWAY.

The Hohenloche-Werke-Akbiengesselschaft, a German company, have acquired extensive deposits of zincblende and galena in Norde Hakedal and Nannestad at a price of about £61,000.

The Hassel iron mines, which have not been in operation for more than century, are to be reopened by a company which is be-

ing organized with £47,000 capital. The ore will be smelted with charcoal obtained from the waste wood of the neighboring forests and saw mills.

GERMANY.

The Prussian Government, which operates in all 39 mines of various minerals, and numerous metal works, realized a surplus of £1,372,242 on the year's operations for 1906. These industries employ 89,130 men.

A noteworthy paper was read by Mr. A. Haarmann, of Osnabruck, a leading German railway authority, at the last meeting of the society of German Ironmasters at Dusseldorf, in which he expressed the opinion that iron should take the place of wood as material for railway sleepers. He submitted figures to show that in iron-producing countries the wooden sleeper cost at least 85 per cent. more than the iron sleeper.

An expendition which since last July has been prospecting for phosphates in the German Islands in the South seas has found deposits on several islands, those of Fais, of the West Carolines and Angauer in the Palan group being especially rich.

RUSSIA.

Dredging for gold in the Ural and the Enisseysk mining district has proved a failure. Of 50 dredges working in Russia only four or five have yielded a profit.

Extensive deposits of quartz and placer gold have been discovered along the Peitcha river in Ussuri province, but prospecting and work have been interfered with by Chinese robbers.

The coal basin of Kussnetska, Western Siberia, where as much as 250,000,000 poods of coal are in sight, will shortly be connected with the Siberian Railway.

AUSTRALASIA.

At the Mount Lyell copper mine, Tasmania, boring at the 1,000 foot level has shown the downward continuation of one of the shoots worked at the 850 foot level and largely increased the estimate of the ore reserves.

The mineral yield of New South Wales for 1907 is a record one, being valued at £10,577,378 as compared with £8,169,625 in 1906. The number of persons employed in mineral production was 43,758.

The gold output of New Zealand for January last amounted to 59,072 ounces, valued at £231,508, as against 27,510 ounces, value £107,117, for January, 1907.

INDIA.

The development of the manganese industry in the Central Provinces has been very rapid, especially in the Balaghat district, from which about 21,000 tons were shipped in 1904-5. During the year ending June 30, 1906, the shipments were over 50,300 tons, and the quantity has since been steadily increasing.

SOUTH AFRICA.

The Transvaal Chamber of Mines has instituted a competition in rock drills. Manufacturers are asked to send out from six to nine drills to work under ordinary mining conditions for a period of from four to five months under the supervision of a committee. The prizes for the manufacturers is to be £4,000 and £1,000, and to the operators not less than £250. The trials are to commence January 1st, 1909.

The net gain in the number of native laborers employed in the Transvaal mines during January was 11,914, the total number employed at the end of the month being 118,204.

Several amalgamations of Rand mining properties are being negotiated with a view to economy in operation. The consolidation of the Klipriversberg Estate and several other concerns, if ecected, will place 1,085 mining claims under one management.

A copper proposition some 18 miles northwest of Upington, Cape Colony, 45,000 acres in extent, is being opened up by Mr. W. Bleloch and his associates.

UNITED STATES.

The Wayne Iron Company has acquired 600 acres in Wayne county, New York, which it is estimated will produce from 3,500,000 to 4,000,000 tons of iron ore. They expect to get out about 1,000 tons a day, which will be placed on the market this season. The property is about 75 miles from Buffalo.

A law goes into effect in Indiana May 1st prohibiting railroad companies from owning coal mines and coal lands in the State. A big combine in which railway magnates are prominent is being formed to take over the coal mining properties.

Work has been resumed in the mines of the Amalgamated Copper Company, Butte Coalition, and North Butte Companies at Butte, Mont., which have for some time been idle. It will be about four months before any copper can be produced for the market.

MEXICO.

An explosion recently took place in the La Rosita coal mine of the Sabines Coal Company at Sabines, Coahuila, by which about 100 miners, Japanese and Mexicans, were killed. Fire damp is believed to have been the cause.

Mr. Frank G. Stevens, representing Canadian and British capitalists, has purchased mines in the Hostotipaquillo district, Quadalajara, from Carlos Romero. Mr. Stevens will devote his attention to operating the properties, which include the Mololoa mine, one of the oldest in the district.

Mr. J. W. Bryant, representing the Tyee Copper Company of British Columbia is in Mexico in connection with a project for procuring Mexican ores for smelting in British Columbia.

The famous Calumet and Hecla mine, which has just sliced its quarterly dividend from $15 to $5, has paid out $107,350,000 in dividends since its inception.

The stock a year ago sold as high as $1 a share, but yesterday was down as low as 601, breaking 49 points on the declaration of the dividend.

In 1903 the stock was as low as 384.

The mine's dividend record since 1900 is as follows:—

Year.	Per share.	Amount.
1900	$75	$7,500,000
1901	45	4,500,000
1902	25	2,500,000
1903	35	3,500,000
1904	40	4,000,000
1905	50	5,000,000
1906	70	7,000,000
1907	65	6,500,000
1908	15	1,500,000

COMPANY REPORTS.

DOMINION COAL COMPANY, LIMITED.

Report of Directors for year ending December 31st, 1907.

Company's Operations.

The output for 1907 was 3,541,253 tons, as compared with 3,552,746 tons for 1906, or 11,493 tons less than in the corresponding period. The decrease was due to the fact that mining operations had not been resumed at No. 7 mine since the fire which occurred in December, 1906. The business of the company has been adversely affected by the following circumstances:—

The weather experienced throughout the winter and the spring was abnormally severe, thereby delaying the opening of navigation at Sydney by about four weeks, and owing to the presence of drift ice along the Nova Scotia coat and in the Gulf, the regular shipments to the St. Lawrence did not begin until June 6th. These unusual conditions rendered it impossible to get up the full quantity of coal required for St. Lawrence points during the season of open navigation; supplementary shipments had to be made via Portland, Maine, after the closing of the river, entailing heavy additional cost of railway carriage from that port to Montreal. The delays to steamers also caused an increase in the freighting costs.

Mining costs have continued to increase greatly, by reason of the scarcity of labor, the irregular working of men and the high prices paid for all materials used at the mines, including hay and feed for the horses; these conditions were the most unfavorable in the history of the company.

Company's Property.

No. 7 mine was idle nearly all the year on account of the fire as above noted, which destroyed the bankhead and all surface works, and necessitated the flooding of the mine from the ocean. The flooding was stopped on January 29th, 1907, and pumping out commenced immediately after; the first coal was hoisted on November 27th. All surface works have been replaced and are now in first-class order, and the mine in condition to give a normal output next season.

New Works.—One of the new mines (No. 12) referred to in the last annual report, has been opened in the Lingan-Victoria district. The main slope has been driven 390 feet, and the back deep 335 feet, and first levels have been broken off. The prospects in this district show great promise and when fully developed the new colliery will produce a substantial output. The construction of the branch line (about seven miles in length) connnecting this district with the main line of the company's railway, has been commenced. The bush has been cleared for four miles and grading completed for two miles. Some 368 acres of land have been purchased for the surface works, town site and reservoir, and the necessary clearing has been completed to a sufficient extent to admit of the erection of the temporary mine buildings, boarding houses and stables.

Following the policy already established by your directors to safeguard in every possible manner life and property, careful attention has been paid to the prevention of fires both for underground and surface works. All collieries are periodically inspected by a special fire inspection committee, and regularly drilled fire brigades are organized at each of the collieries. Safety lamps are now in us at all mines.

A rescue station at a central point with full equipment has been established, including twenty sets of "Draeger Breathing Apparatus," to enable men in any emergency to work in a poisonous atmosphere. A volunteer corps for such service has been organed and the men have been drilled in the use of the apparatus by a competent instructor brought over from England.

A horse hospital has been erected, in which the sick and injured mine horses are properly treated with satisfactory results.

Wrecking Plant.—In response to the invitation of the Federal Government to tender for the establishment of a wrecking plant to afford aid to wrecked, disabled or stranded vessels within the coastal waters of the Maritime Provinces and the Gulf of St. Lawrence, an offer was submitted by the company which was accepted, and an agreement entered into for five years. Certain of the company's steamers have been assigned to this duty and a complete outfit purchased. During the eight months of its existence assistance has been rendered to eleven vessels.

New Coast Steamer.—Owing to the great difficulty experienced in obtaining schooners to carry on the coastwise trade, a specially designed steamer was built in Scotland to the company's order. This steamer, the "Cabot," arrived at Sydney on September 21st, and has been continuously employed in the trades since that date.

Loading Plant at Glace Bay Harbor.—A trestle and chute have been erected at this point to provide return cargoes for sailing craft coming in with lumber and produce, and the berth in this harbor dredged to enable vessels to lie alongside. These facilities have proved advantageous to the company.

Rolling Stock, Etc.—One new main line locomotive and one new bank-switching locomotive have been purchased during the year. Also one new steam shovel for the banking station. The capacity of the banking station has been increased by building new turn-out and trestle. Scales for weighing coal on cars have been installed in Nos. 1, 2 and 4 colliery yards. A new foot turntable has been erected at the Glace Bay round house.

New dwelling houses for miners were erected as follows:—No. 5 colliery, 29 houses; No. 4 colliery, 1 house; mechanics' row, 1 house; and one boarding house in No. 2 district, and construction started on one hundred additional houses at various places. A census was taken in October showing a total population of 10,600 persons occupying the company's houses.

A new bankhead to serve both Emery and Phalen seams at No. 5 colliery has been built and was put in operation on July 1st, replacing the old bankhead destroyed by fire in October, 1906. Also a new machine shope equipped with all necessary modern tools.

Electric Power Transmission.—The third unit has been installed at the central electric station at No. 2, and the use of electric power extended during the year by the installation of an electric underground haulage engine at No. 3 colliery, the introduction of electrically driven turbine pumps at several collieries, electric motors to run the central machine shop at Glace Bay and at No. 2 colliery, and the bankhead machinery at No. 5 and No. 7 collieries, and for hoisting tanks at No. 8 water shaft.

The company's property generally has been maintained in a state of efficiency and the development of the mines regularly carried on so as to insure the best possible results.

Company's Stores.—The management of the Commercial Stores, which was found to be most unsatisfactory, has been completely changed and the pernicious system of allowing long time and indiscriminate credits to workmen discontinued. A careful inventory of the goods in stock has been taken and loss for depreciation provided for.

General.

The suit taken against the company by the Dominion Iron & Steel Company, referred to in the last annual report, was tried at Sydney (July 30th to August 19th) before Mr. Justice Longley, and judgment given in the plaintiff's favor on September 15th. Your directors have throughout been acting upon the advice of eminent counsel, but after this reverse for their fuller satisfaction they took other counsel into consultation, who were unanimous in their opinion that the Coal Company's contentions were right and would eventually be maintained. The appeal taken

before the Supreme Court of Nova Scotia was heard at Halifax on December 17th, 1907, and a decision in favor of the Steel Company was given on January 14th, 1908. Since receiving this second adverse judgement, and in view of the appeal which has been taken to the Privy Council, your directors have submitted the case separately to three prominent members of the Ontario bar, and to two United States lawyers of high standing. In each case an entirely favorable opinion has been received, and your directors consider that the recent decisions should be reversed and judgment given in favor of this company.

Your directors regret that the annoyance and expense of a protracted litigation should continue to be borne by the company, but as no genuine response has up to the present been made by the Steel Company to the numerous overtures put forward from time to time by influential friends of the two companies for a settlement on fair and equitable lines, the only alternative would have been complete surrender to the Steel Company's unreasonable demands. The questions involved are so vital to the prosperity of this company and your directors' belief in the justice of the company's cause and its ultimate success in the suit being well assured, they have had no alternative in the best interests of the shareholders but to earnestly prosecute the appeal to the Privy Council.

Your directors, however, continue ready to discuss any feasible scheme of settlement offered by the Steel Company, recognizing that in view of the intimate relations which must inevitably exist between them, an amicable termination of the dispute would redound to the greater advantage of both companies.

Respectfully submitted,

JAMES ROSS, President.

PROFIT AND LOSS ACCOUNT.

For Year 1907.

Net proceeds from sale of coal and net income from steamships, railways, real estates, etc...		2,094,539.23
Less		
Interest on bonds	250,000.00	
Dividend on preferred stock	210,000.00	
Miscellaneous interest	32,171.13	
Dividend on common stock	600,000.00	
		1,092,171.13
		1,002,368.10

Certified correct,

W. S. ANDREWS, Auditor.

At the annual meeting of the British Columbia Copper Company, held recently in Charleston, W. Va., the president, Mr. Colgate Hoyt, asserted that the year ended November 30th, 1907, had been the hardest in the history of the company. The fuel famine of last spring, the recession of copper prices, and the shortage of cars were, according to Mr. Hoyt, the chief reasons for the trying times. The capacity of the excellently equipped smelter at Greenwood is 2,000 tons of ore per day, but during the past year the plant could only be operated at about one-half its capacity. The dividend of 40 cents per share paid last July had been made possible by high prices and continuous operations.

Had it been possible to get the price for the copper shipped at date of shipment, the net profits of the company would have been $396,534.30.

Two hundred and sixty-eight thousand two hundred and thirty-one tons of ore was mined on the company's own properties. The Lone Star and Washington property was purchased and paid for, the consideration being $75,000. Development work was performed at an outlay of $114,898. The mines and reduction works were closed in November pending a rise in copper.

The profit and loss account for the year ended November 30th, 1907, is as follows:—

Balance Dec. 1st, 1906	$231,022
Premium on stock sales	57,118
Adjustment account	21,724
Income for year ended Nov. 30, 1907.....	88,158
Total	$398,018
Expenses	20,777
Net	377,241
Dividends	201,200
Surplus	176,041

The directors re-elected include:—Copely Amory, Anthony N. Brady, C. H. Burke, Newman Erb, Colgate Hoyt, Edwin Hawley, B. B. Lawrence, J. C. Reiff, F. L. Sommer, C. A. Starbuck, and F. L. Underwood.

At the annual meeting of the Crow's Nest Pass Coal Company, held in Toronto March 10th, the following officers were elected:—Mr. G. G. S. Lindsey, President; Hon. Robert Jaffray, Vice-President; Sir Henry Pellatt, Second Vice-mresident; Mr. E. R. Wood, Treasurer; Col. W. P. Clough (New York), Mr. H. B. McGiverin (Ottawa), Mr. C. E. Whitney (Ottawa), Mr. Elias Rogers (Toronto) and Mr. Jay P. Graves (Spokane), directors. The report for 1907 was submitted, showing net profits for the year of $382,986.28, an increase of $31,195 over 1906. To this has been added $353,592.42, balance at credit of profit and loss brought forward from 1906, and $324,420 representing premiums on new stock, making a total of $1,060,998.70. From this amount four quarterly 2 1-2 per cent. dividends have taken $355,178.98, $324,420 has been transferred to reserve, and $381,309.72 has been carried forward to credit of profit and loss. The amount of coal mined in 1907 was 981,939 tons, as against 806,901 tons in 1906, and the production of coke was 231,368 tons, as against 213,295 in 1906. A strike of the miners in April, and the closing down of the smelters, materially lessened the company's output. During the year the company spent in improvements a total of $493,818.73. The report states that the costs of mining and coke-making in 1907 were increased greatly by reason of the advance in wages to miners, the irregular working of the men, the scarcity of labor, expense of securing new miners, higher prices of material, increase in freight rates, larger cost of compensation for injuries to workmen, and extremely servere weather during the first three months of the year. Besides, a fluctuating demand for coal involved pressing the mines at times for tonnage, which naturally raised the cost. These conditions were the most unfavorable in the history of the company.

The annual meeting of the shareholders of the Intercolonial tCoal Mining Company, Limited, took place recently at the office of the company, room 312 Merchants Bank Building.

The output of coal and coke for the year ending 31st December, 1907, amounted to 317,599 tons.

The following gentlemen were elected directors for the coming year: Messrs. James P. Cleghorn, W. M. Ramsay, A. W. Hooper, R. MacD. Paterson, K. W. Blackwell, E. Goff Penny and D. Forbes Angus.

At a subsequent meeting of the board, Mr. James P. Cleghorn was re-elected president, Mr. D. Forbes Angus was re-elected vice-president and managing director, and Mr. C. A. Dowd was appointed secretary-treasurer.

The Kerr Lake Mining Company has declared the regular dividend of 2 per cent. quarterly with a bonus of 1 per cent.

STATISTICS AND RETURNS.

PRELIMINARY REPORT ON THE MINERAL PRODUCTION OF CANADA IN 1907.

(Subject to Revision.)

METALLIC.

Product.	Quantity. (a)	Value. (b)
Antimony ore, tons	2,016	$ 65,000
Copper, lbs.	57,381,746	11,478,644
Gold—Yukon	$3,150,000	
Gold—All other	5,114,765	
		8,264,765
Iron ore (exports) (e), tons	25,901	45,907
Pig iron from Canadian ore (d) tons	107,599	1,982,307
Lead (e) lbs.	47,565,000	2,532,836
Nickel (f) lbs.	21,189,793	9,535,407
Silver (g) oz.	12,750,044	8,329,221
Cobalt, zinc, and other metallic products		200,000
Total metallic		42,434,087

NON-METALLIC.

Arsenic (refined) lbs.	660,080	36,210
Asbestos, short tons	62,018	2,482,984
Asbestic, short tons	28,519	22,059
Chromite, short tons	7,196	72,901
Coal, short tons	10,510,961	24,560,238
Peat, short tons	50	200
Corundum, short tons	1,892	177,922
Feldspar, short tons	12,584	29,809
Graphite, short tons	579	16,000
Grindstones, short tons	5,382	46,876
Gypsum, short tons	475,508	642,470
Limestone for flux in iron furnaces, short tons	359,503	298,097
Mica, short tons		333,022
Mineral pigments—Barytes, short tons	2,016	4,500
Mineral pigments—Ochres, short tons	5,828	35,570
Mineral water, galls.	250,985	110,524
Natural gas (h)		748,581
Petroleum (i), bbls.	788,872	1,057,088
Phosphate, tons	750	5,514
Pyrites, tons	39,133	189,353
Salt, tons	72,697	342,315
Talc, tons	1,534	4,602
Tripolite, tons	30	225
Total		31,217,060

STRUCTURAL MATERIALS AND CLAY PRODUCTS.

Cement, natural rock, bbls.	5,775	4,043
Cement, Portland, bbls.	2,368,593	3,374,828
Flagstones, square yards	3,000	2,550
Sands and gravels (exports) tons	298,095	119,853
Sewer pipe		1,211,000
Slate, squares	4,335	20,056
Building material, including bricks, building stone, lime, etc., estimated on the basis of production in 1906		7,500,000
Total structural materials and clay		12,232,330
Total all other non-metallic		31,217,060
Total non-mtallic		43,449,390
Total metallic		42,434,087
Estimated value of mineral products not returned		300,000
Total, 1907		86,183,477

(a) Quantity of product sold or shipped.

(b) The metals, copper, lead, nickel and silver, are, for statistical and comparative purposes, valued at the final average value of the refined metal in New York. Pig iron is valued at the furnace, and non-metallic products at the mine or point of shipment.

(c) Copper contents of ore, matte, etc., at 20.004 cents per pound.

(d) The total production of pig iron in Canada in 1907 was 651,962 short tons, valued at $9,125,226, of which it is estimated about 107,599 tons valued at $1,982,307 should be attributed to Canadian ore, and 544,363 tons, valued at $7,142,919 tons ore imported.

(e) Lead contents of ore matte, etc., at 5.325 cents per lb.

(f) Nickel contents of matte shipped at 45 cents per lb.

(g) Silver contents of ore, etc., at 65.327 cents per oz.

(h) Gross return from sale of gas. Additional returns increase this item to $803,908.

(i) Deduced from the amount paid in bounties and valued at $1.34 per barrel.

ANNUAL PRODUCTION SINCE 1886.

1886	10,221,255
1887	10,321,331
1888	12,518,894
1889	14,013,113
1900	16,763,353
1891	18,976,616
1892	16,623,415
1893	20,035,082
1894	19,931,158
1895	20,505,917
1896	22,474,256
1897	28,485,023
1898	38,412,431

1901	65,804,611
1902	63,211,634
1903	61,740,513
1904	60,073,897
1905	69,525,170
1906	79,057,308
1907	86,183,477

SUMMARY STATEMENT OF THE OUTPUT OF THE MINES IN THE PROVINCE OF QUEBEC FOR 1907.

(Courtesy of Mr. J. Obalski.)

Kind of Minerals. (Tons of 2,000 lbs.)	Wages paid.	No. of work-men.	Quantities shipped or used.	Gross value
Bog iron ore	28,974	100	22,681	80,231
Calcined ocre	20,197	75	2,300	29,430
Raw ocre			2,700	5,400
Chromic iron	31,801	76	6,407	63,130
Copper ore	103,884	250	29,574	160,455
Asbestos	915,081	2,081	61,833	2,441,919
Asbestic			29,193	27,293
Mica, trimmed (pounds)			559,247	199,848
Mica, untrimmed	100,600	275	91	13,660
Phosphate			408	3,410
Graphite	15,000	75	120	5,000
Magnesite			35	5,000
Slate (squares)	15,000	50	4,336	20,050

Flagstones (yards)	1,350	6	3,000	2,550
Cement (barrels)	170,000	350		640,000
Granite (cu. yds.)	238,761	653	51,873	560,236
Lime (bushels)	33,500	134	556,000	96,000
Bricks	300,000	1,462	94,000,000	525,000
Tiles and pottery				270,000
Limestone (cub. yds.) ..	155,882	515	97,710	223,580
	2,130,010	6,092		5,367,198

Note.—These figures do not include the value of the metal content of the ore, nor the pig iron and ferro-chrome manufactured in the province; nor do they include the natural gas. By adding these items the total value would be increased to $6,000,000 or $7,000,000. The figures above apply to prices paid at shipping points and have been compiled from the reports of operating companies. The figures are practically correct, but are subject to slight corrections.

ASBESTOS.

The production shipped, during the year of 1907, from the different districts of the province, is as follows:—

Tons of 2,000 lbs.	Tons.	Value.
1st class (crude)	1,485	$367,188
2nd class (crude)	2,888	456,073
Fibre	19,805	772,513
Paper stock	37,655	846,145
Total	61,833	2,441,919
Asbestic	29,193	27,293
Total value		$2,469,212

Two thousand and eighty-one workmen have been employed and $915,061 in wages were to them. They have worked the whole year in the principal mines.

MICA AND CHROME.

The production of mica shipped may be summed up as follows for 1907:—

	Lbs.	Value.
1-2 Thumb trimmed	204,276	$30,633
1-3 Thumb trimmed	139,240	34,891
2-3 Thumb trimmed	86,003	44,460
2-4 Thumb trimmed	71,852	49,235
3-5 Thumb trimmed	24,248	20,090
4-6 Thumb trimmed	12,597	13,083
5-8 Thumb trimmed	4,074	5,347
Total thumb trimmed ...	542,290	197,739
Split	7,957	2,109
	550,247	199,848
Crude mica having undergone a first classification, 91 1-2 tons (2,000 lbs. to a ton)		13,660
Total value		$213,508

The mica industry in the province has employed 275 workmen, of which 150 have worked on the mines and the others on the classification. The work has been done during the periods of 6 to 12 months, and a sum of $100,600 has been paid in wages.

The production of chrome for 1907 has been as follows (2,240 lb. tons):—

		Value.
1st class, in lumps	145	$ 1,925
2nd class, in lumps	3,536	33,485
Concentrated	2,040	27,720
Total	5,721	63,130

Corresponding to 6,407 tons of 2,000 lbs.

Seventy-six workmen were employed during periods of 4 to 11 months.

MINERAL OUTPUT OF ONTARIO FOR 1907.

METALLIC.

	Quantity.	Value.
Gold, ounces	3,810	66,399
Silver, ounces	10,005,749	6,155,166
Cobalt, tons	751	104,426
Nickel, tons	10,972	2,271,616
Copper, tons	7,373	1,045,511
Iron ore, tons	205,295	482,532
Pig iron, tons	286,216	4,716,857
		14,842,507
Less value Ontario iron ore (120,177 tons) smelted into pig iron		282,702
		$14,559,805

NON-METALLIC.

Arsenic, tons	3,712	$ 2,782

BRITISH COLUMBIA SHIPMENTS.

Following are the shipments for the week ending February 22nd and year to date:—

	Week.	Year.
Boundary shipments	17,514	123,048
Rossland shipments	4,958	43,875
Slocan-Kootenay shipments	2,725	20,953

The total shipments for the past week were 25,197, and for the year to date 187,876 tons.

Nelson, Feb. 29.—The total shipments from Boundary and Kootenay mines for the past week were 30,186 tons, the largest for the present year so far. The total for the year to date is 218,502 tons. The various districts produced as under:—

	Week.	Year.
Boundary	22,960	146,398
Rossland	4,924	48,799
East of Columbia river	2,302	23,305

Receipts af the various smelters were as follows:—Granby, week, 22,919; year, 145,967. Trail, week, 4,807; year, 45,438. Le Roi, week, 1,378; year, 14,790. Sullivan, week 675; year, 5,730. Total, week, 29,779; year, 211,925.

The output of the collieries of the Crow's Nest Pass Coal Company during the fourth week in February, for four years, compares as follows:

	Tons.	Daily aver.
1908	22,776	3,796
1907	22,262	3,710
1906	19,769	3,295
1905	18,113	3,019

	Week ending Mar. 7. Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo	.....	301,100
Coniagas	61,880	260,870
Cobalt Lake	.....	115,700
City Cobalt	.....	101,010
Drummond	.....	92,340
Foster	.....	168,600
Kerr Lake	61,700	144,290
King Edward	.....	127,240
La Rose	90,190	370,332
McKinley	.....	506,420
Nipissing	127,710	693,940
Nova Scotia	40,000	80,799
O'Brien	65,100	957,350
Standard	.....	39,730
Silver Queen	53,700	296,700
Silver Cliff	.....	52,000
Silver Leaf	.....	62,000
Townsite	.....	45,100
Temiskaming	.....	115,650
Temiskaming & H. B.	60,000	318,000
Trethewey	.....	177,116
Watts	.....	61,700

The total shipments for the week were 561,280 pounds, or 280 tons. The total shipments from January 1st to date, are 5,511,988 pounds, or 2,755 tons. The total shipments for the year 1907, were 28,081,010 pounds, or 14,040 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2,144 tons, valued at $1,473,196; in 1906, 5,129 tons, valued at $3,900,000.

The output of the Crow's Nest Pass collieries for the week ending March 6th, compares with the same week in previous years, as follows:—

	Week's output.	Daily average.
1908	20,075	3,346
1907	22,485	3,749
1906	19,429	3,328
1905	18,830	2,356

Following are the weekly shipments from Cobalt camp, and those from January 1st to date:—

Gold production of the Transvaal mines last month, estimated by Kaffir houses in London, was 550,00 ounces, fine, comparing with 560,329 ounces officially reported for January. February had two working days less than the month before.

Value of the February output, calculated on the basis of the above estimate, compares as follows:—

February, 1908	$11,687,000
January, 1908	11,900,000
December, 1907	12,393,000
November, 1907	11,677,000
September, 1907	11,427,000
February, 1907	10,482,000
February, 1906	8,658,000
February, 1905	7,726,000
February, 1904	6,149,000
February, 1903	4,174,000
February, 1902	2,728,000

MARKET NOTES.

Canadian Pig Iron.—For pig iron there is very fair enquiry, with the two largest Canadian producers reported as doing some cutting, and prices tend easiness. Domestic brands are quoted at about $20, best grades of Scotch at $22 to $22.25, for Spring delivery, and No. 3 English, at about $18.

The Londonderry furnace is blown out, owing to some difficulty over the coke supply. Domestic bars are easy at $1.90, and there appears to be some lack of firmness in general iron products.

Silver.—February 20th, 56 1-4; February 21st, 55 7-8; February 24th, 55 5-8; February 25th, 55 7-8; February 26th, 55 5-8; February 27th, 55 1-4; February 28th, 55 1-4; February 29th, 55 3-8; March 2nd, 55 7-8; March 3rd, 55 3-8; March 4th, 55 1-4.

At a meeting of the McKinley-Darragh-Savage Mines of Cobalt, Limited, held in Toronto March 5th, a new board of directors was appointed, as follows:—

H. W. Sibley, Thomas Finucane, Joseph S. Hunn, and W. L. Thompson, of Rochester; C. A. Masten, Toronto; E. W. Stratman and L. J. Angevine, of New York.

Mr. Masten declined the office of the presidency in the absence in Europe of Mr. F. B. Chapin, who at present holds the office

MINERALS
And How They Occur

A Book for Secondary Schools and Prospectors

BY

WILLET G. MILLER

Provincial Geologist of Ontario; formerly Professor of Geology in the School of Mining, Queen's University, Kingston, Canada

252 pages; price $1.00; post paid. Boards

Dr. Miller's text-book, now in its third edition, has undoubtedly met the requirements of prospectors and students. It is simple in diction, and logical in plan. It comprises exactly the information needed by the beginner and, because of its clearness and simplicity, it is distinctly of value to all classes of mining men.

"Minerals and How They Occur" can be obtained from the Canadian Mining Journal

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

COAL MINING

A gentleman with considerable experience in both flat and pitching veins, and handling of large numbers of men; also holding first-class English and British Columbia, also Alberta Certificates, seeks situation as general Manager or superintendent. Highest references from present employers.

Apply, ENERGETIC, CANADIAN MINING JOURNAL.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals, or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

Branches at COBALT and LATCHFORD, in the silver mining camp of New Ontario.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $1 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch, If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers, kindly mention this Journal.

Dominion of Canada

Synopsis of Canadian North-West Mining Regulations

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

N.B.—Unauthorized publication of this advertisement will not be paid for.

Unbeatable Value in a Fancy Worsted Suit

THE MATERIAL

M.J. 100 An imported Worsted made in England. After looking through all the samples of the largest English manufacturers, we choose this fabric as THE ONE most likely to appeal to the average Canadian of good taste. The Worsted is closely woven and smooth in finish. The predominant colors are black and grey, with a faint suggestion of blue in the background. Note also the subdued over-plaid.

Sizes 35 to 44

STYLE AND MAKING

Without going to any extremes, the style embodies the best ideas brought out by the best makers of men's clothes for 1908. The smart single-breasted effect shown in the cut is an exact representation of it The suit is lined with a mohair twilled serge and is stayed throughout with linen. The coat fronts and shoulders are reinforced with shrunk linen duck and haircloth. The whole suit is sewn with silk and most carefully tailored by expert workmen.

THE PRICE

The tremendous purchase we made of this fabric brought the price down to such an extent that we can make this suit and deliver it to you for about two-thirds of what it would cost you to get it any other way. The price is **$10.50**

Men's "Victor" Boots

M. J. 101. Style V. P. Men's "Victor" Boots, patent colt of selected quality, dull matt calf Blucher tops; pointed, medium and broad toes; all sizes 5 to 10, ; B, C, and D widths..... **$4.00**

Two Sweater Specials

M. J. 102. Men's Hand-Knit pure wool jackets, two pockets, pearl buttons, made in all plain colors, and all club and college colors, collar can be turned up or worn as in cut, sizes 34 to 44. Worth $7.00 each **$5.25**

M.J. 103. Men's hand-knit pure wool sweaters, deep [illegible] of V shaped neck, can be worn to any [illegible] sizes 34 to 44. [illegible] sweater [illegible] by expected at [illegible] each **$2.00**

Sullivan Hammer Drills

IN NARROW VEINS

The use of Sullivan Class "D-21" Hammer Drills for upper holes shows large economy in mining cost.

As this drill requires no separate mounting, it may be carried into any opening where a man can go himself.

Veins may therefore be stoped out with the minimum amount of wall rock, thus reducing treatment charges to the lowest possible point.

FOR TRIMMING UP

the walls, roof and floors of workings, cutting hitches for timbers, and drilling pop holes in boulders, the Sullivan "D-15" Hammer Drill will do six to eight times as much work in a shift as a hand hammer man.

In granite, on straight work, this machine has put in 160 holes, 5/8 in. diameter by 3 in. deep, in one hour.

NOVA SCOTIA'S MINERAL OUTPUT.

The official returns of Nova Scotia's mineral output, given in full on another page of this issue, appeared early in March. The report of the Mines Department will be given fuller notice at a later date. Meanwhile it is timely to notice again the causes that led to the serious decrease in the output of coal. Whilst the Pictou and Inverness collieries increased their annual production by substantial amounts, the Springhill strike almost counterbalanced this gain.

In Cape Breton, owing to the Hub colliery fire, and the unusually late opening of the shipping season, the production was cut down by the serious amount of 175,191 tons.

However, this diminution of output must be looked upon as purely fortuitous. It is hardly probable that the opening of navigation will be delayed again to such an extent as it was last spring. It is also to be hoped that labor troubles will become things of the past. The settlement effects between the Dominion Coal Company and its employees is a guarantee of peace so far as Nova Scotia's largest coal producer is concerned. Hence we may look forward with well-founded hope to a shipping season of unexampled activity.

The Provincial authorities had estimated that they would receive for the past year $725,000 in coal royalties. Events proved that this estimate, for the reasons adduced above, was excessive. In fact the actual amount received was $633,933, or $10,000 less than the revenue for 1906.

It is true, however, that the same causes that, had conditions been normal, would have brought about a large increase of tonnage last year, will again be operative this year. The St. Lawrence trade undoubtedly will be brisker during the approaching season. The local demand is growing heavier and the coast trade with the United States increases yearly. With an open spring and industrial peace Nova Scotia should therefore count upon a larger coal output this summer than in any preceding year.

Incidentally we notice in the Provincial Financial Returns the item of $14,851.17 for miners' relief funds. We mention this because it is our intention to discuss this item fully at a later date.

The tabulated statistics for the year ending September 30th, 1907, include several items, such as antimony ore, cement, bricks, copper, building stone, etc., not before specified in the annual returns.

BEGINNING A UNIVERSITY.

In presenting the University Bill before the British Columbia Legislature, the Hon. Dr. Young remarked that it was not the intention of the Government to decide immediately upon a site for the proposed buildings. The first efforts would be confined to establishing preparatory classes throughout the Province. By this means the germs of practical higher education will be implanted in a large number of young men and the best possible foundation laid for the University.

BRITISH AGITATION AGAINST THE EIGHT HOUR BILL.

Speaking before Mr. Herbert Gladstone, a representative of the British Iron Trade Association outlined the probable effects of the proposed shortening of the hours of labor. Conditions in South Staffordshire were principally referred to. At present the miners start to go down into the mines at 7 a.m. They are allowed a maximum of one hour for meals. Contract men seldom take more than half an hour. Between 7 a.m. and 4 p.m. the output for one gang of contract men is 22 tons or 40 tubs. If the day is reduced to 8 hours the output will be diminished by 9 tubs. The colliers go down in the owners' time and come up in their own time.

In addition to increasing the cost per ton of coal raised the effect upon the iron and steel industry would be marked. It is claimed that in the Tipton district 27 tons of water must be raised for every ton of coal. Decreasing the output by shortening the hours of labor will have the effect of increasing the relative amount of water pumped per ton of coal won to between 32 and 35 tons. This, it is stated, would be ruinous.

The collieries spoken of are owned and operated by manufacturers of iron and steel. Therefore their representative speaks with some degree of authority when he asserts that six shillings per ton will be added to the cost of manufacture of finished iron and steel.

In the foregoing paragraph is contained the essence of the whole matter. Labor unions, by complete organization, have attained a solidarity and, consequently, a political influence that gives their contentions tremendous weight. These contentions are so impressed upon the politicians and statesmen of the day that the claims of the employer are either overlooked or considered as the protests of class selfishness.

Time was when labor and capital were justly looked upon as the two eternal protagonists of our body politic. This conception to-day should be obsolete. The interests of both employers and labor are closely conjoined and are inextricably interwoven with those of every other class. Unreasonable concessions to either side may sometimes appear expedient, but will always be unprofitable and costly in the long run. In Great Britain the predominating tendency is to concede everything to the unions. In Canada, whilst by no means so pronounced, this tendency exists. Legislation, such as the Lemieux Act, is the best corrective that modern statesmanship has devised.

Canadian employers and employees should watch closely the trend of events in Great Britain.

THE HAMMER DRILL.

The air hammer drill is coming into prominence. Whilst it will not replace the reciprocating drill, yet its sphere of usefulness is larger than in commonly believed. The increasing number of types manufactured give it a wider application. Under certain conditions of shaft sinking the hammer drill is undeniably economical. For cutting hitches it is an essential if cheap work is to be obtained. But its limitations for drifting, stoping and cross-cutting have not yet been demonstrated.

In our Special Correspondence columns we give some valuable figures from an actual test.

THE PORT HOOD DISASTER REPORT.

The report upon the recent explosion in the Port Hood-Richmond Coal & Railway Company's colliery, handed in by a committee appointed by the Provincial Government, is not, in some important respects, in accord with the bulk of the evidence adduced. The report itself is reprinted in full in our news columns.

We have before us the evidence taken at Port Hood. Whilst we cannot now enter into a full discussion of this evidence, yet it appears to us that the facts, such as they are, point to an explosion of powder and not of gas. Our readers will have an opportunity later on of deciding the matter for themselves.

Meanwhile we cannot do beter than quote from the last letter of our Glace Bay correspondent, who refers as follows to the present system of coal mine inspection in Nova Scotia:

"There is one matter which is suggested by the eighth clause of Dr. Kendall's resolution, 'the enforcement of laws intended to lessen or prevent accidents,' and that is the personnel of the mines inspectorate of Nova Scotia. One of the facts that can be ascertained is that nothing will so tend to the prevention of accidents and the preservation of life and property as the existence of a vigilant and capable inspectorate. The men who compose the present force of inspectors are good men, we have no doubt, but they were not appointed by competitive examination, and we do not think that any of them are men with a college training.

"The Inspector of Mines should be a man of considerable scientific attainments and extensive knowledge of modern mining methods, in addition to having a thorough grasp of practical mining and all that appertains to it. He should be a man that can advise and direct in

case of emergency and danger, and a man whose advice could be sought and relied upon as proceeding out of a well trained experience added to scientific knowledge. No inspector should be appointed for political purposes, and 'we consider the time has arrived' when no man should be appointed to an inspectorship because of his political preferences, or as a reward of political loyalty. He should be appointed because his qualifications mark him out as fitted for such an onerous and responsible position. To-day when mines are at work in Nova Scotia with 1,500 persons below, in one mine, at one time, whose lives may be endangered by the ignorance or the stupidity of one man, we require inspectors who can enforce regulations, and explain why they enforce them. The Government of Nova Scotia should have a Chief Inspector of Mines, whose scientific and technical attainments should be beyond reproach. This man should appoint his assistants by rigid competitive provincial examination, such as would entirely eliminate the incompetent and raise the status of the inspectorate. Men of this calibre would need and could not be obtained without the payment of adequate salaries, but in return we would get adequate men, and it would open up an avenue of promotion for the young and ambitious mining students of the province. The Inspector of Mines should bear the same relation to the colliery manager that the colliery manager bears to his overmen, and the correspondingly more difficult than the colliery manager examination.

"As conditions are now, the managers and salaried officials of the coal corporations are man whose wide range of experience and technical knowledge, obtained by years of hard study, make them infinitely better able to advise the inspectors than the inspectors are to advise them, which is a reversal of the correct state of affairs. We think it will be found that most of the recent improvements in Cape Breton mining as regards safety —and they are many—have been carried out on the sole initiative of the officials of the coal corporations, who constitute the only body of mining experts in the province."

CONCENTRATION OF COBALT ORES.

We commend to the earnest attention of our readers an article appearing in this issue of The Canadian Mining Journal. The writer, Mr. G. H. Gillespie, has been afforded especial facilities for the study of the subject of Cobalt ore treatment. This article will be followed by others that will deal more fully with details.

Mr. Gillespie's point of view strikes us as being sane and clear. It is true that Cobalt ores present some peculiar difficulties. But most of these difficulties have been overcome in other camps. On the other hand Cobalt has exceptionally favorable conditions. Transportation is good. Labor is plentiful, and supplies are becoming cheaper.

Stress must be laid upon the fact that there is a strict limit both to the amount and to the varieties of ores that can be concentrated with commercial success. For instance, hand-sorting can in some cases be carried on to a much larger extent than now obtains. It is wasteful to put the whole run of mine through the mill. Again, with light stoping drills and narrower stopes the tenor of the ore may be considerably improved. Every pound of unnecessary waste rock handled means a multiplied waste of power, time and money.

We agree fully with the opinion that it is wise to begin with as simple an equipment as possible.

In most of the mines of Cobalt hand sorting of No. 1 ore plays a large part. So far as practicable then this ore should be separated in the initial stages, before and after crushing.

If a stamp mill is to be part of the equipment, the design and practice will be modified by several considerations. It is probable that heavy stamps, dropping between 90 and 110, twenty-mesh screens, low rapid discharge and a light feed will be the salient features developed as experience is gathered. Possibly concentrating tables and slime tables will meet all requirements after this, although it is likely that the average tailings will respond profitably to cyanidation.

We do not believe in a multiplicity of stages. Classifying can often be done most profitably in the mine and on the sorting tables. When classification becomes complicated, profits become correspondingly uncertain.

It is dangerous to dogmatize, however. Simplicity may be an unattainable ideal. But a tendency in the direction of that ideal is healthy.

THE PRICE OF SILVER.

In the year 1868 silver brought $1.326 per ounce. From that year until 1889 there was a slow thought constant recession in price, until in 1889 the figure of $0.935 was reached. Low water mark was touched in 1902, when $0.522 was the average price for the year. For 1907 the average was $0.653.

The world's output of silver in 1900 exceeded that of any previous or succeeding year — 173,591,364 ounces were then produced.

Since 1904 Canada's silver output has gone up in value from $2,075,000 to, roughly, $7,500,000.

A new safeguard for collieries is offered by the discovery of Profs. Elster and Geital that firedamp contains six or seven times as much radium emanation as the ordinary air of coal mines. An aluminum foil electroscope quickly shows the difference of electrical conductivity due to the emanation, and this simple apparatus becomes an effective and important means of detecting danger.

THE MECHANICAL EQUIPMENT OF THE OTTAWA MINT.

(A paper read before the Mechanical Section of the Canadian Society of Civil Engineers.)

By A. H. W. Cleave.

The mechanical equipment of this branch of the Royal Mint was completed by the end of October last—the time occupied in the manufacture and installation of the necessary machinery having been just ten months.

Many machines in the Coining Department have been designed specially for the Ottawa Mint, and in these new devices have been adopted, which are not to found in other similar institutions. In addition to the machinery in that department, where the actual minting of money takes place, the following plants have also been installed:—

(1) The Electrical Plant, for power distribution, for lighting, etc.

(2) The Oil-fuel Plant, for storing and distributing the oil-fuel used throughout the various departments in the melting, annealing, and cupel furnaces, together with the fans and blowers for the same.

(3) The Die-making Plant, for sinking, turning, annealing and hardening the dies used for coinage purposes.

(4) The Plant for the Boiler House and the Machine, Smith's and Carpenter's Shops, in which all running repairs are effected and small tools made.

(5) The Plant for the Assay Department, where all the precious metals received into and issued from the Mint are analysed; and in which experimental research work will be conducted.

To give a full and complete description of all the mechanical devices which have been installed throughout the Mint would make this paper unduly long. Each of the plants enumerated above will therefore be briefly dealt with in turn, in the order given; and then the Coining Department, which contains types of machines probably less commonly known than the rest, will be described more at length.

Electrical Plant.

Electrical Equipment.—The electricity used for power and lighting is supplied in the form of a two-phase, alternating current, and enters the building at a potential of 2,140 volts. It then passes through the transformers, of which there are three for power and three for light. In each case one is a spare, which can be put into circuit, on either phase, by operating the primary and secondary switches.

The transformers for power operate the motor of a motor-generator set. They are single phase, step down, oil insulated, self cooled, for a circuit of 60 cycles. The primaries are wound for a potential of 2,140 volts, and the secondaries for a potential of 500 volts. Their normal full rating is 100 kilowatts each.

The transformers for light operate the electric light system of the building. They are similar to the transformers for power, but the secondaries are wound for a potential of 107-214 volts; while their normal full rating is 15 kilowatts. The primaries and secondaries of each transformer are provided with binding posts, so that any one of them may be conected or disconnected without soldering to leads, or cutting wires.

The motor-generator set for transforming the current to operate the motors throughout the Mint consists of an alternating current motor and continuous current generator. The motor is of the two-phase, alternating current, induction type, operating from the transformers at a potential of 500 volts; its normal full rating being 225 H.P., at a speed of about 800 revolutions per minute. The generator is multi-polar, compound wound, continuous current, operating at a potential of 225 volts; its normal ful lrating being 150 kilowatts. The motor and generator are on one bed plate, and supplied with auto-starter for the motor, and field rheostat for the generator.

There are 32 compound wound, continuous current motors in use, ranging in power from 1 1-4 H. P. to 30 H. P., all operated at a potential of 220 volts.

The wiring for the motors is of the parallel two-wire system, the wires being carried in steel conduits.

The wiring for the lighting is of the interior conduit system; all the main circuits being of three wires, and the branch circuits of two wires.

There are 415, 3.5 watt, 16 C. P. 102-volt incandescent lamps, and 17 arc lamps. The latter are of the enclosed type for multiple circuits, adjusted for 7 amperes and 107 volts, alternating current.

The buildings are wired for electric clocks, bells and telephones, which are in use throughout the Mint.

Oil Fuel Plant.

Oil Fuel Equipment.—The fuel used for melting and annealing purposes, and for the cupel furnaces in the Assay Department, is crude oil; its specific gravity being .850. The plant for storing, distributing and burning this fuel consists of:—Four storage tanks (each of 2,000 gallons capacity), two rotary pumps for distributing the oil throughout the buildings, three pressure blowers, four melting furnaces for crucibles holding 90 pounds each, one strip annealing furnace, one blank annealing furnace, one die hardening furnace, and three cupel furnaces and two small melting furnaces for the Assay Department. In melting and cupel furnaces an air blast is used in conjunction with the oil; while in the annealing furnaces and die hardening furnace dry steam is used, at a pressure of 60 pounds per square inch. The oil pumps are so arranged that the fuel is delivered to the furnace at constant pressure. All oil pumped, but not used, is returned through a spring-loaded valve to the storage tanks.

The tanks are supported on concrete bearers, one at either end, and one at the centre of each tank, so that the air may circulate freely around them. The piping for these tanks is so arranged that each one may be filled or emptied separately. Each tank is also fitted with a return pipe from the pumps, and a vent pipe through which all fumes rising from the oil are lead to the roof of the building. The air for the blast used in the melting furnaces is drawn from the tank room, so that the air round the tanks is constantly changed.

This fuel is found to be very economical, and excellent results have been obtained from all the furnaces. The heat can be regulated without difficulty, and, in the

melting furnaces, either nickel or aluminium may readily be melted.

Die Making Plant.

Die Department.—The machinery in this department consists of a die sinking press, two die turning lathes, and a die hardening furnace. The press and lathes are driven by a motor through an overhead shaft. In the die press the blow is given by a heavy fly wheel, 5 feet in diameter, which is keyed to a triple screw of 6 inches diameter. The fly wheel is actuated by two rapidly revolving discs, which can be brought into contact with its leather covered rim. One friction disc raises, and the other depresses the screw. The operator works the press by depressing a stirrup rod with his right foot. This action brings one of the friction discs into contact with the rim of the fly wheel, and thus the required blow is given to the die. On the operator withdrawing his foot, a balance weight raises the stirrup, the other friction disc comes into operation, and the screw is raised. After the blow has been delivered, the height to which the screw shall rise is regulated by a brake adjustment; and having reached that height, it remains there until the stirrup is again depressed. In this press a blow may be given varying from a few pounds to about forty tons.

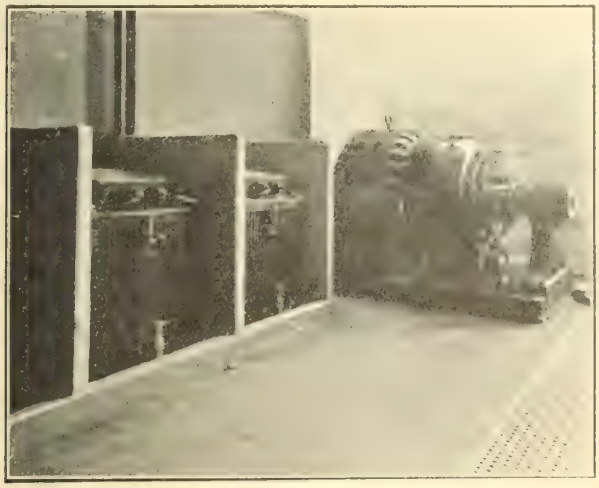

Fig. 1—Motor-generator set and power transformers.

Each coinage die requires three blows from the punch before the impression received is sufficiently sharp in all its details. After each of the first two blows the die is annealed in the die furnace. After the third blow it is turned to the correct size, and then hardened and tempered; after which it is ready for use in the coining press. It is usual for a pair of dies to strike about 80,000 pieces before they are unfitted for further use.

Machine Shop.

Repair Shops, etc.—In the machine shop the following tools have been installed:—

One 14-inch by 72-inch Norton roll grinding machine.

One Brown & Sharpe, No. 13, universal grinding machine.

One Brown & Sharpe, No. 2, milling machine.

One Bertram planing machine.

One Barnes 21-inch drilling machine.

One sensitive drill.

One 16-inch gap lathe.

One 14-inch, Pratt & Whitney lathe.

One shaping machine.

One polishing spindle.

In addition to the above, fitters' benches, grindstone, power hacksaw, etc., have been installed.

The roll grinder and the planer are driven by their own motors, while the other machines are grouped.

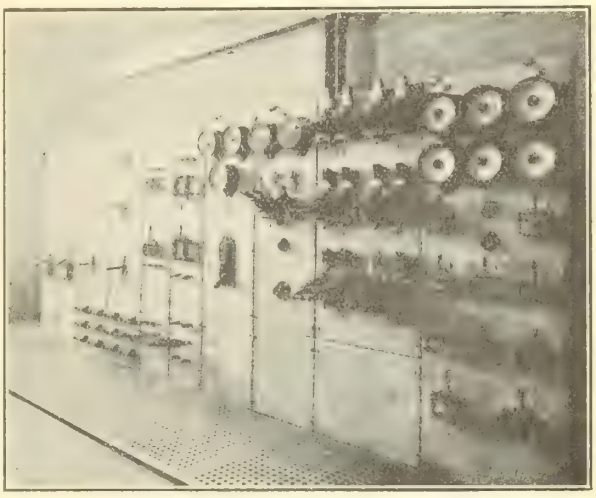

Fig. 2—Main switchboard in power room.

An elevator is situated in one corner of the shop, communicating with the smith's shop, which is in the basement next to the boiler room.

The smith's shop contains a Buffalo down draft forge, a Fairbanks' 100-pound power hammer, shearing machine, etc.

The boiler room is equipped with two marine type multitubular boilers, which are used for heating the Operative Department, by steam, during the cold weather; for supplying hot water throughout the buildings; and for supplying steam to the annealing and die furnaces, and to the drying apparatus. Hard coal is used in these boilers, and a pressure of 80 pounds per

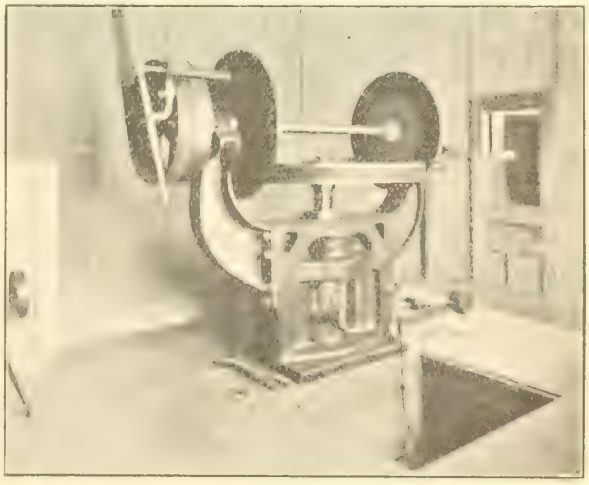

Fig. 3—Die making press in Die Department.

square inch is maintained. The boilers are fitted with connections so that either, or both, may be used for any of the above services. The steam for heating the building, before entering that system, passes through a reducing valve, so that the pressure is reduced to 10 pounds per square inch. The returns from the heating

system are lead to a hot well, and are returned to the boilers by a duplex feed pump. The boilers may also be fed by means of a Pemberthy injector, or direct from the mains, in case of necessity, and when the steam pressure is below 40 pounds per square inch.

The carpenter's shop is in the basement, next to the smith's shop, and contains a variety saw, a 12-inch wood

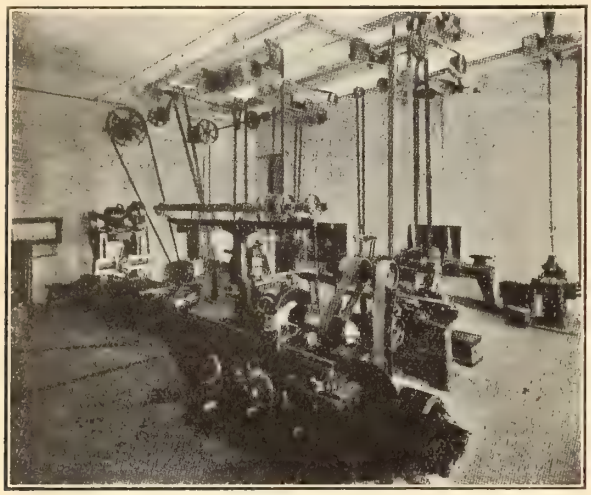

Fig. 4—Machine Shop.

turning lathe, and a carpenter's bench. The saw and the lathe are driven from an overhead shaft by a motor, which also drives the shafting for the blacksmith's shop.

Assaying Plant.

The Assay Department.—This department is situated in the front building, and occupies three floors. In the basement the motors and blowers for the furnaces are installed, and here also are stored the acids, chemicals, etc. The furnace room is on the ground floor, and contains three cupel and two melting furnaces; all heated by oil fuel in conjunction with an air blast. The second floor is occupied by the laboratory and scale rooms.

In this department is an elevator, communicating with all three floors, which may be used either for passengers or for the conveyance of apparatus, acids, etc., to the various rooms. Additional communication between the three floors has also been provided, in the form of a spiral stairway. Fume chambers have been installed in the laboratory and furnace room, together with the necessary chemical and physical apparatus for assay and experimental work.

The Coining Department.

For the purpose of describing the machines used in the actual processes of minting, it may perhaps prove interesting, and more intelligible, if the various operations through which the metals pass while being transformed from ingots into finished coins, are stated in order of sequence, and then are dealt with separately. A short description of each machine and the part it takes in the production of the coins will in each case be given.

The operations are as follows:—Melting, rolling, adjusting, cutting, marking, annealing, blanching and cleaning, coining, testing.

Melting.—The ingots (of a purity of 999 parts per 1,000, or over) are placed with the necessary alloy in the crucibles, and charged into the melting furnaces. There are four of these furnaces altogether, each one taking a No. 30-35 crucible (about 90-110 pounds of silver). Crude oil is used as fuel, in conjunction with an air blast. The oil (sp. gr. 32-34 B.) is delivered to the furnaces in very fine streams at a pressure of about 25 pounds per square inch, and is mixed with air from a low pressure blower (air blast about 10 ounces per square inch).

The flame does not play directly on the crucible, but first strikes a fire brick, and is then deflected so as to travel round the crucible, and then to the flue.

These furnaces are very clean, economical and easy of manipulation. It is usual, in the case of silver, and starting with a cold furnace, for the first round to be ready for pouring one and a half hours after lighting up. After the first round has been poured the furnaces have become thoroughly warmed up, and the subsequent rounds are ready for pouring one hour after charging in. It will thus be seen that in an ordinary working day of eight hours, metal can be poured six times from each furnace.

The flues are so arranged that the gases issuing from the furnaces enter a large condensing chamber, where they expand rapidly, and their velocity is reduced. In passing through these chambers the gases strike against baffle-plates (the course taken by them being in the form of the letter S placed on its side), by means of which their velocity is still further reduced. Any fine particles of metal which may be carried by them from the furnaces are deposited on the baffle-plates and sides of the chambers, and are thus prevented from being carried away through the chimney stack.

This treatment of the gases results in the saving of a considerable amount of metal, as is clearly shown in the annual report of the Director of the United States Mint. From this report it appears that, after six months' working, the value of the metals recovered from the condensing chambers attached to 13 furnaces, was no less than $12,900.00.

After the metal has been melted, it is poured into cast iron moulds, forming bars about 24 inches lon 1-2 inch thick, and varying in width fro 1 1-4 inches, according to the denomination of coin to be made. The

Fig. 5—Boiler House and Smith's Shop, showing two marine type high pressure boilers, power hammer, shearing machine and Buffalo down draught forge.

newly formed bars are removed from the moulds as soon as they have become solid, and plunged in a weak solution of sulphuric acid; after which they are washed and dried. They are then taken to the shearing machine and revolving files, where the spongy ends are removed,

and the rough edges trimmed. They are then ready for the rolilng mills.

The shearing machine is of the usual single ended pattern, such as used in machine shops, fitted with fast and loose pulleys, and driven from an overhead shaft.

There are two revolving files, each consisting of a headstock, with shaft, and single pulley between the bearings. On one end of the shaft, outside the bearing, is keyed a circular file of about 6 inches diameter and 6 inches long. These files are also driven from the same overhead shaft as the shearing machine, and revolve at 150 revolutions per minute. The bars from each crucible are kept separate from those from any other crucible, and are marked with distinctive letters and figures, so that their origin can be readily traced at any time. A small piece is cut from one end of the first and last bar from each crucible, and these pieces are forwarded to the Assay Department for testing purposes. The bars are not operated upon until the report from that department has been received, stating that they are within the legal remedy as to fineness. All bars which are above or below the legal standard are re-melted with the necessary amount of alloy, or fine metal, to bring them within the remedy.

All the worn out crucibles, covers, etc., are ground to a fine powder in a mortar mill; the powder being washed, so as to recover any metal that may have been taken up during the process of melting.

The powder is washed twice, after which it is sold by public tender, the tendering firms being allowed to take samples beforehand.

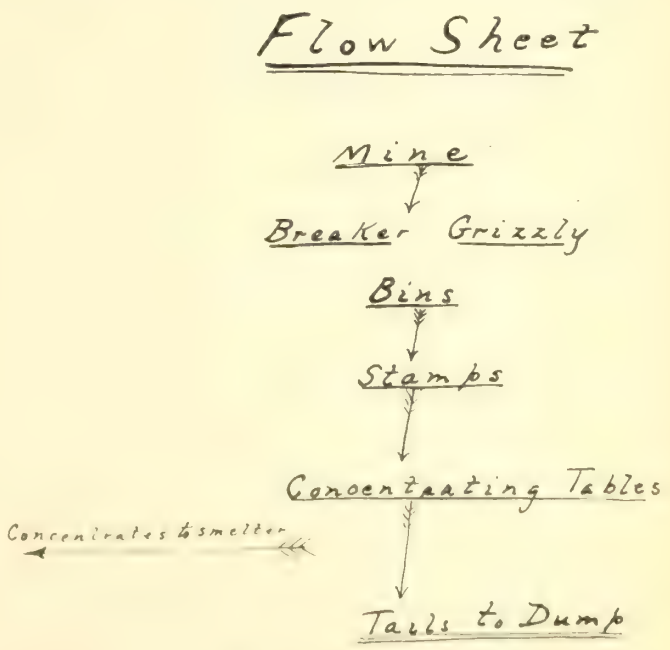
The mortar mill used for reducing the worn out crucibles, etc., is fitted with an under-driven revolving pan, five feet in diameter, has fast and loose pulleys, and is driven from an overhead shaft by a 5 H.P. motor. After the powder has been washed, it is dried in a steam-heated drying pan, 8 feet long, 4 feet wide, and 10 inches deep. It is then thrown into bins, where it is stored until sold.

(To be Continued.)

CONCENTRATING COBALT ORES.

G. H. GILLESPIE, M.E.

The problem of concentrating the ores of Cobalt is a complex one. It is, however, a problem that can hardly be considered entirely new. Every mining camp has its own peculiar features, which can only be worked out by experiment and by practical operation on a small scale. It is better, therefore, in adapting the principles of concentration to new ores to begin the practical application on a small scale and with a limited outlay of capital. The main aim, from the business point of view, in placing a concentrating mill in operation on a mine is, therefore, the treatment of low grade ores in a plant that is the most commercially efficient and that has been erected at the smallest initial outlay of capital.



It must always be remembered that the capital outlay on a mill must be written off against the quantity of ore available for treatment during the lifetime of the mine. Therefore, the plant, which by large initial outlay of capital, gains in theoretical efficiency of extraction over a less costly plant, should that initial capital expenditure be out of proportion to the available tonnage, will in the end prove to be a much more costly plant both in respect of capital invested and in cost per ton of ore treated than one which simply aims at a commercial efficiency to begin with. In other words, the mill which at lowest first cost will give good results is more to be aimed at than the attainment of the utmost theoretical efficiency. As the plant increases in size with growth of tonnage the efficiency of extraction can be increased.

It is not advisable to make large capital expenditures to effect small savings per ton on a small installation. Such capital expenditures are, of course, requisite on large operations such as the "Homestake" mine where on a large tonnage treated a few cents per ton may make large profits in a year's operation. Large plants are the results of industrial evolution over a long period of years and on an assured tonnage. What is possible in practice on a large plant is, therefore, not often commercially advisable on a small plant.

The concentration of argentiferous ores is one of the oldest of all concentration problems. It was tackled a long time ago at two camps where conditions were similar to those existing at Cobalt. These mines were: The Peck mine, Bradshaw Mountains, Arizona, and Silver Islet, Lake Superior, Ontario.

The Peck mine ores were native silver, wire sheet and nugget, associated with chloride of silver, galena and zinc blende. The Silver Islet ores presented a general similarity to those of Cobalt.

The problem in each of these three cases stated is, generally speaking, similar; being the separation of the

silver along with associated sulphide and arsenide minerals from a siliceous or calcareous gangue.

Cobalt ores are native silver, flake sheet and massive, associated with nickel and cobalt arsenides as well as some of the complex sulph arsenides of silver.

The methods which gave results in treatment of the Peck mine ores and of the Silver Islet ores should, therefore, so far as concentration is concerned, be ap-

plicable to the concentration of the Cobalt ores. The variation in practice would arise from the modernization of machinery during the past twenty or thirty years, and the application of such processes as the cyanide or hypo-sulphide to the mill tails. These processes for treatment of mill tails were not invented at the period the two camps mentioned were in operation.

The practice in the cases cited was for low grade ores.

The results obtained from this practice were exceedingly satisfactory.

In designing a concentration plant for the treatment of the ore of a camp, or preferably of a mine (as the ore found in individual mines in any camp may present points of divergence in type that would call for individual treatment and design), the points to be borne in mind are:—

(1) The plant must suit the ore, not the ore the plant.

(2) The plant should be for the treatment of the largest quantity of the lowest grade ore that can be commercially handled; that is, the mine must first be opened up on an extensive scale and the ore occurrence studied.

The general classification of the Cobalt ores up to the present may be given as:—

(1) No. 1—Shipping grade ore.

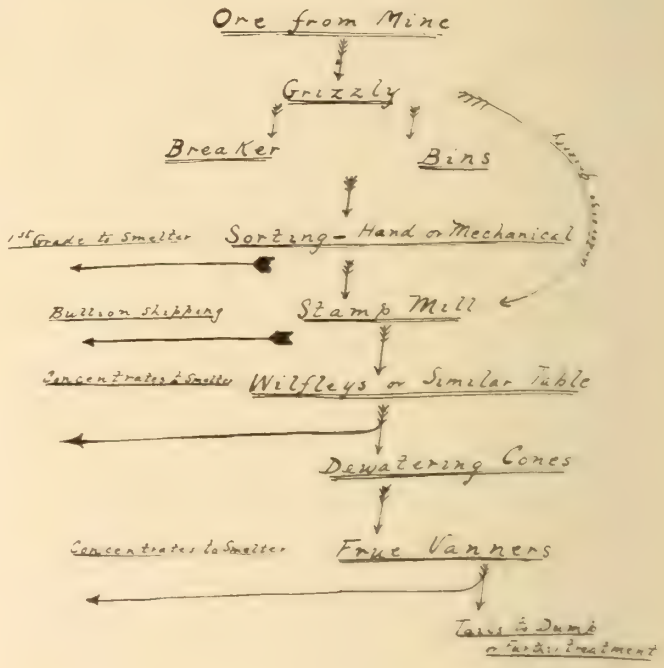
(2) No. 2—Screenings from picking tables, sometimes of shipping grade.

(3) Ore in greatest bulk too low grade to ship direct from the mine. This must either go to the mill for concentration or go to storage on the dumps.

The valuable constituents in the Cobalt ores are for high grade ore, smaltite, niccolite and native silver; in the low grade or concentrating ores, silver (leaf and flake) and in some cases the sulph-arsenides or sulphides of silver, associated with a small percentage of smaltite, but scattered through a mass of wall rock which is, roughly speaking, silica. The problem is further complicated by the occurrence in the mines of this impregnated wall rock, which is often extremely irregular, so that it is difficult to maintain any uniform average of values in ore to the mill.

The aim of concentration in the Cobalt district should therefore be:—

(1) Save as much of the valuable contents of the ore as is commercially advisable at as low a cost as possible. I use the expression, commercially, as there may be a tendency to make concentration too complicated, and costly. The more simple the process is made, consistent with a commercial saving, the more efficient and economical of operation the plant should prove.



(2) Separate as much of the silica matrix as possible from the valuable ore to reduce freight and smelter charges.

(3) Even in the case of low grade ores it will be found that some of the native silver occurs in a massive form. The process to be installed should aim at the removal of this massive silver as early as possible in the progress of the ore through the mill and to collect as much as possible of this silver in the form of metallics; to be run into ingots for shipment as base bullion.

I would suggest as the result of experiment on the ores of this camp the following method of milling, and concentration, as one that would give good results both as to efficiency and economy of operation and installation.

Flow Sheet.

Method of Concentrating Cobalt Ores

The milling plant should, of course, be placed in the most suitable position to take the ore from the mine at the lowest possible cost.

The ore after delivery to the mill would go over a grizzly set to mesh of final breaker size; i.e., size to be fed to mill, say 1 inch ring oversize on grizzly; next through a rock breaker of standard type, preferably gyratory, set to 2 1-2 inch ring; thence over a picking belt or mechanical sorting device for removal of high grades; next through second breaker set to 1 inch ring; thence to stamp mill bins; next to Wilfleys, or similar tables; thence to dewatering cones; finishing on frue vanners; tails to dump or to final treatment.

The principal value in the ores of Cobalt calling for concentration is metallic silver. I advocate therefore, the preliminary sorting out of high grades before pulverizing for concentration; as experience in milling has taught me that it is exceedingly inadvisable to mix a small quantity of high grade with a large quantity of low grade highly siliceous ore, and then to attempt concentration of resultant mixture, which would be a tonnage presenting great variations in character and value. It will often be found that tails from a mill running on ore of variable grade will appear to give low results; i.e., high extraction. But if an attempt is made to examine ore from the viewpoint of actual loss, startling results may be found.

Let me state a case, that of a mill crushing 100 tons of ore per day of variable grade ore:—

> Two tons high grade, 3,000 ounces per ton.
> Ninety-eight tons low grade, 5 ounces per ton.
> Average value per ton of 65 ounces. Average tails from mill, 10 ounces per ton.

Now 98 tons had only 5 ounces per ton to start and 10 ounces per ton were lost. Therefore in a case of this kind no saving was made by treatment of 98 tons and as total loss was 100 tons by 10 ounces, or 1,000 ounces.

The loss in low grades, $98 + 5 = 490$ ounces.

Therefore, 510 ounces must be directly traceable to loss on two tons of high grade or much more than enough to pay for preliminary sorting of high grades and to leave a good profit. It wil be noticed, also, that an average tailings loss of 10 ounces per ton on 100 tons of 65 ounces ore would mean an 85 per cent. extraction, which at first glance would appear to be quite respectable.

It may be that by stripping ore in mining (where possible) and sacking this ore underground will be a solution of the problem, and where high grade ore will not strip to admit of this sacking, breaking the stopes as narrow as possible, allowing the ore to come down mixed with as small a quantity of low grade or wall rock as practicable, sending this small quantity only over the picking tables, and allowing the large tonnage of known low grade to go past the picking table direct to mill without preliminary sorting, high grade ore such as found in this camp will stand a fair cost per ton for sorting. It must be borne in mind that anything saved by hand picking means 100 per cent. extraction, an extraction which no process of concentration will ever give.

The stamp mill has been successfully applied in many instances to the milling of ores containing native metallics.

The stamp mill as used in crushing ores for concentration may to many appear to be old-fashioned. It is really one of these old methods of crushing which has a wider and more general application than the more recent methods of rolls or roller mills.

The roll is a more specialized machine, good for certain purposes, but in my opinion not particularly suited for crushing the ores found in this camp and its application tends to complicate the practice and to increase the cost of installation.

The common objection to stamps, that of unequal crushing and sliming, can be largely overcome in crushing for concentration, by low discharge, double discharge, coarse mesh, or in other words quick discharge. Get pulp out of mortar boxes as soon as it has reached the desired mesh. The sliming tendency found in gold milling, where battery amalgamation is practised, is largely caused by the necessity of crushing at that rate at which gold will amalgamate in the mortar. Hence by high discharge and fine mesh, the pulp is held in the mortar longer than is really requisite for the simple operation of crushing.

The stamp mill presents an advantage over other methods of crushing as applied to these ores, in that, by what may be termed the jig action of stamp heads in the mortar boxes, the heavy particles of massive silver will tend to fall to the bottom of the mortar boxes, and have a secure lodgment among the dies, where such silver can readily be recovered and, by the scouring action of the stamps due to revolving motion of stamps, in such condition that it can be run into ingots after recovery for shipment as base bullion.

Jigging has, of course, wide application in the concentration of certain classes of ore. However, when the ore has undergone previous hand sorting to remove the high grades there can be no great need of the application of jigs to the ores left for concentration.

Jigging in my opinion is open to several objections in concentration of ore of this type where the principal values are found as metallics in a siliceous gangue.

(1) The occurrence of the silver in the wall rock, which constitutes the great bulk of the ore requiring concentration, is such that if we compare two particles of ore (say from 3-8 inch jig heads of equal mass), respectively, one particle of barren wall rock containing no values and the other piece of wall rock containing leaf or plate silver, then, since the silver is present in such minute quantity, the metallic contents of this class of ore cannot well be expressed in terms of percents. It must be expressed as merely ounces per ton. Further, the presence of this small amount of silver causes no marked difference in the specific gravities of the two particles. The jig being set to save particles of a much greater range of difference of specific gravities than would exist for the case stated, there is a decided tendency to throw out the valuable particle with the barren particle, both going to waste.

This is not a suppositious case, but will be found to be generally true of jigging as applied to this class of ore, and will be true for all meshes of jig product.

(2) As has been previously stated, one of the objects of concentration should be the cutting down of the silica contents of the shipping product. It is a difficult matter to do this, and to make an efficient saving by jigging. If saving is high, silica will be high, if silica is low, loss is high. Loss in jigging can of course be offset by regrinding tails from jigs in a stamp mill, chilian, ball, or other mill and reconcentrating over tables. But why complicate the process in this way? The same results can be obtained in the first stage of milling.

(3) In jigging, little or no silver can be saved in a state that admits of running into bars for shipment as base bullion.

With due attention to speed, drop, mesh discharge and other factors governing the crushing efficiency of the stamp mill, the resultant pulp will be in such a shape as to call for little or no classification.

The whole pulp after discharge from the mortars would go direct to the Wilfleys. Ample table capacity should be provided. In fact the provision of ample table capacity to prevent overloading is one of the most important factors in mill design.

The Wilfleys would make a high grade, low silica, concentrate to smelter; sands to follow on after dewatering to frues.

Any standard type of dewatering device would be suitable. It is necessary to remove excess water before feeding pulp to frues. Ample vanner capacity must be provided. Frues would give low grade, high silica concentrates to smelter. The feed of pulp, and water, and set of all tables is of course a most important matter. No table will give good results unless it is properly handled. The resultant tailings from frues could be sent over canvas or blankets. It is, however, more probable that, should tails carry commercial values, a finishing process, such as cyanide, will be found most applicable. It is not advisable to attempt to instal a finishing process until the grade and value of tails has been ascertained from actual practice.

Sampling for Mill Check.—Accurate and close mill check samples on mill tails in dealing with the ores of this camp is peculiarly necessary. This will be more marked in cases where ore has not been subjected to a preliminary hand or other sorting. It is an exceedingly difficult matter to get any accurate sample of heads to mill. The check must largely come from sampling resultant product and tailings. Accurate sampling devices are therefore requisite.

Should the sampling of tailings be done intermittently it would be difficult to get any accurate indication as to mill results.

The variation in the grade of the ore being very great, at one period low grade may be passing, then suddenly a change to high grade, and so on. A mill may give low average tails, but high tails on high grade ore with the same mill practice. In other words, losses expressed as percentages mean nothing unless the value of heads to mill is given.

> Eighty-five per cent. concentration on 20 oz. ore is good practice.
>
> Eighty-five per cent. concentration on 200 oz. ore is not good.

In the treatment of ores carrying native metallic values, one of the points which I wish to emphasize is: As the high grade silver ores of Cobalt contain values in cobalt, nickel and arsenic, these high grade ores can be handled by preliminary hand or other sorting.

Is it good practice to concentrate a bonanza ore? If mining methods make it necessary for high grades to go to concentrator, why not, where possible, change these mining methods? In gold milling practice ore of $100 per ton or upward is in most cases milled in a unit separate from those in which ore of $10 per ton is treated. It is recognized that greater care is required in the handling of high grade than in handling low grade ores. But this care cannot well be given when the high grade is mixed with a great mass of exceedingly low grade material. The impregnated wall rocks, the real concentrating ore of Cobalt, is really a milling rock complicated by the presence of a small percentage of arsenides. One does not jig a gold quartz. Why jig a siliceous ore, carrying exceedingly small percentages of ore separable by concentration?

The stamp mill with a follow-on process of concentration presents the following advantages:—

(1) Certainty of crushing efficiency.

(2) Saving of heavy metallics in mortars.

(3) Simplification of screening devices and classification; the doing away with elevators (always a source of trouble in a mill); handling all the ore through the mill by gravity, a great advantage in the handling of low grade ores; reduction in the number of stages of pulverization.

(4) The cutting out of values at early stages in the passage of ore through the mill.

(5) Cheapness of installation.

(6) Economical operation.

(7) Efficiency of concentration.

POSSIBILITIES IN THE ELECTRIC SMELTING OF IRON ORES.*

By Alfred Stansfield, D.Sc., Montreal.

(Ottawa Meeting, March, 1908.)

In view of the many recent attempts that have been made to employ electrical energy instead of fuel for the smelting of iron ores, it appears worth while to indicate, in a short paper, what can probably be accomplished in this direction, the manner in which the successful results can be obtained, and the advantages and drawbacks of the electrical process.

In ordinary metallurgy of iron the ore is smelted in a blast furnace with coke, producing pig iron. This is an alloy of iron with some 2 per cent. to 4 1-2 per cent. of carbon, 1-2 per cent to 4 per cent. of silicon and small quantities of other elements. It is decidedly more fusible than wrought iron or steel, and on this account is very suitable for foundry purposes. Bessemer steel and open hearth steel are made from pig iron by removing from it in the Bessemer converter, of the open hearth furnace, a considerable proportion of the carbon silicon, etc., which it contains, the product being nearly pure iron retaining a little carbon and some manganese.

Crucible steel is used for tools. It contains about 1 per cent. of carbon, and is made by adding the necessary amount of this element to pure varieties of iron or steel, and melting the material in crucibles so as to obtain a perfectly sound product.

Electrical energy has recently been employed to replace, in such operations, the heat which is ordinarily obtained by burning fuel. Electrical energy is somewhat expensive, and it was naturally employed at first for the production of the more valuable products, such as crucible steel, where the cost is of less importance. The electrical production of cast steel for tools and similar purposes may be accomplished in two ways—(1) by melting down pure varieties of iron and steel with suitable additions of carbon and other ingredients, just as in the crucible process, but using electrical energy for heating instead of coke or gas; (2) by melting a mixture of pig iron and scrap steel as in the open hearth process, and removing the impurities, such as sulphur and phosphorus so thoroughly by repeated washing with basic slags that a pure molten iron is at last obtained. This can then be recarburised and poured into moulds. Both of these methods are now employed commercially for the production of good qualities of tool steel. The larger sizes of electrical furnace that have already been constructed hold 5 or 10 tons, while the crucible will only hold about 80 pounds, and the high efficiency of the electrical method of heating more than compensates for the greater initial cost of electrical energy as compared with heat derived from fuel. The resulting steel is found to be even better than crucible steel, and can be produced at less cost. It is therefore, only a question of time until the crucible process shall be entirely replaced by the electrical process in all localities where electrical energy can be produced at a moderate figure.

Two forms of electrical furnace have been used for making cast steel:—(1) the Héroult steel furnace, which resembles an open hearth furnace, through the roof of which hang two large carbon electrodes. Electrical connections is made to these carbon electrodes and electric arcs are maintained between the lower end of each electrode and the molten slag in the furnace, thus producing the necessary heat. This form of furnace has been found to be very suitable for the second of the above processes, that is, the one in which pig iron and scrap steel are melted together and refined until pure enough to convert into cast steel.

An entirely different form of furnace has been devised in which no electrodes are required. This furnace consists of an annular shaped trough containing the steel. This ring of steel acts as the secondary of an electrical transformer. An alternating current is supplied to a primary winding, and the primary winding and the ring of steel both encircle an iron core, as in the ordinary transformer. The alternating current in the primary circuit induces a very large alternating current in the secondary circuit, that is, in the ring of steel, and in this way enough heat is produced to melt the steel. This type of furnace has been constructed lately in somewhat large sizes holding as much as 8 tons of steel and consuming 1,000 electrical h.p. It is apparently wel lsuited for the first mentioned process, that of metling down pure varities of iron and steel, just as in the crucible process.

The amount of energy needed in these furnaces amounts to about 800 or 900 K.W. hours per ton of steel, using cold stock, or 600 or 700 K.W. hours when the pig iron, which usually forms part of the charge, is supplied molten. This amount of electrical energy would cost more than the coal used in producing the same amount of steel in the open hearth furnace, but the resulting steel is far more valuable than the open hearth steel.

The above short account of the production of crucible steel in the electric furnace has been introduced, as this is the only commercial process for the production of iron or steel, which is at present in operation. The present paper deals rather, however, with the electrical smelting of iron ores.

In reducing iron ore to a metal, iron can be abtained in a relatively pure state, such as wrought iron, and this was the method adopted by the acient metallurgists in their small furnaces or hearths; but in the modern blast furnace, with its higher temperature, the coke which is needed for the production of heat carburises the resulting iron, producing nig iron. In the electric furnace, however, fuel is not used for the production of heat, since this is obtained electrically. Some carbonaceous material must be added to the charge in order to eliminate the oxygen of the ore yielding metallic iron, but the amount of this carbonaceous material can be regulated so as to yield either pure iron, steel or pig iron at will.

Although this has been realized by the pioneers in the electric smelting of iron ores, certain difficulties in the operation have led them to smelt the ore for the production of pig iron instead of for the production of steel, although the difference in price of these materials would be sufficient to pay for all the electrical energy needed for the direct production of steel from iron ore.

*Journal of the Canadian Mining Institute. Part of Vol. XI.

and it is surprising that this more attractive proposition has not gained more attention from metallurgists.

A number of experiments have been made on the direct reduction of steel from iron ore in the electric furnace, but the most satisfactory work that has been accomplished relates to the production of pig iron from the ore, and this will be described first. This work has been carried out by Héroult, Keller and others. The furnaces they have adopted are similar to the one employed by Héroult recently in the experiments at Sault Ste. Marie. This consisted of a vertical shaft similar to a small blast furnace, in which hung a central carbon and served as the other electrode, the electric current passing between the hanging electrode and the molten metal in the crucible of the furnace. The ore, with fluxes and carbon sufficient for its chemical requirements, was fed in around the vertical electrode, and became heated and melted by the heat produced by the passage of the current. The electric current in this furnace produces enough heat to carry out the chemical reactions involved in the reduction of the ore to metal, and the fusion of the resulting pig iron and slag. The carbon is required for the reduction of iron oxide to metal and for the carburisation of the metal to form pig iron.

The Keller furnace is practically the same as the Héroult furnace, except that it consists of two shafts instead of one and that these two shafts are worked in conjunction with one another, the current entering through the vertical electrode in one shaft and leaving by the vertical electrode in the other shaft. A connecting trough or passage enables the electric current to flow form one part of the furnace to the other, and serves to collect the resulting pig iron and slag from both of the shafts. This has the advantage of using a higher voltage than the single shaft furance of Héroult. The results of operating furnaces of this class show a consumption of electrical energy of about 0.3 h.p. year, and about 800 or 900 pounds of coke or good charcoal per long ton of pig iron. Supposing that the general costs of operating this furnace and the blast furnace were equal, these figures would indicate that the electrical furnace would need to obtain energy at a cost per h.p. year of less than that of two tons of coke in order to compete with the blast furnace. Thus, if coke costs $3.00 a ton and electrical energy $5.00 per h.p. year, the cost would be about the same by the two processes, and with power at $12.00 per h.p. year, the electric furnace could not compete with the blast furnace unless the price of coke were as high as $7.00 per ton. In considering these figures it should be remembered that the heating power of one electrical h.p. year, is about the same as that of three-quarters of a ton of good coal or coke, assuming that the latter is completely burned. Looked at from this point of view, it will be obvious that even these small and admittedly imperfect electric furnaces are more economical, that is to say, they use the heat better than the large blst furnaces.

The electrical furnace possesses certain advantages over the blast furnace, which in some cases may over ride the high cost of electrical power. One is its ability to use without much trouble ores of a sandy or powdery character. This ability depends upon the absence of a blast in the electrical furnace. In the blast furnace powdery ores are liable to be blown out of the furnace by the blast, or it obstructs the passage of the blast through the furnace. In the electric furnace there is no blast introduced and these difficulties are less serious. Another advantage of the electric furnace is in regard to the smelting of titaniferous and other difficultly fusible ores. On the blast furnace these ores are liable to give trouble on account of the slag becoming pasty, but in the electric furnace it is possible to obtain a higher temperature and thus to overcome any difficulty of this kind. The high temperature which can be obtained in the electric furnace is advantageous in regard to the treatment of sulphurous ores. In the iron blast furnace, the sulphur contained in the coke or the ore is prevented from entering the pig iron by the present of lime and by maintaining strongly reducing conditions in the furnace; the lime then forms calciumsulphide, which passes into the slag. In the electric furnace it is possible to obtain higher temperatures, thus enabling a larger proprtion of lime to be used, and even more strongly reducing conditions to be obtained than in the blast furnace. Large amounts of sulphur can, therefore, be eliminated in the electric furnace, as has been shown in the experiments at Sault Ste. Marie.

Another point in favor of the lectric furnace is that it does not require, as the blast furnace does, a very high quality of coke for fuel. In the blast furnace a soft or powdery coke becomes crushed and obstructs the action of the furnace, and is less efficient than a harder variety; but in the electric furnace, where the coke or charcoal is needed merely as a chemical re-agent, any convenient form of carbon can be employed—coke, charcoal or small, anthracite—and probably in improved furnaces even such fuel as peat, sawdust or soft coal could be utilized for reduction for reduction.

Looked at from a commercial point of view the electric furnace producing pig iron has many difficulties to overcome before it can compete successfully with the blast furnace. One very important difficulty is the small scale on which the electric furnace has so far been constructed. It will be seen from the account of the Héroult furnace that the height of the shaft of this furnace is limited by the length of the electrode, which is introduced into it. More recent furnaces have been designed by Dr. Haanel and by Mr. Turnbull, in which this difficulty has been overcome by a system of inclined or lateral shafts down which the ore passes, so that the electrode does not hang down the whole height of the ore column. Another weak point in the construction of the electric furnace is that no provision has been made for utilising the carbonaceous gases which escape at the top of the furnace. In the Turnbull furnace already referred to, it is proposed to utilise the gas by burning it in a rotating tube furnace down which the ore passes before it enters the electric furnace and is mixed with the charcoal. In this way the heat available in this gas will be utilized, and an economy in the working of the furnace may be expected.

In view of the importance of reducing the consumption of fuel and electrical energy to the lowest possible point, the writer has calculated what could be expected in this way if the gases arising from the reaction between the charcoal and the ore were used partly for the reduction of the ore and partly for preheating the ore. Such a result could be attained in a furnace consisting essentially of three parts. In the upper part the otherwise waste gases are burned by air introduced there and communicate their heat to the incoming ore to which the fluxes, but not the charcoal have been added. In the middle portion of the furnace the gases arising from the lowest portion, which may be considered to be wholly carbon monoxide, react on the heated ferric oxide, if that were the variety of ore to be treated, and reduces it to ferrous oxide. The charcoal is introduced in the lowest section of the furnace and completes the

reduction of the ore to metal. Electrical energy is introduced into this section of the furnace and serves to melt the resulting pig iron and slag, and to supply the heat necessary for the preceding chemical reactions. The details of the construction of such a furnace have not been worked out at present. In a furnace of this kind it can be calculated that one ton of pig iron can be obtained from an everage ore by the use of 0.2 h.p. years of electrical energy and about 600 to 800 pounds of coke or good charcoal. This includes a reasonable allowance for loss of heat. A further allowance should be made for irregularity in the use of the electrical power and, taking this into account, we may consider that one-quarter of a h.p. year and 600 to 800 pounds of coke or charcoal wuold be required for one long ton of pig iron from the ore.

Considering these figures, it will be seen that the use of 1-4 electrical h.p. year will save about 2-3 of a ton of coke, or that 1 electrical h.p. year should not cost more than 2 2-3 tons of coke, if the electrical furnace is to compete with the blast furnace. Thus, an electrical h.p. year, at $12.00 would correspond to coke at $4.50 a ton. The considerations previously mentioned in regard to the use of cheaper fuel and cheaper ore in the electric furnace would also apply in this case, and with improved design and construction thesize of the electric furnace may be increased so as to admit of a large and economical output of pig iron.

Electric smelting plants on a small commercial scale have been put up at Welland, Ontario and Baird, California. While very little has been heard of these, the writer understands that at Baird, considerable difficulties have ben met with in the operation of the furnace. No doubt these difficulties will ultimately be overcome. No attempt has been made at present to utilize the waste gases, but this point will be attended to later.

The direct reduction of steel from the ore has been carried out by Stassano and others, but no economical scheme for this purpose has ever been put into operation on a large scale. The Stassano furnace consists of a chamber, about one metre cube, lined with magnesite bricks. The ore, mixed with the necessary fluxes and charcoal for its reduction and made up into briquettes, is placed in this chamber, and is heated by an electric arc, which is maintained above the ore. In this furnace it is possible to reduce the ore to metal and to remove any impurities, such as sulphur and phosphorus, although Stassano did not actually demonstrate this as the ores he employed were very pure. The method of heating the ore is, however, uneconomical, and it was not to be expected that commercial results could be obtained. Stassano still experiments with his furnace, but no longer uses it for direct reduction of the ore.

Steel has also been obtained directly from the ore by Dr. Héroult in his electric steel furnace mentioned in the early part of this paper, but he found the process uneconomical and preferred to use pig and scrap as the materials for making steel in his furnace. Experiments in the laboratory have been made at different times with a view to the difect reduction of iron ore to steel. In this connection may be mentioned the experiments of Messrs. Brown and Lathe in the Metallurgical Laborratory, at McGill, which were described in the last number of the "Institute Journal." These experiments are being continued this year and the writer hopes to be able to communicate some interesting results at a later date.

In operation for the direct reduction of iron ore to steel the following difficulties should be borne in mind:—

1. The difficulty of eliminating sulphur, when this is present in the ore, the blast furnace producing pig iron being far more efficient in this particular than a steel furnace, such as the open hearth. It may possibly be necessary on this account, only to use ore that are relatively free from sulphur in the direct production of steel.

2. Another difficulty lies in the different conditions required for the reduction of the ore and the final refining treatment to which the resulting steel must be subjected. Thus the operation of making steel must always be intermittent in character, while the reduction of ore in the blast furnace is a continuous operation.

Until these and other difficulties have ben overcome, it is not likely that we shall have any successful producion of steel directly from iron ore on a commercial scale. Nevertheless, the high price of steel as compared with pig iron renders this proposition particularly attractive to the electro-metallurgist. At present the most satisfactory method appears to be that of reducing the ore to pig iron in one furnace, and turning this into steel in a separate furnace as in ordinary metallurgical practice.

MEERSCHAUM IN NEW MEXICO.

For more than a century meerschaum has been extensively used in the manufacture of pipes and cigar holders, the principal source of supply for the material being deposits in the plains of Asia Minor, about 120 miles southeast of Constantinople. These deposits are said to have been worked for other uses for more than a thousand years.

The German name meerschaum "sea foam" is paralleled in French by "écume de mer," which may be less beautifully translated "scum of the sea." The mineralogist will tell you it is sepiolite, a hydrous silicate of magnesia, but this designation will not diminish the smoker's enjoyment of his meerschaum pipe.

The ease with which meerschaum can be carved, its whiteness, and the fine polish it takes with wax render its especially suitable for elaborate carving and artistic treatment in the manufacture of pipes. These pipes are prized for the rich cream-brown or brown color that the bowls assume after being smoked a while. This color is caused by the permeation through the meerschaum of the mixture of the nicotine from the tobacco with the wax used in polishing the pipe. As long as there is absorbed wax in the meerschaum the color of the pipe will grow darker and with continued smoking will become nearly black. It is therefore necessary to "fix" the color of the pipe when the proper shade is reached. The method employed to accomplish this is in part a trade secret.

The manufacture of meerschaum into pipes is a thriving industry in parts of Germany and Russia, employing more than 3,000 workmen. It is said that the supply of meerschaum for this industry is becoming low, and the discovery of deposits of the mineral in New Mexico is therefore interesting.

Two deposits of meerschaum have been located in the upper Gila river valley, one about 23 miles east of north of Silver City, the other at a mine about 12 miles northwest of Silver City.

Mr. Douglas B. Sterrett, of the United States Geological Survey visited the mine in October, 1907, and

has prepared a report on the deposit there which has just been published by the Survey as a part of an advance chapter of Bulletin No. 340, "Contributions to Economic Geology, 1907." The deposit lies in the bottom and walls of the canyon of Bear Creek, occurring in veins, lenses, seams, and balls in limestone in both nodular and massive form. The nodular meerschaum thus far tested contains iron stains and particles of grit and is inferior to the meerschaum of Asia Minor. The more compact, massive material may perhaps be found free from stains and of better quality.

Mr. Sterrett's report sketches briefly the geological relations of the deposits, describes the mode of occurrence of the meerschaum, and presents the results of chemical and physical tests and analyses of the mineral.

The pamphlet containing the report may be had on application to the Director of the Survey, at Washington, D.C.

DESCRIPTION OF THE MONTANA-TONOPAH COMPANY'S MILL.

(Written for The Canadian Mining Journal.)

The ore from the mine is dumped into a steel ore bin at the head of the shaft and is drawn therefrom through an ore bin of the counterbalanced type into a No. 5 Gates styles "K" breaker. This crusher is set to crush all to pass a 2 inch ring. The product is delivered to a No. 5 "B" Gates continuous bucket elevator, which elevates and discharges same into a Gates 40 inch by 12 foot iron frame revolving screen without internal spiders and having 1 inch perforations. The product passing through the holes is delivered directly to the conveyor for transportation to the mill. The oversize which does not pass the hole is delivered by gravity to the two No. 3 style "D" Gates crushers. These crushers are of the special short head type for fine crushing and are set to make a product which will pass a 3-4 inch ring. The product of these crushers is also delivered to the conveyor above mentioned.

The ore now being all reduced to about 3-4 inch size, is conveyed by a travelling belt conveyor having a belt 14 inches wide to the mill building. This conveyor is about 194 feet long and travels up an incline of about 40 feet in this distance. At the entrance to the mill building this conveyor discharges the ore on to another conveyor of the same size and type, but operating in a horizontal plane at an angle of 30 degrees from the line of the other and it is about 91 feet long. This conveyor is provided with an automatic tripper or distributor, which travels along the length of the ore bins in back of the batteries, delivering the ore automatically into the bins the entire length.

At the point where the ore is discharged from the first conveyor on to the second there is installed a Cole automatic sampling device to take a sample of the crushed ore. This is very ingenious and about the best devised sampler that is made for ore discharged from a belt conveyor. Mr. D. Cole, assistant manager of the Cananea Cons. C. Co., made the first design and installation of this sampler at their mills, and it has proved a great success. The arrangement is such that a cutter or sample scoop is made to pass through the ore stream and take a sample across the full width of the belt during its passage. The frequency of the sampler can be arranged for in the driving mechanism.

The crushed ore is drawn from the bins back of the batteries through ore bin gates into the automatic feeders, which are of the suspended or hanging type, which can be moved back from the mortars when necessary thus giving a large working space for making the usual repairs. There are eight bin gates and feeders, one for each battery.

There are forty stamps, weighing about 1,050 pounds each. They are arranged in eight batteries of five stamps each in a mortar and each battery is driven by a belt and tightener from the countershaft. The batteries are made right and left hand, set in three-post frames. The mortars are of the narrow rapid crushing, quick discharge type, and the principal battery parts are steel to insure maximum wearing life. The ore is crushed through 12-mesh screens on the mortars.

The pulp from each five stamp battery is delivered to a 24 inch cone classifier or sizer, which makes two products. The spigot, or coarse product, of each is delivered to a Wilfley concentrating table, of which there are eight in all, and the overflow from each cone is delivered to the two Dorr classifiers. The tailings from the Wilfley tables are also delivered to the Dorr classifiers by belt and bucket elevators, which are made necessary on account of the contour. In the Dorr classifiers a separation of the sand and slimes is made mechanically. It is aimed to crush all the pulp to one hundred mesh and finer in the tube mills, and these classifiers separate that part of the pulp which is already crushed to this size and it is delivered to the thickening cones for concentration on vanners, as later mentioned. The coarse sand product from the Dorr classifiers is delivered into two 5 foot by 22 foot Gates trunnion type wet grinding spur gear driven tube mills. These mills are provided with silex flint brick linings 4 inches thick, and the initial charge of pebbles for each mill is 10 tons. The sands are all ground to 150 mesh or finer in these mills and each mill discharges its product into a classifying cone 4 feet diameter. These cones are for the purpose of separating any sands from the product which might have passed through the mill without being reground fine enough, and the sands are elevated back to the Dorr classifiers to be again fed to the tube mills. The finished product is delivered to spiral sand pumps, by which it is elevated to 2 large settling or pulp thickening cones, where with the excess of water removed it is sent to the cyanide plant. The thickened pulp from the bottom discharge is delivered to 16 standard frue vanning machines or concentrators having endless rubber belts 6 feet wide. These concentrators remove and collect any fine sulphides after regrinding, in addition to that saved by the Wilfley tables. This concentrate pro-

duct is collected and dried, after which it is shipped to the smelters.

The tailings from the vanners and the overflow from the settling cones are delivered to any one of three dewatering tanks in the cyanide plant. These tanks are provided with filters through which the water is drawn off and flows to a final settling box to collect any slimes carried in suspension, after which it is delivered to a water sump tank to be pumped back for re-use in the mill.

The thickened and dewatered pulp from the settling tanks is drawn off from the bottom discharge through a pipe line connected to the suction of a centrifugal pump. This pipe line is arranged so that the contents of any tank can be drawn off and a cyanide solution pipe is connected up with same to introduce solution if desired. The pulp is delivered by the pump into the agitator tanks. There are six agitators of the Hendryx type for treatment of the pulp, this number being required on account of the predominating value being silver and requiring about 24 hours to bring same into solution. After the required period of agitation the pulp is drawn from these tanks by a centrifugal pump and delivered into the pulp storage tank. This tank is provided with a stirring gear which keeps the pulp in gentle agitation to prevent same settling. From this tank the charges are drawn into the filter tanks as required.

The filter system used for removing the solution from the pulp is the Butters Vacuum System, consisting of two filter boxes, each containing 72 filter leaves. A charge of pulp is delivered to the filter box and after removing the solution by a vacuum applied to the filter leaves and following with the necessary washes, the pulp is discharged through the bottom from the filter leaves, and is sluiced out to waste. The solution is collected in a small storage tank and is pumped through a clarifying filter press into anyone of three precipitating tanks.

Precipitation is effected by means of zinc dust introduced in the form of an emulsion and with agitation by compressed air until the cycle is completed. The contents of the precipitating tanks are pumped up to the refining plant and the precipitate is collected by passing the material through filter presses where the precipitate is collected on the filters in cakes and the solution is delivered to the storage tanks for re-standardizing and used again. The cakes collected are dried and shipped to the refineries for reduction to bullion.

The mill is driven throughout by electric motors, and these motors are distributed so as to give unit drives to the various departments. The current used is bought commercially and is 60 cycle, 3 phase, 440 volts, transformed down from 6,600 volts and distributed from the main switchboard to the various motors located at the different points in the separate buildings. The motors are of the Allis-Chalmers standard induction type, and this company furnished all the electric equipment, including transformers, switchboards, etc.

The plant is arranged in separate buildings to conform to the contour of the country and also for protection against fire.

The elevators and pumps for handling slimes, solutions and water are installed in duplicate to insure against stopping of the entire plant when making necessary repairs to these machines.

The capacity of the mill is rated at 200 tons per day, and the crushing plant is capable of handling double this capacity in a single shift if necessary. A remarkable feature of this plant is the short time consumed in building it and placing it in successful operation. As soon as power was available for operating the entire mill after its erection, it was placed in daily operation and handled the rated tonnage practically from the start. The details had been worked out so completely in every point that the entire plant was a success commercially, metallurgically and mechanically from the start.

The plant was designed by the Allis-Chalmers Company under the able direction of Mr. F. L. Bosqui, consulting engineer for the Montana-Tonopah Mining Company, to whom full credit is due for its immediate success.

THE ASSAY OF SILVER ORES.

W. K. McNeill.*

The writer has been asked to follow up his former article by another dealing with the silver assay in detail.

The pyro-chemical method for silver and gold has been found necessary owing to the fact that the metals are found disseminated through the rock or gangue in such relatively small quantities that the ordinary gravimetric method is out of the question, both on account of the large quantity of ore that would have to be operated on, and because of the time consumed in such an operation.

The processes of the silver assay consist in (a) roasting; (b) crucible fusion and scorification; (c) cupellation.

The first is to remove any sulphides which the ores contain, but it must be remembered that in the ores such as those of Cobalt, if they contain smaltite or niccolite, they cannot be subjected to this process. By a series of careful experiments, it has been found that in the volatilization of the arsenic there is a great silver loss. This process, then, can be entirely omitted in the characteristic Cobalt ores.

Crucible Fusion.—Weight of ore, one-quarter to two or more assay-tons, depending on the supposed richness of the ore.

The ore is previously ground to a very fine powder, and the metallics removed and assayed separately, as they cannot be so mixed with the powder as to make a homogeneous sample. To the weighed portion of ore is now added a charge of standard flux, litharge, silica, assayers prefer to use as a reducing agent sulphide of and some reducing agent, such as argols or charcoal. Many iron, but this does not give as good results as the argols; although, if the ore is pyritic, the amount of reducing agent may be decreased, so as to utilize the pyrite and give the desirable size of lead button (15 to 25 grams).

A great many assayers invariably dispense with roasting, and estimate the reducing power of the ore. They then add enough reducing agent to give the required weight of lead and if the ore is very rich in reducing agents enough nitre is added to neutralize the excess

*Manager Canadian Laboratories, Toronto, Ont.

But generally the assayer depends on his own appraisal of the ore, estimating the general composition and making up a flux that will be fusible at redness to a mobile slag. If the ore is silicous, containing quartz or silicates, then add iron soda carbonate to the standard. If the ore is more basic, then add silica, and if decidedly basic then the charge can be mainly litharge and silica.

A few points are worth noticing here:—

(1) The litharge should be tested for silver.

(2) If the charge "boils," owing to an excess of silicates, it should be put into a very hot muffle at first.

(3) Nails should be added to combine with any refractory pyrite.

(4) The charge should be thoroughly mixed.

Scorification.—In this process, used altogether for cobalt and nickel bearing ores and metallics, the charge of one-tenth assay-ton is mixed with ten to fifteen times its own weight of test lead free from silver, and thoroughly mixed, and a small quantity of borax glass added. If, as stated before, a small film of litharge is placed over the charge in the scorifier, it will improve the operation. The assay should be placed in a hot muffle. The causes of "bumping" have been previously mentioned. If slag becomes too viscid it can be remedied by the addition of some glass slag saved from crucible work.

Cupellation.—This operation depends on the facts that lead is easily oxidized by air, and that the precious metals resist oxidization even at a high temperature, although silver will steadily oxidize in the muffle during cupellation if the temperature becomes too high.

The cupel is made of "bone ash," or "cement." Experiments on these two substances show that bone ash is slightly more rapid than cement, and that it will at ordinary cupelling heat absorb the last traces of lead better. But cement, on the other hand, will absorb as well if, during the last stages, the temperature of the furnace is increased. They also have the advantage of being cheap and durable.

The process for the "scales" or metallics is outlined in all text-books.

In all silver assaying a great many duplicates should be run if any exact results are to be obtained. It is also advisable to correct for volatilization. For exact work, also, the combination of wet and dry methods is perhaps better, the ore being dissolved in the usual way and the silver precipitated as a chloride. The residue from solution is carefully assayed for silver as well as the precipitated silver chloride. This item was omitted by a writer in the *Engineering and Mining Journal,* hence accurate comparisons could not be obtained.

A splendid device for even cupelling in a furnace, when the heat is uneven, is the "cooler," an iron plate which can be held over the cupels and withdrawn when the temperature lowers. By this method all the assays can be "feathered."

SALT RESOURCES OF SUSSEX, NEW BRUNSWICK.

Present indications point to a scientific and systematic development of the salt resources of Sussex, King's County, and the vinicity. From Havelock to Salina, or Salt Springs, the entire series of valleys are abundant in salt springs varying in density of brine. A boring of some seventy feet was made several years ago (no log of boring has been kept), and the brine overflow from this boring tests one hundred per cent. more than the surface brine that had been used for nearly a hundred years, during which salt had been made from these springs, and in some instances the product has been found to be particularly pure, having been used largely for dairy purposes. Up to the present only the most primitive methods have been employed in making salt, the brine having been boiled in the ordinary cast iron pots, thus entailing a very large waste of fuel. The principal operations seem to have been carried on at Plumeseep, on what is known as the old Kendrick property, where, in all, seven springs have been located. Most of these have been tested and show an average strength of twenty per cent. The origin of the springs is a mystery, and with a view to solving it an English concern has been organized with a capital of £50,000, and there is every prospect of heavy development being carried on within the coming year.

Dr. R. W. Ellis, of the Geological Survey, visited the springs last summer, and as a result of an examination was very favorably impressed with their possibilities and recommended that boring be begun to test the origin of the flows. This will be carried out in the near future and it is fully expected that large secondary deposits will be discovered.

It may be of interest to note here that the waters flow close to a fresh water stream, and travellers are frequently surprised on finding it saltier than sea water.

It is the intention of the parent concern, which controls the Kendrick property, to send over one of its directors, who will make a fuller examination of the situation, and, in the event of a favorable report from him, it is probable that next summer a large sum of money will be expended in the vicinity. Other parties are interested in the location of salt deposits, and the right to bore will be acquired. Should a salt bed be located, there is a very strong possibility, it is believed, of building up an industry that will hold an important position in the development of the trade of the province.

The concern organized to carry on the manufacture of salt is known as the New Brunswick Canadian Salt Company, Limited, with its head offices in London. The Canadian solicitor is Walter H. Trueman, of St. John, and Harold D. Buchanan is resident manager.

Considerable has already been accomplished in the establishment of the plant. The installation of two large vats, into which the brine flows to be reduced to a proper saturation, and the placing of the boilers for the reduction of the salt to crystalline form, have been done with a view to the use of every particle of heat. The system, which is a new one, provides for the passage of all flame used under the boilers through tubes extending back under the evaporating vats. Thus the heat produced does double duty, and, to a large extent, solves the problem of cheap fuel, the most important factor in salt manufacturing. The intention is to install

about thirty additional vats and boilers, should the company's experience in its later development work prove satisfactory. This will give a capacity of many barrels daily. Favorable reports have been received, but until the diamond drills are sent below, the real test will not be known.

If salt beds are discovered it will be almost a guarantee of immense areas of salt located in the province.

The large salt beds of Michigan, where most of the salt consumed in the neighboring republic is manufactured, extend for hundreds of miles and are practically inexhaustible. The Canadian beds at Goderich are also of great extent, being controlled largely by the Canadian Pacific Railway. On both sides of the border the same methods are employed to bring the salt to the surface. After the holes are sunk they are piped and then water is forced down and pumped up after it has been properly saturated with brine. These solutions are very dense and produce a painful sensation when brought in contact with the tongue.

Everything of course depends on what is known as the secondary deposit of salt. If the brine comes from the bowels of the earth, it is impossible to reduce it with anything like a proper margin. As the waters of the spring rise, they come into contact with the surface drainage and thus are reduced in saturation and can only be brought back to their original strength by the use of fuel. The condition is equally true of the flows from the initial and secondary deposits, but where the latter are encountered the modern methods of pumping overcome this difficulty and gives a brine with sufficient saturation to enable the operator to place it in the vats at once.

One cannot overestimate the importance of a discovery of secondary salt, with the great Maritime Province markets at hand. Transportation would be reduced to a minimum and the price of fuel very low at the point referred to.

After years of experiment, something is proposed which will either shatter the most sanguine hopes, or gives to Sussex and its vicinity industries that will mean a large annual distribution of money in wages. At present the suggestion of the existence of salt beds is regarded with optimism, and if they do there is big money in store for the fortunate finder.

Should no boring be done (which is very unlikely), a good profit can still be made with the company's new system of evaporation. Compared with the old pot and pan method, at least eight times the quantity of salt could be produced with the same amount of fuel, and it is claimed that the old method was a paying proposition.

WORLD'S GREATEST GOLD PRODUCER.— RECORD WORKING COSTS.

(Special to Canadian Mining Journal.)

The Robinson gold mine of the Rand, which achieved the wonderful record of producing £1,290,461 in gold and distributing £660,000 in dividends during 1907, has further distinguished itself by a reduction of working costs to a level below the most optimistic anticipations of a few years ago. During the recent period of financial distress, when yields and dividends have been steadily rising and the support of European investors as steadily weakening, there has been a call, one may say, a clamor, for cost reduction upon the Rand which has necessitated the sternest reorganization of methods. Wages have been reduced and in every department of work, technical and clerical, a standard of economy instituted before unknown. The demand for higher efficiency has been satisfied by modifications of metallurgical system of an order that is revolutionary for the Rand. By means of tube mills for regrinding the coarse mill products, stamp duties have been raised to 8 and 9 tons per diem and the gold recovery to 96 per cent. These figures are, of course, high above the field's average, but gradually the less efficient mines are being brought into line and the whole aspect of Rand metallurgical performances reflects the great industrial importance of the reform.

The tendencies of underground economy are yet difficult to foretell. Chinese labor is being rapidly repatriated; Kaffirs are now offering themselves for work in unwonted abundance. But the cloud of future uncertainties, owing to the variability of the native supply and the prospects of Government legislation extending to the systems of labor allocation underground, still hangs heavily upon the industrial horizon.

With a monthly total of ore milled of 1,350,000 tons, the Rand cannot speedily reflect changes of a current expenditure. The reduction has been slow. The average for the field has been gradually reduced to under 20 shillings per ton milled, which represents only 85 per cent. of the rock hoisted, owing to "waste" elimination at the head gears. Before the war, an average of 24 shillings per ton was recorded. Many companies, however, are now operating for 17, 16 and 15 shillings per ton, with a fair allowance for development charges.

The record was attained by the Robinson mine in December, 1907, when the total working expenditure touched 14s. 1.18d. per ton milled. I have been favored by Messrs. Eckstein & Company's Central Administration with a detailed analysis of expenditure, which stands as follows:—

(210 stamps ran 28.75 days, crushing 40,000 tons.)

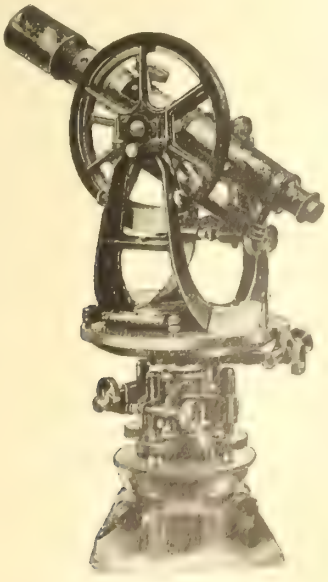
	Cost per ton. s.	d.
Mining—		
General		7.22
Stoping	4	6.95
Timbering		3.81
Shovelling and tramming	1	4.73
Winding		9.39
Pumping		2.61
	7	10.71
Reduction—		
General		0.72
Ore sorting		3.09
Ore crushing		2.56
Ore transport		3.13
Stamp milling	1	3.68
Tube milling		4.31
Cyaniding pulp	1	2.15
Discharging residues		7.22
	4	2.86
General expenses—		
Mine		11.00
Head office		5.17
Development		7.44
Total working expenditure	14	1.18

The rock hoisted and delivered to the sorting station during the month totalled 48,460 tons, of which 8,560 (17.664 per cent.) were sorted out. The number of whites in the employ of the company was 319, and of natives 3,019; there were also 94 Cape boys and Indians.

Although the Robinson heads the list of gold producers, its crushing capacity is far below that of its nearest competitor, the Simmer and Jack. This mine, belonging to a different group, crushed, with its battery of 320 heads, 736,930 tons during 1907 for a yield of £1,187,634.

Small batteries no longer form part of the Rand's industrial designs. The joint Simmer East-Knights Deep mill is of 400 head capacity, that of the Crown Deep-Robinson Central Deep 300, and that of the Robinson Deep also 300 heads; all these with duties of 6, 7 and 8 tons per stamp per day.

A new mill is being erected for the Simmer Deep-Jupiter, of 300 stamps, which will be built mostly of steel and will employ stamps of 1,670 pounds weight, with mortar box allowance for an increase to 1,800 pounds. The sands and slimes vats to serve this plant will be no less than 50 feet and 70 feet respectively in diameter.

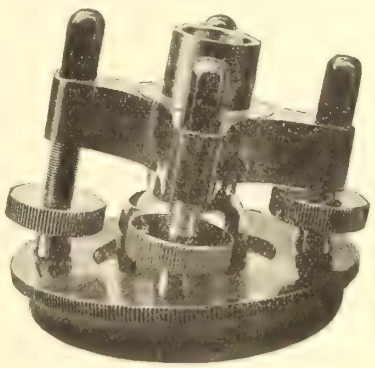


From such figures as the above can be learned the true significance of the Rand's modern policy of "large scale operations."

Ralph Stokes.

Johannesburg, February 20th, 1908.

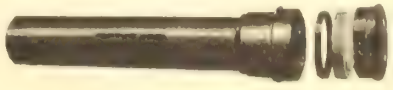
A NEW THEODOLITE.



We show below an illustration of an improved theodolite recently placed on the market by Wm. Ainsworth & Sons, the well-known instrument makers, of Denver, Colorado.

The instrument is designated as their Type BU, and has ten inch twenty-five power telescope with one and one-fourth inch objective, five inch full vertical circle, guard and vernier reading to one minute, thirty seconds telescope level, stadial and gradienter five inch limb with verniers reading to one minute at 30 degrees angle with telescope.

The construction of the standard is such that it admits of placing a two and one-half inch compass in the centre, which answers very well for checking courses; most surveys now being made from a meridian established by solar observation; and for rigidity and permanence of alignment the U standard is far in advance of the usual construction.



All clamp and tangents are of the gib type, which when properly constructed are superior to the split clamps formerly used, in that they do not carry the instrument off the line when clamping. The convenience of our limb and lower clamp and tangent screws can be appreciated from the illustration.

The principal parts are made of the hardest bronze alloys to limit gages and interchangeable to the highest degree; the makers guaranteeing that any of the parts excepting the limb, vernier plate and centre can be interchanged with other of their instruments of the same size without throwing the instrument out of collimation to exceed fifteen seconds.

One of the advantages resulting from the use of gages is shown by the leveling head, which cannot be cramped in any position, and whereas usually when leveling up an instrument it is necessary to loosen all four of the screws to prevent cramping, this is not the case where all parts are made accurately to gages and carefully inspected after each operation and before assembling. The cramping of the leveling head increase tenfold the wear on the leveling screws and on lighter construction occasionally cramps the centre, this being the greatest objection to the four screw or American type of leveling head by engineers.

Another of the excellent features of this instrument is the telescope construction, wherein accurate limit gages also play a very important part. The main telescope tube is finished inside and out by lapping, as is also the outside of the draw tube to within .0001 inch of standard dimensions. The inside of the objective head, the outside and inside of the lens cell and the periphery

of the objective are all of uniform diameter, true and accurate to within these limits. The makers guarantee these as well as other parts of the same size instrument to interchange with a resultant error in collimation of not to exceed the above amount.

EXCHANGES.

The Iron and Coal Trades Review, March 6th.—Commenting upon the mineral production of the United Kingdom in 1907, the *Review* has this to say: "During 1906 the upward movement of the market was slow and limited. It is true that in 1907 the continued and extraordinary expansion of trade had its effects upon prices, and coal became much dearer; but it must be remembered that the industries of the country generally had enjoyed a long term of unusual prosperity before the coal trade began to enter into its own."

Bulletin of the Imperial Institute, Vol. V., No. 4.—A highly instructive summary of the occurrences and uses of tantalum appears in this number of the *Bulletin.*

Metallic tantalum has come into prominence through the discovery of its suitability for the preparation of filaments for incandescent lamps. The commonest ores of tantalum are tantalite and columbite, which consist of tantalates and niobates of iron and managenes in varying proportions. Tantalite contains 84 per cent. of tantalum pentoxide, whilst columbite contains but little tantalum and is mainly composed of niobic pentoxide, a practically worthless and often detrimental constituent.

Tantalite is black in color, has a composition formulated thus (Fe, Mn) Ta_2O_6, in which manganese frequently replaces the iron, and tin, zirconium or niobic oxide takes the place of the tantalum. Streak is black, hardness 5 to 6.5, and specific gravity 6.5 to 7.3. It crystallizes in the orthohombic system.

There are many other tantalum-bearing minerals; but they are not of commercial importance.

Tantalum minerals are found principally in the eastern part of the United States; in the tin-bearing districts of the Northern Territory of South Australia; and in West Australia. The American minerals range from 18.20 per cent. to 78.20 per cent. tantalic pentoxide. South Australian samples show 41.70 per cent. and 55.52 per cent.; West Australian, 50.57 per cent. to 80.61 per cent.

The ores are bought on a basis of at least 60 per cent. of tantalic pentoxide. Niobium oxide should not exceed 3 per cent. Chromium should be entirely absent. The price is stated to be about 4s. 6d. per kilogram of ore.

Tantalum is extracted from its ores by means of conversion into the alkali fluoride, which is then acted upon by metallic sodium.

The pure metal melts at 2200 degrees C. Its hardness is 10 and its specific gravity 16.5 to 16.6. Although ordinarily ductile, under hammering it becomes extremely hard.

Its principal uses are its application as an incandescent filament and as an alloy. It has been proposed to use it in place of platinum for laboratory purposes. Since it is attacked by hydrofluoric acid and by fused alkali and since it oxidizes when heated in air its usefulness would be limited. However, it has the advantage of being unattacked by aqua regia.

The Journal of the Chemical, Metallurgical and Mining Society of South Africa, January, 1908.—Mr. W. A. Caldecott, B.A. F.C.S., has an article on Mexican silver ore treatment in this number of our South African contemporary. "Some Features of Silver Ore Treatment in Mexico" is the title of the paper. Part I., which appears in this issue, takes up "Works Practice."

Cheap power and the replacement of the old patio process by cyanide treatment have made the remarkable advance in Mexican silver ore treatment methods possible. Power is being transmitted as far as 170 miles and supplied at a cost of 30s. per horse-power per month, considerably less, the author notes, than the average cost of electric power on the Rand.

The patio process, invented at Pachuca by Bartolome de Medina in 1557, although still in operation, is mainly of historic interest. Cyanide leaching preceded by a chloridizing roast is also a thing of the past, as also is hyposulphite lixiviation.

Mexican unskilled labor is cheap, costing about 1s. 6d. per day; but its cheapness is offset by its irregularity. In the city of Mexico there is an electrolytic refinery for gold and silver bullion. The metric system is generally used in dealing with Mexican silver ores. Cyanide consumption is expressed in kilograms per metric ton of 1,000 kgm., or 2,204 lbs.; and silver or gold is reported in grams per metric ton.

Mexican silver ore is usualy a hard, flinty, quartz containing little extraneous base metal mineral. Silver occurs mostly as silver sulphide, associated at times with a little arsenic or antimony. Silver chloride and native silver are comparatively rare. A small but important amount of gold is found with the silver. As a rule the gold is more readily extracted by cyanide treatment than the silver, and thus it requires no special attention.

Fine grinding, cyanide treatment, decantation followed by mechanical filtering and zinc shaving precipitation are the essential features of modern Mexican practice.

The uniform dissemination of finely divided silver-bearing minerals in the ore render finer crushing necessary than is usual on the Rand. Stamps followed by tube mills represent the most advanced practice; but at a Guanajuato plant stamp milling alone with slotted screens equivalent to 45 meshes per linear inch, serves to slime the ore. This, however, reduces the duty per stamp to 2.7 tons per 24 hours. At Pachuca, stamps are followed by chilian mills crushing to 80 mesh.

The Mexico mill of El Oro Company is equipped with forty stamps and six 4 ft. x 20 ft. tube mills. The 16-mesh battery product from 200 tons of hard, flinty ore per day is reduced to a product, 90 per cent. of which passes a 200-mesh screen. Developments at this plant will go far towards determining whether making 50 per cent. to 75 per cent. slimes and corresponding quantities of hard and tough fine sands, or sliming all the ore is the most economical method. This hinges on the actual cost of all-sliming.

Trials are now proceeding in stamp milling without battery screening but with a high slot discharge on the lines of the old German schubersatz.

Amalgamated copper plates are not generally used in Mexican plants, but following the stamps and sometimes the regrinding appliances as well, Wilfley or other concentrators are employed. The concentrates are usually shipped to a smelter, together with a certain amount of hand-picked ore.

Sand is commonly separated in vats from the pulp, leaving the battery by Butters distributors, and long sand treatment is usual. The slow rate of solution of the cyanide renders lengthy agitation and aeration necessary in slime treatment.

In addition to the use of strong solution in slime treatment a good deal of lead acetate is added, varying from 4 ounces to 12 ounces per ton of dry slimes. The strong solutions used and the considerable weight of silver to be precipitated cause the employment of coarse zinc shavings, for which lead-coating is not needed, as the zinc-silver couple soon formed yields a high precipitating efficiency. For smelting the silver, often amounting to one ton per month at individual plants, crude oil furnaces are employed.

The cyanide consumption ranges from two to four pounds per ton of ore and the percentage recovery of silver from 70 to 90 per cent. A higher recovery of gold is made.

Ore treatment charges run from $1.95 to $3.00 per ton of ore.

PERSONAL AND GENERAL.

Mr. James Ross, president of the Dominion Coal Company, is at Atlantic City.

Mr. E. P. Earle, president of the Nipissing Mines Company, was in Ottawa recently.

Mr. W. A. Carlyle has completed his examination of Le Roi mine and is now returning to London, England, to report to the directors of the company.

Sir William Armstrong has been investigating the Sudbury nickel deposits to ascertain their value as a source of supply for the armor of war vessels.

Mr. E. C. Wood, of Spokane, is in Kamloops. Mr. Wood will resume his practice as a mining and civil engineer. He was formerly a resident of this city.

Mr. John Hayes Hammond, the noted mining engineer, who has been ill in San Francisco for some months, has now fully regained his health and will shortly return to the East.

Lieutenant-Governor Dunsmuir of British Columbia is negotiating with British capitalists for the sale of his Vancouver Island coal mines and other business interests, with a view of residing in England.

Boston capitalists have acquired from Mr. James Amess, of Vancouver, a dredging concession in the Fraser river near Lillooet and organized a close corporation to operate it under the title of the Boston Gold Mining Company.

Dr. Victor S. Clark, who has been traveling through Canada making a special investigation for the Washington Department of Commerce and Labor as to the workings of the Lemieux Industrial Disputes Act, was in Cobalt about the middle of last month.

Mr. B. A. C. Craig left Toronto on the 23rd March for Saskatchewan. He will be absent for some weeks. Mr. A. Crawford Craig is in Saskatchewan now. His brother will join him there. The two Messrs. Craigs are interested in the mineral deposits of the new province.

Prof. J. J. Thomson, of Cambridge, Eng., has been nominated by the Council of the British Asociation for the Advancement of Science as president of the meeting to be held at Winnipeg next year. He took his degree of D.Sc. from Dublin, Victoria and Columbia Universities and is a Ph.D. of Cracow. He became an F.R.S. in 1884 and is known as the author of several standard scientific works.

WATER IN GRANITE.

The very general belief that wells sunk in granite will get no water appears not unreasonable when we consider that granite is the hardest of rocks and that its surface outcrops are as a rule so free from pores or crevices through which water might circulate that the expectation of finding water by drilling would seem absurd. Within the last few years, however, the many succesful wells drilled in crystalline rocks have effectively proved the erroneous character of the old opinion.

The crystalline rocks, such as granites, gneisses, schists etc., like the sedimentary shales, limestones, and sandstones, carry water in their pores—the microscopic spaces between the grains of solid mineral matter; but while the sedimentary rocks may absorb several per cent of their volume in water—sandstones about 15 per cent, limestones 5 per cent, and shales 4 per cent—granites and other crystalline rocks rarely absorb water to more than one-half of 1 per cent of their volume, and the water in such rocks moves through the pores so slowly that it can never escape fast enough to be of value in wells. Fortunately, however, the crystalline rocks are traversed in various directions by many joints and crevices. An investigation of these joints shows two principal systems, one of which is nearly vertical and the other horizontal. The vertical joints, which may be hundreds of feet in length, while not at all regularly spaced, are usually 10 to 20 feet apart, trend in all directions, and may be inclined to the vertical at any angle up to 30 degrees. The distance between the horizontal or sheet joints, which approximately parallel the surface, varies from a few inches near the surface to many feet at a depth of several hundred feet below.

The nearly vertical joints serve as channels for the admission of water from the surface, while the sheet joints form reservoirs for its storage. As most of the joints are rather narrow, the amount of contained water is likely to be moderate, and the yield of wells in granite is seldom more than 10 gallons a minute, though some exceptional wells, pumped by steam, have yielded as much as 30 gallons a minute. Out of 72 successful wells in southern Maine only 2 yielded more than 50 gallons a minute.

The extreme irregularity of the joint systems makes the success of any well in granite a matter of chance. Of two wells drilled within 50 feet of each other, one may be a failure, the other a marked success. Records collected in southern Maine indicate that about 87 per cent of the wells drilled in granite supply water enough for ordinary domestic uses.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay, 18th March, 1908.

Glace Bay is happy. Votes of thanks and congratulatory addresses have fallen around like "leaves on Vallambroso," and even on Friday, the thirteenth, the citizens of our smoky towns managed to smile. The Board of Conciliation made their award on the 12th of March, and it was accepted and signed by the representatives of the men and the general manager of the Coal Company on the following day. Although at no time during the negotiations between the Coal Company and their men was there any real fear of a strike, yet everybody is relieved at the removal of the incubus of uncertainty that has been with us since the end of November last. As stated in previous correspondence, the members of the Board were Prof. Adam Shortt, of Kingston University, Ontario, chairman; Dr. A. S. Kendall, M.P.P., men's representative, and J. Dix Fraser, of New Glasgow, the company's representative. The work of the Board commenced on Monday the 2nd, and it sat every day without intermission from 10 to 5 until the 10th. Professor Shortt proved an ideal chairman. The way in which he went to the heart of things evoked the admiration of all who were present at the sittings of the Board. His quick appreciation of fine technical points was remarkable. He quickly divested any disputed point of its haziness and laid the issue fair and square before the witnesses. Very evidently the professor has had considerable experience in work of this kind. Every little while he would treat the audience in the Council Chamber to a little dissertation on general principles, which he would proceed forthwith to apply with unerring directness to the particular point that then happened to be under consideration. It was soon seen that he could not be trifled with, and that it was impossible to lead him astray very far. Prof. Shortt carefully avoided any personal issue, and once or twice when signs of a little friction manifested themselves he made it very plain that such questions were entirely out of his province, and that all he was there for was to make as fair a settlement of wages as could be archieved. He was consistently courteous and impartially tactful, and possesses the happy knack of appearing to be deeply interested in every bit of evidence given.

The men presented their evidence in a very capable manner and in an eminently fair manner also. Their case was conducted by the Grand Secretary, John Moffatt; the Grand Master, Stephen B. MacNeil, and the Grand Outside Watch of the P. W. A., Sylvanus Nicholson, and these gentlemen proved themselves entirely worthy of the confidence reposed in them by the members of the P. W. A. Mr. Nicholson in particular proved himself to have quite extraordinary staying powers as a cross-examiner, and altogether the case of the men was presented with great ability.

The award of the Board confirmed the main features of Schedule No. 1 put into effect by the company on the 6th of January, with certain concessions to the men that mean an aggregate increase of about $70,000 per annum over the wages paid under the three years' contract. These increases are as follows: An increase to men in machine narrow work, to cover the increase to loaders and the increase in the price of powder. A scale of rates for mining coal in pillars graded according to the weight of the cover, which are an increase over the pillar rates under Schedule No. 1. The laboring rate remains at $1.52 according to Schedule 1, but an increase of two per cent. is given over Schedule 1 rates to boys, drivers and landing tenders, and to mine mechanics and shiftmen getting over $1.70 per day, bringing up the rate of skilled shift labor to $1.75 per day. The clauses relating to cross-cuts in pillars, and to wedging coal in pillars where the presence of gas rendered it unsafe to use powder which appeared in Schedule 1 were modified and simplified, as their former reading was a little ambiguous. The price of powder and house coal remains as under Schedule 1.

All agree that the award of the Board was a very fair one, and it will be seen that the differences between the men and the company were very small after all. The graded rates for pillar getting, while distinctly more favorable to the men, yet bear out the company's former contention as to the greater ease of mining pillars under deep cover compared with mining pillars under light cover. The settlement of the pillar cross cut question removes a constant source of friction and the uniform price for powder puts the sale of explosives on a more business-like footing than before.

The men and the company have agreed to the continuance of the rates of the award until 31st December, 1909, and we are therefore assured of at least two years of industrial quiet, which cannot but be of great benefit to every one concerned.

We think the P. W. A. are to be congratulated on their getting, and the Coal Company, on their ability to give, an increase of wages at the present time, when retrenchment and financial failure are of daily occurrence. We venture to think the miners of Glace Bay are about the only people on this continent who will get an increase of wages this year, unless all financial signs fail. We have no doubt, however, that the Coal Company will feel that freedom from labor troubles and the prospect of an uninterrupted two years of steady development are well purchased at the cost of the extra wages they are going to pay.

The Lemieux Act has certainly proved its worth as a means to conciliation, and once again we see that in many cases the differences between employer and employee are but slight, and more or less easily adjusted if an impartial tribunal, or rather a peacemaker, is available to bring them together. Men and masters are naturally more or less suspicious of each other and always seem to find it difficult to treat absolutely openly with each other. Whether we say the Lexieux Act is to be thanked or whether it is Professor Shortt that we owe our thanks to, we also think the easy settlement was largely due to the fact that there really was not much to fight in the Coal Company's Schedule 1, that it was very fair and very just.

An interesting visitor to the meetings was Dr. Clarke, a representative from President Roosevelt, who is interested in legislation for the States of a similar character to our Canadian Act. We think they need it.

We see that the Springhill lodges of the P. W. A. and one of the Cape Breton Lodges, namely, Olive Lodge of No. 3 Colliery of the Dominion Coal Company, have announced their intention to secede from the P. W. A. and join themselves to the United Mine Workers of America. "Whom the gods destroy, they first make made." Why should a Canadian labor organization wish to join hands with the union of men who belong to another nation, who live under laws other than their own. We think the condition of miners in Canada is quite as happy as that of the miners in the States. We wonder whether the men of Springhill ever have tried to realize what the Canadian nation is going to be some day? The miners of the States have evidently realized that, or why should they send their emissaries here to enlist Canadian in their forces? The ambassadors of John Mitchell are not consumed with anxiety for the welfare of Cape Breton or Nova Scotia. What they wish to do is to have a hold on the chief Canadian coal field, so that whenever they wish to force the hands of the coal operators in the States, they will be safe from Cape Breton coal imports to relieve the situation in their disfavor. The relations between the P. W. A. and the coal operators of Cape Breton have been almost patriarchal in their mildness. What other labor union in the world has its dues stopped through the colliery office? Some men are of the opinion that friendliness cannot exist between an organization of men and their employers.

and that capital and labor are necessarily and always antagonistic. They have a suspicion that mild relations mean weakness on their part, and that nothing is ever obtained without a show of hostility and a fight now and then. We venture to assert that they are woefully mistaken. Organization is as necessary to labor as it is to capital. If labor does not organize, it will suffer, and so will capital. But these organizations are not of necessity antagonistic, as a matter of fact it is trite to say that their interests are one and the same. Quite what benefit would ensue to the miners of Cape Breton if they threw over the P. W. A. and joined the U. M. W. A. we find it difficult to see. They might certainly pull somebody else's chestnuts out of the firt, but whose fingers would be burnt? We rather think the vote passed at Olive Lodge was a snap vote and did not represent the true feeling of the men there or anywhere else in Cape Breton. After the splendid fight put up by the Grand Officers of the P. W. A. before the Concilation Board we should think the men at Olive who listened to the smooth tongued orator from the States will feel rather ashamed of themselves. From what we have seen of the men of Cape Breton they do not need to go to the States for leaders, for they are quite capable of leading themselves. As a race the native miners of this Island are the equal of any miners anywhere. Their physique and their intelligence is above the ordinary, and their pawkiness and wise caution do not belie their Scots ancestry. We speak advisedly when we say that coal mining in Cape Breton is even *yet* only in its initial stages, and we think the Island can produce men with brawn enough to win the coal, and brains enough to see that they get paid for it.

The coal washery of the Dominion Coal Company, situated on the Sydney & Louisburg Railway near Port Morien, was completely destroyed by fire on the night of Sunday the 8th of March. The fire when first noticed by the watchman was only small, but owing to the dry and dusty nature of the surroundings it spread with great rapidity. The boiler house was speedily involved and the fires were drawn. This rendered the fire pump useless, and the firemen, who had speedily responded from Glace Bay, could not do much to check the flames. The loss is between $70,000 and $80,000, and is fully covered by insurance. The washer was an old one, of the Robinson-Ramsey type, and was used entierly for washing slack to supply the New England Gas & Coke Company, at Everett, Mass. The Gas Company will probably arrange to take dry coal unwashed for the present at any rate. The Coal Company will probably replace the Washery with a more modern plant, but the location is still undecided.

DOMINION COAL OUTPUTS FROM MARCH 1st to 14th, 1908.

ONTARIO.

Cobalt:—

Queen Alexandra.—This property, which is situated on the east shore of Cross Lake, has been sold to some Toledo, Ohio, people, represented by Mr. Mowery.

Silver Leaf.—The shaft is down 100 feet. The vein is from 6 to 13 inches in width in the bottom. It is very high grade ore. About 16 sacks of ore are filled daily.

Kerr Lake Crown Reserve.—The showing here cintinues as rich as ever. It is the intention of the management to contiue the cut until two carloads of ore are ready for shipment, and then start sinking a shaft. Their No. 1 ore will run over ten thousand ounces to the ton.

North Cobalt Mine.—Work has been discontinued here for the present.

Silver Queen.—The annual meeting of the shareholders will be held on May 1st. It is likely that a payment of annual dividend will be announced.

McKinley-Darragh.—Three cars of low grade ore have been shippeds so far, this month. This ore, which will run about 200 ounces, goes to the Pennsylvania Smelting Company.

O'Brien Mine.—There are 120 men at work here. No. 1 shaft is down 325 feet; No. 2, 90 feet and No. 6, 150 feet.

Provincial.—This mine has joined the list of shippers and sent out fifty thousand pounds of ore t oDeloro, last week.

Lorraine Township:—

Silver King Mine.—The annual meeting of the Silver King Mining Company was held in Haileybury on the 17th inst. Twelve men are at work on the property owned by this company.

The Haileybury Silver Mining Company.—The shaft on the property owned by this company is down 40 feet. A boiler, hoist and pump are being installed. 15 tons of ore have been sacked.

Mr. Pete Farrar, of New Liskeard, has bought two diamond drill outfits an dis sending one in to the Larder Lake district and one to Abitibi.

Hydraulic Compressed Air Company.—25 men are at work here. Two shafts are being sunk, one 11 feet in diameter and one 21 feet in diameter. The former is now down 60 feet and the latter 20 feet. They are to be sunk 430 and 340 feet, respectively. A 13-drill Sullivan air compressor, driven by water power, supplies air for the machine drills.

Montreal River.—Mr. Chas. Gifford has purchased a steam plant, consisting of boiler, hoist and pump and has sent them up to his property on the Montreal River. His property is looking very well. This is the first steam plant to go into this district.

The shipments from Cobalt, for the week ending March 14th, were the heaviest in the camp's history, amounting to 870,720 pounds.

The following were the shippers:—

	Pounds.
O'Brien, to Deloro	125,280
La Rose, to Denver, Col.	197,400
Mckinley-Darragh, to Carnegia, Pa.	189,660
Cobalt Central, to Copper Cliff	49,700
Nipissing, to Copper Cliff	63,000
Watts, to New York	52,730
Buffalo, to Denver, Col.	42,740
Right of Way, to Deloro	60,210
Provincial, to Deloro	50,000
J. Rowland, to Toronto (experimental)	40,000

A Cobalt correspondent has very kindly sent us the following account of a drill trial in that camp. It is worth careful persual.

"I yesterday witnessed an interesting test of a new Sullivan Air Hammer Drill, of which I though you would like a note:—

Drilling Test at Right of Way Mine, Cobalt, Ont.

17th of March.

"Drill used, Sullivan D.21, Air Hammer type.

"The hole was a dry back hole, in a drift, at a slope of about 75, and wes in hard conglomerate rock all the way. Drill was set up on a tie in the track.

"Time taken to set up after connections were made, was 20 seconds. The time consumed from the starting of drilling till the test was completed, was 18 minutes.

"The length of hole drilled, was 5 feet 4 1-2 inches.

"Five pieces of dril lsteel were used and the time for each was as follows:—

	Minutes.	Minutes.
1st drill	0—4	4
2nd drill	4—7	3
3rd drill	7—11	4
4th drill	11—15	4
5th drill	15—18	3
		18

"Time consumed in changing drills is included in above and was from 15—20 seconds for each change.

"The cuttings feel from the hole in a steady stream and the air in the vicinity of the drill was not nearly so dusty as would have been the case with an ordinary percussion drill."

GENERAL MINING NEWS

NOVA SCOTIA.

Sydney Mines.—The Nova Scotia Steel & Coal Company has notified its employees that, unless the steel market improves, a reduction of 10 per cent. in the wages of all employees receiving more than $1.50 per day will go into effect on May 1st.

Port Hood.—That the Port Hood explosion was due to gross neglect on the part of persons unspecified is the finding of the committee, Messrs. Moffatt, Moss and Scully, appointed by the Local Government to investigate into the disaster. The committee's report reads as follows:—

Hon. Christopher Chisholm,

Commissioner of Public Works and Mines,

Halifax, N.S.

Dear Sir,—

Having received authority through Attorney-General W. T. Pipes, we went to Port Hood on Monday, February 10th, or three days after the explosion. In company with Deputy Inspector Nicholson and Manager McLennan, we entered the mine on the following morning, going down the main slope to No. 3 landing. After travelling to No. 3 level north to the face, we returned and went into No. 4 slant, passing No. 3 balance on No. 3 level south. The mine is well aired and well timbered, the levels being clean and in good condition.

On our way into No. 3 level, we noticed a thin skin of ice at the landing where the ventilation was in full play. The face of No. 3 elvel is said to be 1,800 feet from the main slope. On passing through the level door we were met by unmistakable evidence of a gas or coal dust explosion. A heavy smell filled the level from the door to the face, and for those of us who has experience in mine explosions there was no doubt as to what had taken place, although there was nothing in the appearance of that part of the level to indicate an explosion.

Nearing No. 3 slant, however, we noticed debris scattered over the roadway, and were informed by the manager that for some distance outside of No. 3 slant the road had been cleaned up to permit of the easy running of a tram, which conveyed the dead bodies to the bottom, and to take back material to restore the ventilation. Between No. 3 slant and No. 3 balance we passed over two small falls of roof rock, and noted that nearly all the timber and material which had been lying alongside the level had been moved out of position and tossed about in all shapes, most of it close to the low side of the rib.

All the stopings but one between No. 4 slant and No. 3 slant had been blown out downwards, but were replaced by brattice. On reaching No. 3 balance we went up to the face a distance of 150 feet and made a close examination of everything there. At the foot of the back balance numbers of hand picks were strewn around, and farther up parts of stemming gear were seen lying in the middle of the place. Passing through the upper crosscut, we went down it. There were no signs of disturbances in these places, except on the bottom at the level; even the sight strings were not burnt. Going in towards No. 4 slant, we passed the place where the five men on the high level were found dead.

The position of the bodies as they were found was explained to us by the manager. Inside of No. 3 balance stood an empty box on the track, while tools, timber and other material were strewn promescuously around. No. 4 slant is 28 feet from the face of the upper and 46 feet from the face of the lower level. The bottom of the slant was filled up within three feet of the roof with coal and other materials, tools, such as shovels and picks, being partly buried. Some of the picks were fastened by the rope with which the miner generally carries his piece and powder cans, showing that these men were only going in to work, and were just on the way there when the explosion occurred, as five of the bodies were picked up at this spot. Inside of the slant towards the face of the level two booms were down, having been blown down by the force of the explosion. The bottom of the lower level at the foot of the slant was considerably torn and disturbed. Leaving the south side, we again entered No. 3 north level, and travelled the inside balance, making an examination of the bords. These were found in very good condition, the roof well timbered, free ventilation, and no gas.

Not being satisfied with the thoroughness of the investigation of the first day, we requested the manager to go into the mine with us on the following morning, which he did. We went into No. 3 balance, south carefully noting things as we proceeded. Nearing the back head, boots were found which had been blown out towards the slope a distance of forty feet. A full can of powder was found on the high side, the can seeming to be in fair condition, and but little injured by the explosion. A miner's jumper and a vest with a watch in the pocket was also picked up. The watch had stopped at 8.45. To ascertain whether it had been stopped by the sudden concussion of the explosion, we wound it up, giving twenty half turns of the stem. From this we gathered but little information as to the exact time the explosion had occurred, for it was evident the watch had run down. It was undamaged, as it started to go as soon as wound up. We again examined No. 3 back head and balance, went into the faces of the

upper and lower level, turned and travelled out the lower level to No. 3 slant. This level was in much better condition than the upper level, being free from falls of rock, although debris was scattered along it out to the slant. So far as we could gather from the condition of the mine, the explosion was not a violent one.

The nature of the explosion is undoubtedly one of gas. It occurred in the back head and balance, from which it scattered in all directions, the most of its force having been exerted along the upper level for a distance of 400 feet, and in No. 4 slant extending out the lower level a distance of 400 feet. The reasons for our conclusions are:—

1st.—That the heavy smell in that section of the mine is that usually caused by an explosion of gas or gas and coal dust combined.

2nd.—That the dust of the mine is too heavy to be suspended in the air (and if there were sufficient quantity of it as there is not) by the concussion of a blown out or a heavy shock. Evidence is wanting that a shot was fired at all.

3rd.—That no coking substance was found on the props or roadways as is usually found after coal dust explosions.

4th.—That there was no other element present to cause such an explosion as occurred there.

5th.—There is evidence showing that gas in quantity had been found in the balance.

That it occurred in the back head and balance seems more plausible and reasonable than to say it occurred in the lower level, because if any door was left open by which the air could take a short circuit it was No. 3 slant door. If this door had been left open naturally the air was cut off from the levels. There was gas in the balance and in the back head. If all four places, the upper and lower levels, the balance and back head, were full of gas set off in the lower levels it would certainly have reached the other three places, causing a tremendous explosion.

But as the effect of the explosion does not point to great violence, this theory must be discarded. It is more reasonable, however, to suppose that gas could have gathered in the balance and back head, owing to the knocking down of the brattice on the level between these places, and that this gas was the cause of explosion, the quantity being much less than from the four places combined, and there is evidence to show that the brattice between the balance and back balance was down.

As to how the explosion occurred, whether set off by a naked light, fired by powder from a can or shot, no one will ever be able to tell, as all in that section of the mine were killed.

In presenting this report we thank the Department for extending the authority which enabled us to fully investigate the cause of the explosion, and obtain information which may lead to prevention of similar disasters in the future.

John Moffatt,
Jos. Moss,
Thos. Scully.

Annapolis.—Messrs. J. J. Drummond, Selkirk, and Strong visited Annapolis recently for the purpose of selecting a site for an ore shipping pier for handling the Nictaux and Torbrook iron ore.

NEW BRUNSWICK.

If present indications are correct, the Northwest Miramichi will be the scene of an iron mining industry giving employment to a large number of men.

Messrs. James Robinson, Millerton; John Ferguson and W. E. Fish, Newcastle, and F. M. Tweedie and R. A. Lawlor, Chatham, are seeking incorporation as the New Brunswick Iron Mines Company, Limited, with a capital of $49,500. The chief place of business will be at Newcastle, but the company are seeking power to engage in mining, etc., in all parts of the province. It is generally understood, however, that the company has been organized with a view to the development of the rich iron ore deposits on the Northwest Miramichi, which are said to be equally as valuable as the Gloucester mine now being developed.

Mr. Ferguson, of Newcastle, has for several years been trying to bring the valuable property to the attention of capitalists, and the opening of the Gloucester mine, which adjoins the property held by the new company, has at length directed the attention of interested parties to the north shore.

It is stated also that the development of the property referred to will be carried forward on a large scale.

T. M. Burns, ex-M.P.P. of Bathurst, who was in St. John recently, stated that the work of the Gloucester iron deposits was still in progress. A surveying party of the Londonderry Iron Company were on the ground making surveys, he added, and the Intercolonial engineers who had been looking over the ground preparatory to building spur lines from the main line to tap the iron fields have completed their work. It is the intention of the promotors to begin mining as soon as possible in the spring, and there is no indication that they will change their intention.

There has been a good demand for the stock of the St. John Iron Company since the Dominion Iron & Steel Company entered upon the development of the Lepreaux iron deposits, but those who can afford to hold on to their stock refuse to sell.

The operations at present are limited to borings with the object of making a thorough testing of the deposit. It is hoped that by the early part of June that there will be about a hundred men at work. The Dominion Iron & Steel Company are confident as to the value of the property and will, it is expected, expend a great deal of money on its development during the approaching summer.

The plaster quarries of the Albert Manufacturing Company of Hillsboro' have closed down for a couple of months, owing to the dullness of the American markets, incident to election year. About 300 men will be temporarily out of employment. The management hope to resume operations in May.

ALBERTA.

Lethbridge.

It has been rumored for some time past that F. H. Sherman, president of District 18 U. M. W. of A., will run for the Provincial Parliament in the Pincher Creek district at the next election.

The report has, however, been officially denied by Mr. Sherman in the Fernie *District Ledger*.

The *Ledger* states there is no Labor party in Alberta, as the labor unions have declared for Socialism, and that at present active measures are being taken to organize the Socialistic party in many of the industrial centres.

Frank.

The following resolution was passed by the Frank local union No. 1263 of the United Mine Workers of America:—

"That, whereas three hundred miners and mine laborers have been idle since December 31, 1907, owing to the closing down of the Canadian American Coal & Coke Company's mines at Frank, Alta., thus cutting off the only means of support for ourselves, our wives and families, and whereas we have utterly failed to

obtain employment and are in consequence forced to depend on charity, owing to our wages being insufficient for us to save money to keep our families in times of depression;

"Therefore be it resolved that we make an appeal to the Provincial Government of the province to open up some public work for the purpose of providing us with an opportunity of earning an honest living for ourselves and families, and be it further resolved that copies of this resolution be sent to the Prime Minister of the province, to Mr. J. Marcellus, our local member, and to the press.

"(Signed) Geo. Nichol, Secretary."

Blairmore.

The third meeting of the joint committee of the Western Coal Operators' Association was held at Blairmore on March 10 and 11. The following gentlemen represented the Western Coal Operators: Mr. Hurd, general manager of the Crow's Nest Pass Coal Company; Mr. Stockett, general manager of Bankhead Mines, Limited; Mr. H. W. McNeil superintendent McNeill Company, Canmore. Representing District 18, U. M. W. of A.: A. J. MacDonald, Blairmore, Alta; W. Graham, Coleman, Alta.; W. Davis, Michel, B.C.

The following decisions were arrived at: In the matter of the claim that the lampmen at Michel be paid $2.62½ per day, and in the matter of the lampmen at Coal Creek.

The joint committee of the Western Coal Operators' Association and District 18 of the United Mine Workers of America have decided that Michel lampmen be paid $2.62½ per day, and the Coal Creek lampmen be left to the management of the company to deal with.

Lewis Stockett, President.
A. J. McDonald, Secretary.

In the matter of the International Coal & Coke Company, in respect to proposed new work at the Coleman mine, the joint committee of the Western Coal Operators' Association and District 18 of the United Mine Workers of America is of the opinion that the agreement under which we are working specifically provides that new work must be in actual operation before any contract price is established for the same and until such price is established all men shall be paid the day wage scale, and that therefore the International Coal & Coke Company be advised to establish the new work before bringing the question of new prices for the same before this committee.

Lewis Stockett, President.
J. A. McDonald, Secretary.

Strathcona.

Although work has been going on smoothly in the Strathcona mine since a dispute was settled some time ago under the Lemieux Act, friction has again arisen.

Owing to the low price of coal the company met the men and asked for a reduction in the mining price. The men would not grant this reduction, so the Strathcona Coal Company shut the mine down, paid off the men and did not open again till they got a small force of non-union men to start work on the reduced rate. The miners claim the Company has broken the agreement entered into some time ago, and have been distributing hand bills setting out their grievances. The bills circulated by the miners read as follows:—

NOTICE TO MINERS, MINE LABORERS AND OTHERS.

We request you to keep away from the Strathcona mine for the following reasons:—

In December last the United Mine Workers of America signed an agreement with the Strathcona Coal Company before the investigation board appointed by the Dominion Government, which agreement went into force on the 23rd December, 1907.

The company now refuses to abide by its contract and insists upon a reduction in wages from 33 1-2 cents to 28 cents, and threatens further to reduce wages to 25 cents per car for mining coal.

Furthermore, they refuse to pay the District scale for any work whatsoever and have failed to pay us our wages at all for near two months.

We now refuse to work until the company keeps its agreement with us. Kindly keep away from the Strathcona Coal Company's mine pending the settlement of this dispute.

By order of District 18 United Mine Workers of America.

Edmonton.

Several important amendments were made to the coal mines regulations during the recent session of the Provincial Parliament.

One of these amendments was to the effect that no boy under 16 years of age shall be employed in any mine underground, but making exception for boys already employed underground although not 16 years of age. No boy under 12 years of age shall be employed at any mine above ground, and boys under 16 years who are employed above ground must be able to read and write and have a knowledge of elementary arithmetic.

The section of the Act relating to the distance between shafts or outlets has been amended so that such shafts or outlets must not at any point be nearer to each other than 100 feet. This amendment is in accordance with the recommendation of the recent Royal Commission on the coal mining industry in the province.

The section relating to the qualifications required for mine managers has been amended so that a candidate for a mine manager's certificate must have at least five years' practical experience in a mine and be at least twenty-three years of age. Candidates possessing a degree or diploma in scientific or mining training only requires three years' practical experience, however. Candidates for pit boss and fire boss certificates must have three years' practical experience in a mine and be twenty-three years of age.

The section relating to the appointment of check-weighers is amended by making it compulsory for the owners of the mine to withhold from the wages of the miners employing this check-weigher a pro rata amount sufficient to meet the wages due the check-weigher.

Owners of coal mines are required to make certain returns to the Minister of Public Works before the 21st day of January in each year. Such returns are required to show the amount of coal mined during the previous year and the number of men employed at the mines.

The Act is amended so that after each visit to a mine the Inspector of Mines must post a synopsis of his report in some conspicuous place near the mine.

In mines in which gas has been found within the previous 12 months then a fire boss appointed for the purpose must examine the mine with a safety lamp immediately before the commencement of work in each shift, and must make a written report on the condition of the mine before men are allowed to enter.

It is also made illegal where safety lamps are used for anyone to unlock a safety lamp or to have matches or any smoking material whatsoever in his possession in the mine, and where safety lamps are used in a mine open lights may not be used between the place where the safety lamps are used and the main return airways.

With regard to blasting in a mine, the owner of the mine must provide some non-inflammable material such as clay for the men

to stem their shot holes with. It is illegal to use in any one shot any two classes of grades or qualities of explosives.

In mines in which safety lamps are required to be used no person but a shot-lighter holding a certificate under the Act may fire shots. It is the duty of this shot-lighter before firing any shot to examine the shot hole and see that the right quantity and quality of explosive is used, and also to see that there is no gas present.

If inflammable gas has been found in a mine the shot shall not be fired till the gas is removed or unless the explosive employed in firing the shot is so used with water or other contrivance as to prevent it inflaming gas or is of such a nature that it cannot inflame gas.

If the place where the shot is to be fired is dry and dusty then the shot shall not be fired unless the place of firing and all contiguous accessible places within a radius of twenty yards are in a wet state from watering or unless some safety explosive is used.

Explosives are not to be thawed underground, but the owner of every mine must provide a suitable thawing apparatus on the surface at each mine.

An important amendment is to the effect that a suitable supply of timber shall be constantly kept in each working place as near the face as practicable and in no case further away than the nearest cross-cut to the working face or other convenient place in the vicinity thereof.

The owner of a mine when more than 20 men are employed is required to furnish a washroom for the men.

When a committee of the men employed in the mine make an examination of such mine as they are allowed to do by law, then, so one of the amendments reads, should such committee report the existence, or apprehended existence of any danger, it is the duty of the owner of the mine to send a copy of the committee's report to the inspector of the district.

The books, such as fire boss report books, etc., required to be kept at a mine, must be furnished by the mine owner and by an amendment any person employed in the mine can examine these report books, or anyone having the written authority of anyone employed in the mine can examine the said report books.

The above are the chief amendments to the Coal Mines Act, and ought to prove beneficial to the welfare of employer and employee alike.

The amendments dealing with blasting in gaseous or in dusty mines are certainly of great importance, and if rigidly enforced will go a long way to prevent explosions.

SASKATCHEWAN.

Taylorton.

The dispute which has been going on for some time past between the employees of the Manitoba & Saskatchewan Coal Company at Bienfait and the company reached a climax when the employees, 50 in number, asked the Labor Department at Ottawa for a board of investigation to be convened to enquire into the hours of work and rate of wages. The employees, who are members of the United Mine Workers of America, have nominated F. H. Sherman as their representative on the board. The date of the investigation is not yet fixed.

Saskatoon.

The work at Eagle Lake which has been undertaken by the Government of the Province, to prove the coal deposits in that district, has only been a partial success. While coal was undoubtedly found, yet the seam was thin and was split in two by a clay band. Considerable difficulty was also experienced in mining the coal, as the roof was a soft clay which made timbering very difficult. On the whole the property did not come up to expectations, but work is still going ahead and better conditions may yet be found.

ONTARIO.

Cobalt.—The Little Nipissing will soon become a shipper.

In the past five months, under the management of Superintendent Houston, the Right of Way has done 800 feet of crosscutting and drifting and 150 feet of sinking. Four drills are working.

On the Drummond mine thirty-six men are working. Three drills are on double shift. At the Jacobs ninety-two are employed and between nine and ten drills are kept in commission. The old No. 3 shaft is down 300 feet.

Deseronto.—The furnace of the Deseronto Iron Company is temporarily closed on account of transportation difficulties.

BRITISH COLUMBIA.

Vancouver.—On the Fraser river, near Lillooet, a dredging concession of three and one-half miles has been acquired by American interests. A dredge, to cost about $75,000, will be built this summer.

Trail.—The shipment to Hong Kong during the second week of March of 140,000 ounces of silver from the Consolidated Mining & Smelting Company's plant at Trail brings the shipments of silver from this plant for the past six months to over one million ounces. Nearly half of this has gone to the Canadian mint at Ottawa. All gold from this plant is now shipped to the assay office at Seattle and from there to the various branch mints of the United States. So soon as the Canadian mint is ready for gold, the Trail smelter and refinery is able to supply it, so that the output of the Canadian mint will be almost entirely from the Trail plant. Between fifty and sixty tons of lead are produced daily, most of which is shipped to the Orient. The company is ready to blow in the largest copper furnace in Canada, and a new crusher has been added, which crushes and samples the full tonnage in one instead of three eight-hour shifts. It is estimated that the sales of copper throughout the United States were sixty million pounds during the past three weeks, and that approximately every pound of copper above ground has been sold. The present price of copper represents only about the average cost of production. Lake coppe ris quoted at 12 1-4 cents and 12 5-8 cents, and electrolytic at 12 1-4 cents and 12 3-8 cents. Lake copper is copper which does not require refining, and is supposed, also, to be of superior quality. Electrolytic copper, as is known, is the general copper refined by electrolytic methods. It will be interesting to note the cost of producing copper in various localities. At Lake Superior it costs 9 1-2 cents a pound; at Butte, 10 1-2 cents; at Bisbee, Ariz., the cost is only 8 1-2 cents; while at Globe, Clifton and Morenci, Ariz., it costs 12 cents. At Cananea, Mexico, 13 cents is the cost of production.

Nelson.—Work has been resumed in the Queen Victoria mine. J. P. Swedeberg is in charge. Mr. Swedeberg owns the property.

Victoria.—Mr. H. C. Brewster (Alberni) has introduced a bill into the Provincial Legislature which is designed to protect miners employed on properties operated by other than the owner. Speculators often bond mining properties from owners and commence operations for the limited period specified in the bond. As the miners have always two weeks' pay coming to them, the operator, if unsuccessful in floating a company, often disappears and leaves the men unpaid. In these cases there is no one to be held responsible. Mr. Brewster's bill aims at removing this abuse. It proposes to force the operator to deposit in a bank a sum sufficient to meet the wage requirements. Failure on the part of the operator to comply with this should be sufficient warn-

ing to the workmen. The provision reads as follows: "Whenever any operator shall employ any miner in or about a mine, such operator shall, within ten days from the time he first begins to operate or work such mine cause to be posted up in a conspicuous place at such mine, where it may be seen and read by the miners, a certificate signed by the manager of a branch within British Columbia of some chartered Canadian bank, certifying that such bank holds or becomes responsible for a specified sum of money, to be used so far as necessary to pay the wages of miners employed at the mine by the operator; such certificate may be replaced or supplemented from time to time by another. Each certificate shall be posted up as aforesaid at the mine within fifteen days of its date, and the specified sum therein mentioned shall not be less than will at any time thereafter pay all the wages then owing miners for work at the mine, and that may be earned by the miners then working there until the next regular monthly or other pay day, and for and during another month after such pay day." The liability of the bank, the operator, and the workmen, is fully defined and the form of the bank certificate is provided. It is further provided that any miner may in writing relinquish his rights under this Act. He may also after fifteen days' notice in writing resume those rights. It is made unlawful for an operator to incur a greater liability in wages to the miners than the sum mentioned in the bank's certificate.

Rossland.—The mines of the south belt of Rossland are enjoying a modest boom. Sunset No. 2 and Homestake are to be worked under lease.

A. B. Perry and G. G. Wilson have leased the O. K. mine and mill. Mining will be begun at once. The mine is on the south slope of the O. K. Mountain, two and a half miles west of Rossland and a quarter of a mile from the Red Mountain railway loop. The mill is a ten-stamp one.

Cranbrook.—The Sullivan smelter at Marysville and the Kimberly mines have closed down indefinitely. Operating difficulties and not financial strengency caused the cessation of work.

Rossland.

The Rossland mines are shipping from 5,600 to 5,800 tons of ore per week and up to the 17th of March had shipped 61,571 tons for the year. The shaft at the Centre Star will be deepened a couple of hundred feet in the near future. This would give them a depth on the dip of the ledge of 2,400 feet. The workings of the big mines here should soon pierce and cross the permanent water line, and it is hoped that when this is done the long looked for zone of second enrichment will be discovered. The lessees of the Blue Bird have installed a small drilling plant, and the mine is looking better every day. The Canadian Goldfields Syndicate has leased the Sunset to some local miners. The O. K. mine, a pockety, free gold property, to the west of the camp, has also been leased. Mr. W. A. Carlyle has finished his examination of the Le Roi mine and is now en route to London, where he will make his report. The smelter at trail has just completed the installation of the largest copper furnace in the Dominion. It has a capacity of 500 tons per day of ore and flux. The Trail refinery has shipped another 140,000 ounces of fine silver to Hong Kong. It is suggested here that arrangements may be made to treat some of the Cobalt low grade ore at British Columbia smelters. Some of our mining men seem to think the idea feasible, if proper freight rates could be obtained, as the ore would no doubt be valuable as a flux.

Boundary.

While the Granby is occupying a lone position on the Boundary shipping list, still, it is giving a good account of itself and is making new records weekly and then surpassing even the new ones. During the last week they shipped nearly 25,000 tons of ore to the Grand Forks smelter, taxing the capacity of that plant to its limit. The Phoenix mines shipped 80,155 tons of ore to the smelter during February, which was 6,000 tons more than they handled in January. One good feature of the situation is a plentiful supply of coke, cars, labor, etc. It takes four giant machines to crush the 33,000 tons of ore that is sent out daily, one of which, with a receiving capacity of 42 inches by 30 inches, is capable of crushing 150 tons per hour, if need be. On Friday, the 13th, the company exceeded all previous daily records and forwarded 4,005 tons down the hill. Up to the 14th of March the total for the year was 194,187 tons shipped by Granby.

While the Granby smelter is the third largest in the world, it is to be further enlarged, and by next fall will have a capacity of 4,500 tons per day. The blast furnaces, convertor plant, convertor building and blowing engine plant will be augmented and the additions will cost about $2,000 before they are all made. The machinery is now on order and is to be delivered before July 1st. In part it will consist of two Connersville blowers of 30,000 feet capacity each, four 150 Canadian Westinghouse motors to drive them, and a 500 Nordberg blowing engine, of a capacity of 10,000 cubic feet free air per minute to 15 pounds pressure.

Some additions will be made to the smelting plant of the Dominion Copper Company before work is resumed. The new machinery which has just arrived at the British Columbia Copper Company's Mother Lode mine is being installed and will be all ready to start up when the time comes to go back to work. A Spokane enterprise will expend $10,000 on a dredge to work on Granite Creek. They claim they can work the ground to bedrock and make it pay. These grounds were worked profitably in the early days of 1886-7. The Sally mine at West Fork has shipped another car of ore to Trail smelter. Comments have been made on the selling in New York of Dominion Copper 6 per cent. bonds at $45. At this price the returns are 13 per cent. The company has several hundred thousand dollars in the treasury. The New York office of the Granby Company have decided to pass the quarterly dividend, and as a consequence the shareholders here are not likely to receive any more cheques until copper climbs a little. Only 768,000 pounds of copper were shipped into the States this year in January, whereas 2,410,116 were sent over the line in the same month during 1907.

Slocan—E. Kootenay.

Nothing new has developed in the closing down of the Sullivan mine and smelter in consequence of the recalcitrant zinc in the ore and other troubles. The minority shareholders are holding a meeting in Spokane March 19th for the purpose of discussing the best means of protecting their interests should the mortgagees take action. A strike of good ore is reported from the Flint mine. The ore in the Granite, near Nelson, is improving with depth. Diamond drilling is in progress at the St. Eugene mine, Moyie. Their pay roll for February amounted to $35,000.

Crow's Nest.

The International, Alberta, Galbraith, Royal and Crow's Nest Pass coal mines continue to operate steadily. The Crow's Nest Pass Coal Company mined 9.81931 tons of coal in 1907, as against 213,295 tons in 1906, showing a material increase in production. The pay roll at their mines averages $185,236 per month.

Coast, Etc.

The Monarch mine at Field continues to work. While this company is working under difficulties, still they state the proposition is paying its way. While no great rush is expected into the Findlay river country, good reports are received by men coming out of there, and they state that it is a rich section. It is generally conceded that it is a little early yet, though, to go into that district. The best route is via Hazelton, and that is the trail most used at the present time. Boston capitalists are going to expend a large sum for a gold dredging plant to be used on the Fraser river near Lillooet this season. The sand and gravel

in that particular vicinity is difficult to treat and several companies have failed in their attempts, but this concern is satisfied that they can solve the problem with an up-to-date machine.

General conditions throughout British Columbia are looking very sunny when everything is taken into consideration. While several of the big mines, both metal and coal, are closed down, a slight advance in the price of copper will mean the resumption of work and no doubt early summer will see the situation considerably changed unless other troubles crop up. Considerable money will be spent for railway work in this country, including the big contract for the Western end of the Grand Trunk Pacific, which should help to a great extent.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

Twenty-six miners lost their lives by the breaking out of fire in the Hemstead colliery, near Birmingham, on March 4th. Great efforts were made to rescue them, the work being continued for several days. The rescue apparatus, which was put to a practical test for the first time, proved ineffective, and one of the rescue party was sucocated by the fumes.

The Glamorgan colliery has been purchased by the Cambrian Colliery Company for £240,000. This is believed to be a preliminary step in the direction of a large combination of enterprises in connection with the coal export trade.

RUSSIA.

The quantity of copper smelted in the Ural district in 1907 was much in excess of the output of any preceding year. It amounted to 434,918 poods of metallic copper as against 260,788 poods in 1906.

Attention is being directed to the Altai asbestos deposits, which have been found to be of fine quality. The principal source of supply at present is in the Urals, but it is claimed that owing to more favorable topographical conditions the first cost of the product in the Altai district will be 50 per cent. less than at the Ural mines.

GERMANY.

A German zinc syndicate was organized at a recent meeting of owners of zinc works, which aims at the regulation of production, sales and prices for the next three years. It includes all the German producers with one exception.

Official statistics give the total production of coal in 1907 at 143,222,886 tons.

FRANCE.

The total production in mineral combustibles for 1907 was 36,930,250 tons, of which 764,861 tons was lignite. The increase over 1906 was 2,733,865 tons.

AUSTRALASIA.

The coal industry of Queensland, Australia, has received a stimulus owing to the operators having obtained a contract for 60,000 tons for the United States navy at Manila.

Explorations by the State Mines Department in the Powlett River district, Victoria, have resulted in the discovery of a seam of good coal four feet thick at a depth of 495 feet. Two other seams each one foot nine inches thick were pierced at lower levels. It is believed that the Powlett River district is much more extensiv than has hitherto been supposed.

Owing to the high price of tin there is great activity in tin dredging in the Emmaville district, New South Wales. Four dredging plants are in successful operation, and one company is preparing to spend £100,000 in development.

In Ballarat, Victoria, a company has been organized headed by the Mayor, and has taken up 200 acres of land in the heart of the city to prospect some of the quartz lodes.

SOUTH AFRICA.

Owing to the slump in the demand for diamonds, it has been decided to close down the Du Toits Pan diamond mine, Cape Colony, which is part of the De Beers property, on April 24th, until the market improves.

The outlook for the mining industry in Rhodesia is promising except for the scarcity of native labor. The gold output of Southern Rhodesia for January was 50,521 ounces. There are 175 gold producing mines, of which 129 produced fine gold during the month. The total January output of minerals was valued at £201,508.

The proposed new gold law of the Transvaal places considerable limitations on prospecting and the holding of claims which are not worked. The mining community are strongly opposed to some of its provisions.

UNITED STATES.

The commission appointed in Oklahoma to consider the question of the purchase by the State of 440,000 acres of coal and asphalt lands, has recommended their acquisition at a price not exceeding $10,000,000—to be raised by an issue of State bonds.

The Washoe smelter of the Amalgamated Copper Company at Anaconda, Montana, is again in operation, and it is anticipated that it will very shortly be turning out copper at its normal capacity of over 15,000,000 pounds per month. When fully in operation it will resume the purchase of custom ore, which will mean the resumption of work in several important companies in the Butte district.

In the Juneaw mining dsitrict, Alaska, there has been a steady advance in gold mining development. At the Treadwell group on Douglas Island the use of oil instead of coal has been introduced for the steam plant, materially reducing the cost of power.

HAITI.

Valuable gold placer districts have been discovered, one of the most important of which is situated in the southern portion of the island near Jacmel. Concessions have been secured from the Government by parties who are undertaking to develop the properties.

MEXICO.

Stockholders of the Douglas Copper Company have secured control of the Ryall and Mix concessions, Sonora, covering about 1,500,000 acres, which will be developed by the Mexican Exploration & Mining Company, capitalized at $5,000,000.

Three new smelters have recently been put into commission in Chihuahua, and are operating satisfactorily. Two of these plants are entirely new and the third has new machinery and improvements.

PERU.

Great preparations are being made by the Cerro de Pasco Copper Company, recently incorporated with a capitalization of $60,000,000, to develope the copper mining industry. The promoters of the enterprise are Mr. J. B. Haggin and other New York financiers, who have for some time been extensively engaged in this field. The export of refined copper from Peru twelve years ago was only 1,007,228 pounds, but since the Americans began work at Cerro de Pasco it was greatly increased, the shipments to the United States last year being 20,152,000 pounds.

STATISTICS AND RETURNS.

NOVA SCOTIA'S MINERAL OUTPUT.

Fiscal Year Ended Sept. 30th, 1907.

Nova Scotia's coal output in the fiscal year, 1907, was 125,945 tons less than in 1906, the amounts raised in each year being 5,866,605 and 5,730,660 tons respectively, according to the figures contained in the report of the Mines Department laid on the table of the House recently. Only in two counties, Inverness and Pictou, was more coal raised in 1907 than in the previous year. Inverness' figures were 345,391 tons, compared with 234,906, a gain of 110,941 tons. Pictou county produced 731,921 tons, 61,485 tons more than in 1906. In Cape Breton the output was 175,191 tons behind 1906, owing to the fire in the Hug colliery, while Cumberland county, owing to the strike in Springhill, went 130,526 tons behind the 1906 figures, only producing 508,202 tons.

Returns of Coal Sold.

The returns of coal sold during the year 1907 show, compared with the returns of 1906, as follows:—

	1906.	1907.
Nova Scotia	1,962,206	1,842,419
New Brunswick	434,882	427,128
Newfoundland	149,506	146,502
Prince Edward Island	76,809	77,493
Quebec	1,739,308	1,709,493
West Indies	.....	2,598
United States	769,775	616,312
Mexico	.....	7,591
Other countries	62,104	12,483
Bunker	.....	204,572
Total	5,194,590	5,046,690

The mineral output of the province for the year ended September 30th, 1907, was:—

Coal raised, gross tons	5,730,660
Pig iron, gross tons	293,436
Coke made, net tons	493,102
Iron ore, gross tons	562,746
Lime stone, net tons	458,601
Gypsum, gross tons	332,345
Gold, ounces	15,006
Bricks	25,000,000
Building stone, net tons	63,861
Cement, barrels	58,762
Antimony ore, net tons	1,403
Manganese ore, gross tons	495
Copper ore, net tons	2,471
Drain pipe, feet	300,000
Grindstones, net tons	350
Copper, pounds	12,320
Moulding sand, net tons	190
Barytes, net tons	.....

COBALT ORE STATEMENT.

For the Week Ending March 14th, 1908.

O'Brien Mine—March 7th, to Doloro Mining Company, Doloro, Ontario, 63,000; March 12th, 62,280 pounds. Total, 125,280 pounds.

La Rose Mines—March 7th, to La Rose Mines, Denver Col., 40,000 pounds; March 7th, 57,400 pounds; March 10th, 40,000 pounds; March 13th, 60,000 pounds. Total, 197,400 pounds.

McKinley-Darragh-Savage Mines—March 13th, to Pennsylvania Smelting Company, Carnegia, Pa., 62,460 pounds; March 13th, 64,200 pounds; March 13th, 63,000 pounds. Total, 189,660 pounds.

Cobalt Central Mining Company—March 7th, to Canadian Copper Company, Copper Cliff, Ont., 49,700 pounds.

Nipissing Mines Company—March 7th, to Nipissing Mines Company, New York, 63,000 pounds.

Watts Mine—March 11th, to American Smelting & Refining Company, Denver, Col., 52,730 pounds.

Buffalo Mines—March 11th, to Canadian Copper Company, Copper Cliff, Ont., 42,740 pounds.

Right of Way Mining Company—March 12th, to Doloro Mining & Reduction Company, Deloro, Ont., 60,210 pounds.

Provincial Mine—March 13th, to Deloro Mining & Reduction Company, Deloro, Ont., 50,000 pounds.

J. Rowland—March 14th, to Cowan, Toronto, Ont., 40,000 pounds.

Totals—870,720 pounds.

RAND OUTPUT SMALLER.

Official announcement is made that the production of gold at the Rand for January reached a total of 541,930 fine ounces, against 560,329 fine ounces in January, and 493,542 fine ounces in February a year ago. Last month's figures, based on the market value of $21.25 per ounce, represented $11,516,012, against $11,906,991 in January, and $10,497,767 in February, 1907.

The following tables gives the output by months (in fine ounces) for a series of years:—

	1908.	1907.	1906.	1905.
January	560,329	537,638	428,638	369,258
February	541,930	493,542	407,668	363,811
March		538,497	443,723	399,833
April		537,019	439,243	399,166
May		524,477	461,202	416,395
June		507,559	475,975	412,317
July		532,711	491,793	419,595
August		555,037	509,115	428,581
September		538,034	505,111	416,487
October		553,553	540,600	415,527
November		549,801	533,373	424,757
December		583,526	550,167	431,594
Total	1,102,259	6,551,662	5,786,617	4,897,221

BRITISH COLUMBIA ORE SHIPMENTS.

Week ending March 7th and year to date:—

	Week.	Year.
Boundary shipments—		
Granby	23,663	169,630
Crescent	28	28
Other mines		411
Total	23,691	170,069
Rossland shipments—		
Centre Star	3,042	32,420
Le Roie	1,634	15,300
Le Roie No. 2	854	6,351
Evening Star	79	334
Total	5,606	54,405
Slocan-Kootenay shipments—		
St. Eugene	593	5,070
Whitewater	90	156
Whitewater, milled	280	2,660
Queen, milled	185	1,655
Poorman, milled	250	1,600
North Star	76	656
Arlington, Erie	44	605
Vancouver	20	394
Ferguson	96	370
Richmond	51	365
Standard	21	337
Emerald	27	316
Ruth	41	241
Rambler-Cariboo	45	213
Nugget	22	191
Kootenay Belle, milled	25	125
Gallagher	25	25
Wellington	8	8
Grant	1	1
Other mines		8,967
Total	1,900	24,955

The total shipments for the past week were 31,197 and for the year to date 249,429 tons.

NOVA SCOTIA STEEL COMPANY'S COAL SHIPMENTS.

The coal shipments of Nova Scotia Steel & Coal Company for February and the two months are as follows:—

Shipments February, 1908	41,230
Shipments February, 1907	25,245
Increase February, 1908	15,985
Shipments 2 months, 1907	55,974
Shipments 2 months, 1908	88,980
Increase 2 months, 1908	33,006

During the month of February the Nipissing Mines produced approximately $102,000 worth of ore and shipped ore to the smelters that month of a value of $54,000.

The output of the Crow's Nest Pass Coal Company's collieries for this week was 21,140 tons; daily average 3,523 tons. The week in the past four years compares as follows:—1908, total, 21,140 tons, daily average 3,523 tons; 1907, total 20,105 tons, daily average 3,351 tons; 1906, total 18,523 tons, daily average 3,087 tons; 1905, total 11,997 tons, daily average 1,999 tons.

OUTPUT OF COAL AND OTHER MINERALS IN THE UNITED KINGDOM IN 1907.

COAL.

The Home Office Mining Department has issued its annual preliminary return, showing the quantities of coal and other minerals raised in the United Kingdom in 1907, together with statistics as to the persons employed. The output of coal from mines under the Coal Mines Regulation Act, which was 251,050,809 tons in 1906, was 267,828,276 in 1907, showing an increase of 16,777,467 tons. The increase in the twelve inspection districts respectively were as follows:—

	Tons.
East Scotland	1,660,482
West Scotland	439,697
Newcastle	764,906
Durham	1,154,128
York and Lincoln	2,624,036

Ironstone.

To the total output of 8,236,118 tons of ironstone, shown in the above table, the principal contributing districts were as follows:—Cleveland, 6,230,987 tons; Staffordshire, 1,036,239 tons; and Scotland, 700,148 tons. These figures do not include the quantities work on the West Coast, in Lincolnshire, Warwickshire, and one or two other districts, neither do they include the output from quarries.

Mineral Production Under Metalliferous Mines Regulation Acts.

The following table shows the output of various minerals under the Metalliferous Mines Regulation Acts, during 1907, as compared with 1906:—

Description of Mineral.	Total in 1907. Tons.	Total in 1906. Tons.
Arsenic	1,473	1,699
Arsenical pyrites	697	640
Barytes	30,343	27,827
Bauxite	7,537	6,654
Chalk	1,765	2,902
Chert and flint	5,372	4,912
Clay and shale	114,525	118,521
Copper ore and copper precipitate	6,759	7,758
Fluorspar	40,229	36,280
Gold ore	12,987	17,384
Gypsum	195,266	196,143
Igneous rocks	69,871	72,722
Iron ore	1,803,063	1,824,415
Iron pyrites	2,800	3,798
Lead ore	31,215	30,226
Limestone	470,263	765,718
Manganese ore	16,098	22,762
Ochre, umber, etc	4,789	4,415
Oil shale	210	409
Rock salt	243,345	230,558
Sand	23,580	12,642
Sandstone	b156,324	168,077
Silver ore	4	1
Slate	116,570	126,699
Tin ore (dressed)	6,087	6,276
Uranium ore	71	11
Wolfram	312	263
Zinc ore	19,945	22,824
Total	c3,381,491	3,712,436
Number of persons employed:—		
Underground	18,559	17,818
Above ground	13,008	12,413
Total	31,567	30,231

a Including 8,363 tons of calc spar.
b Including 11,864 tons of ganister.
c In addition to this quantity 80 tons of mixed ores (containing arsenic, copper, tin and wolfram) were obtained.

Minerals.

The output of various minerals under the Coal Mines Regulation Acts, and the number of persons employed in their production, are shown in the following table:—

Description of Mineral.	Total in 1907. Tons.	Total in 1906. Tons.
Barytes	10,297	7,199
Clay and shale, other than fireclay and oil shale	320,889	252,275
Coal	267,828,276	251,050,809
Fireclay	2,890,197	2,971,173
Igneous rocks	146	424
Iron pyrites	7,394	7,342
Ironstone	8,236,118	8,209,880
Limestone	22,366	32,816
Oil shale	2,675,779	2,546,113
Petroleum	.....	10
Sandstone (including Ganister)	*128,103	126,675
Total	282,119,565	265,204,716
Number of persons employed:—		
Underground	757,887	709,545
Above ground	182,731	172,800
	940,618	882,345

*The quantity of ganister obtained was 120,103 tons.

Company Reports.

Nipissing declared its regular quarterly dividend of 3 per cent., or 15 cents a share, payable on April 20th. Books close March 27th and re-open April 23rd. The financial statement of the company as of March 14t his approximately as follows: Cash and silver bullion on hand, $457,000; accounts receivable, $134,000; ore in transit and at smelter, $175,000; total $896,000, less dividend of 3 per cent., payable April 20th, $180,000; balance, $716,000. It is stated that financial condition of the company and conditions at the mines continue to show improvement. It is expected that by April 20th the company will have earned nearly the $180,000 required to pay the dividend declared.

It Needs No Paint!

Amatite ROOFING

TRADE B MARK

MOST ready roofings require a certain amount of repairs and painting every season or two in order to keep them free from leaks.

This expense is now unnecessary. With an Amatite roof it is cut out entirely.

Paint offers only temporary protection at best. Every few years it must be renewed. When you buy a roofing that requires painting you are really buying two articles—roofing and paint—to do the work *that Amatite can do alone.*

Amatite has a real mineral surface. This top surface will withstand the severest kind of weather for many years and insures an amount of protection to your buildings that no other ready roofing can offer. Beneath this mineral surface are double layers of Felt and Coal Tar Pitch—the same waterproofing that is used by the United States Government at West Point, at some of the Navy Yards, at the New York Custom House, and many other such buildings. It is the *greatest waterproofing material known* and you are sure of getting it only when you buy Amatite.

With Amatite once on your buildings you do not have to bother with painting and coating. This is necessary with all smooth surfaced roofings, but with Amatite *that expense and trouble are entirely done away with.*

Although it has so many points of superiority, its cost is no more than the usual run of roofings ; in fact, in many cases it is lower.

Is it any wonder that last year we were unable to supply the demand for Amatite ?

FREE SAMPLE

Let us send you a Free Sample and Booklet which tells the story in detail and shows photographs of buildings in many sections of the country which depend on Amatite for their protection against storms and weather

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

Branches at COBALT and LATCHFORD, in the silver mining camp of New Ontario.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $1 an acre according to the distance from railroad.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St., Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch, If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers, kindly mention this Journal.

Dominion of Canada

Synopsis of Canadian North-West Mining Regulations

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

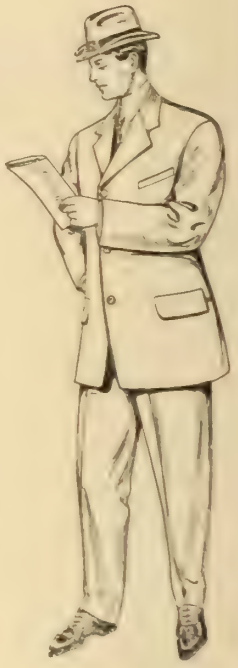
The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,



Deputy of the Minister of the Interior

Men's Tweed Suits

Regular $10.50 Value for $7.95

M.J.104. After carefully going through the different makers' samples, to which our large buying powers give us access, we selected this material on account of its worthiness in wearing qualities and its neat yet handsome pattern, which lends itself particularly well to this style of suit. By contracting for the entire output of this line, we have secured a price concession which enables us to offer our customers this big saving on an honest suit.

The material is an imported English tweed of durable quality, in a dark ground with lighter intermixture, giving a pepper and salt effect; into this is woven red and blue stripes and cross stripes, forming a subdued broken check pattern, being neat and quiet—a material which any gentleman would select for business or general wear, made in a single-breasted sack style, lined with a fancy twilled mohair lining, stayed with linen, shoulders and front reinforced with shrunk linen duck and hair cloth, guaranteed to retain their shape, well tailored and perfect fitting, sizes 35 to 44. Regular $10.50 value,

Our Special Price 7.95

A Sensational Tent Offer

$16.00 Value for $11.95

M.J.105. Experienced summer campers prefer this style of tent because it is so easily erected, and is practically storm-proof. By placing large orders with one of the largest manufacturers on the continent we are able to offer the BIGGEST TENT BARGAIN you have ever heard of. This tent is made of full weight 8-oz. duck. The seams are double stitched and strain points reinforced. Height, 8 ft.; length, 12 ft; width, 9 ft. 6 in.; height of wall, 3 ft. Complete with poles, pegs and ropes. You will find that the lowest price for this tent elsewhere is $16. Our special price **$11.95**

Money Refunded if for Any Reason you are Not Satisfied

are more widely used for testing mines and mineral lands than any other prospecting drills made, because they remove a solid core from all rock formations penetrated, from soft coal or rock salt to the hardest ores. Will bore holes at any angle and to any depth, and will remove cores of any desired diameter.

Drills are carried in stock in capacities from 300 to 6500 feet. They may be operated by hand, horse-power, steam, air, oil, gas or electricity. There are more than 25 sizes and styles to select from. *Send for 160-page Catalog, No. 655.*

MINING SOCIETY OF NOVA SCOTIA.

On another page full notice is given the annual meeting of this live and energetic body. The vigor and hospitality of the Mining Society have become proverbial. Its announced ambition is to develop and advertise the mineral resources of Nova Scotia. With this in view representatives of the Canadian and United States Geological Surveys and of sister societies were invited to attend the recent annual meeting. These distinguished visitors were asked for advice and they gave it.

The freedom of the Ontario Bureau of Mines from political influence was pointed out by one speaker. Another described the work of the United States Geological Survey, especially in its relation to State surveys. Substantial assistance was promised from the Mines Branch of the Federal Department of Mines. On behalf of the Geological Survey, a continuance of the invaluable work done by Messrs. Fletcher and Faribault was assured.

This should be eminently encouraging to Nova Scotia mining men.

Two points, however, accentuated by two of the speakers, should always be borne in mind.

The first of these is that no government can afford to undertake work that should be performed by private individuals.

Secondly, co-operation amongst the operators themselves is essential to progress.

These, doubtless, are truisms. But they are important truisms.

Governmental paternalism weakens any industry. On the other hand, judicious assistance from the government, given at the right time and in the proper way, may galvanize a moribund industry into healthy and permanent activity.

It remains for the Mining Society of Nova Scotia to determine just what assistance the mineral industries of the Province require. And this is a question the seriousness and complexity of which must not be overlooked.

Bounties are temporary expedients. Tariffs have a larger field of application, and, in some instances, must be considered. But, more vital than these, is the necessity of *knowledge* of the extent and value of already discovered mineral deposits. This can be secured only by intelligent private enterprise, assisted by the Federal and Provincial Bureaus. Topographic and geologic surveying and diamond drilling are legitimate forms of government assistance. To these may be added the publicity given by means of official publications.

If, however, these official efforts are not utilized fully and promptly by the mining fraternity, they become worse than useless.

We would therefore urge the Mining Society of Nova Scotia to follow keenly the campaign laid out during its recent annual meeting. Nothing will be accomplished if matters are allowed to drift until next year. Even at the cost of much expense and inconvenience, monthly or, if necessary, fortnightly meetings should be held. There are not a few ardent workers in the Society, who do not receive the encouragement and praise due them. Their enthusiasm should be utilized.

Organized effort alone will bring Nova Scotia into the position that she deserves.

THE GRANBY CONSOLIDATED.

Stevens' "Copper Handbook" is an annual volume whose appearance is welcomed by copper workers the world over. As the work of one man, it is a monument of industry and intelligent discrimination. It is reliable and comprehensive. Of dubious enterprises it expresses its opinion unhesitatingly. Hence it is of extraordinary value to the investor.

It is pleasant to read Mr. Sevens' warm praise of a Canadian copper concern. In concluding a detailed description of the Granby Consolidated Mining & Smelting Company's mines and works at Phoenix and Grand Forks, B. C., Mr. Stevens speaks thus of the company's execution:—

"Both mine and mill have been brought to a high state of efficiency, and the cost sheet is one of which any directorate well might be proud. . .The Granby is one of the few copper properties of the world of which a careful investigation leads to the verdict that there is nearly everything to commend, and scarcely anything to criticise."

Mr. Stevens' praise is worth something.

TRANSVAAL STOPE DRILL COMPETITION.

We have received from the London secretary of the Transvaal Chamber of Mines the following communication to which we are glad to give a prominent position:—

Transvaal Stope Drill Competition.

"The Transvaal Government in co-operation with the Transvaal Chamber of Mines has arranged for a practical trial of small rock drills suitable for narrow stoping work under the working conditions obtaining on the Witwatersrand.

"All types of rock drill are eligible to compete. Drills using compressed air will be supplied with a pressure varying from 60 to 75 pounds per square inch at the working face. The mining regulations require the provision of dust-allaying appliances, and competitors must make provision accordingly.

"Two prizes, of £4,000 and £1,000 respectively, are offered. The trials and the judging will be so arranged as to decide which machine performs the most economical work.

"The competition will commence early in 1909, and entries will probably close with the end of 1908. The trials will last about six months, the drills being tested in the first instance on the surface, and those considered suitable being given a more prolonged test underground in several stopes in various mines on the Witwatersrand.

"The detailed conditions governing the competition, including the exact date of closing entries, will be published as soon as possible.

"All enquiries should be addressed either to:—The Secretary, Stope Drill Competition, Transvaal Chamber of Mines, Johannesburg, Transvaal; or to:—The London Secretary, Transvaal Chamber of Mines, 202, 203 and 206 Salisbury House, Finsbury Circus, London, E. C."

CLEAN ADVERTISING.

We have had occasion in the past to allude to dishonest and ilegal advertisments published in supposedly reputable newspapers. It has always been our contention that newspapers and, indeed, all periodicals are morally responsible for the fitness and decency of the advertisements that they carry.

It is therefore gratifying to mark the vigorous position taken by Mr. Medill McCormack, a Chicago journalist. Addressing the Canadian Press Association, Mr. McCormack spoke in part thus:—

> "The newspaper is only as clean as its advertising columns . . .We endeavor through our editorial columns to secure the confidence of our readers, and, having gained that confidence, we must not stand sponsor for any man who is not fit to come within the family circle. We must no more thinking of giving letters of introduction to the thief, or the liar, or a monger of filth than we would of giving a black-leg or a libertine a card to our clubs or inviting him to dine with our home folks."

THE CLIMATE OF KLONDIKE.

Distance lends enchantment to the view. Given some thousands of intervening miles, a writer may safely constitute himself an authority upon topics of which his knowledge is by no means complete.

In The Canadian Mining Journal of January 15, 1908, we drew attention to the general inaccuracy of the articles in dredging in the Yukon, written by Mr. J. P. Hutchins in the Engineering and Mining Journal of New York. Our criticism was offered with the utmost good will. Unfortunately Mr. Hutchins has chosen to take offense. In the Engineering and Mining Journal of March 1, he devotes five columns to us. Most of what he writes is—to say the least—not appreciative

In fact it may be fairly described as vituperative. Consequently it does not require further attention. But we regret that no attempt has been made to answer any of our criticisms.

That Mr. Hutchins' articles are misleadingly depreciatory may be inferred from his statement about the climate of the Klondike. To prevent misconception we shall quote this passage verbatim:—

'In the Klondike, May 1st. is about the earliest in normal years that dredging can begin; but owing to the superficially frozen ground, which is found even in the milder areas, such as the Klondike valley, it is rarely advantageous to begin so early. Besides even at that season the day and night temperatures approximate 50 degrees F. and —15 degrees respectively. Dredging can be continued until October 15th, when the day and night temperatures are about 30 degrees F. and —15 degrees F. respectively.'' We interpreted this in our criticism as follows:— ''The extraordinary statement is made that the average night temperature on the first of May and on the fifteenth of October is fifteen degrees below zero F.,'' which seems to us the only rational interpretation possible.

Mr. Hutchins in his reply, however, says, '' I said nothing about average temperatures. I cited figures to show the extreme night and day temperatures.'' We shall, for arguments' sake, allow Mr. Hutchins' version to stand, although these two statements are manifestly contradictory. But even his last statement is far enough from the truth to need serious correction. Fifteen degrees below zero has never been officially recorded in the Klondike either in May or October. The Canadian Meteorological Service has been taking temperature observations in the Klondike for a number of years. The lowest temperature that has ever been recorded officially in the Klondike in May is 5 degrees above zero F. and the lowest October record up to the 31st of the month (not the 15th) is 10 degrees below zero F. The weather therefore, at such times of the year, is not nearly so cold as Mr. Hutchins would like us to believe. In fact his damaging statement about the climate is but in keeping with the general tone of the whole article.

On several occasions it has been our duty to expose or correct inflated accounts of mining properties in different parts of Canada. It is equally our duty not to allow a grossly derogatory description of one of the greatest mining camps in Canada to go unnoticed and uncorrected.

"THE FALLS OF NIAGARA."

Some weeks ago we referred with pain to the possible publication of Dr. Spencer's ''Falls of Niagara.'' We spoke warmly, not that we wished to interfere with the worthy author's desire to see himself in print, but because we thought that the volume should not appear under the aegis of the Geological Survey of Canada.

However, the book appeared. We preserved a silence equalled only by our desire to express our feelings. That silence we shall observe. Yet we are forced to notice briefly a scathing review of Dr. Spencer's tome that appeared in a late issue of our exceedingly outspoken contemporary, *The Mining and Scientific Press*, of San Francisco.

The *Press* vivisects ''The Falls of Niagara'' in a style that is all its own. It rubs salt into the incisions. ''This,'' it remarks, ''is the delirious trimmings of scientific literature.''

To all this we shall say neither ''yea'' nor ''nay.'' But we shall point out one error into which our contemporary has fallen.

The credit (or otherwise) of the appearance of the volume under consideration lies neither with the Acting Director of the Survey nor yet with the brilliant and energetic editor. The latter, indeed, stands absolved from all complicity.

The facts appear to be that Dr. Spencer insisted upon holding the Survey to an ancient contract, made under a former regime. And in his preface the author, albeit somewhat obliquely, states that he himself, and only he, is the person responsible.

We hope, then, the the *Mining and Scientific Press* will relieve itself of the misconception that ''The Falls of Niagara'' is the acknowledged child of the Geological Survey. The Survey's child it is, but it was found upon the doorstep.

THE NEED OF PROSPECTING.

Mr. Leach, in his paper read before the Canadian Mining Institute, refers to the small amount of systematic exploration that has been done upon the Moose Mountain Range. If this is true of Moose Mountain Range, it is even more true of the other Ontario, Quebec and Nova Scotia iron ore districts. Mr. A. B. Willmott, in his excellent monograph on ''The Iron Ores of Ontario,'' makes a striking and effective comparison. He refers thus to the work done in one small section on the United States side of the Lake Superior country and contrasts it with what has been attempted in Northern Ontario: ''The amount spent on exploration on the Vermilion range alone, between Tower and Section 30, a distance of say thirty miles, probably surpasses all the money spent in actual exploration of the hundreds of miles of similar ranges in Northern Ontario.'' This fact is eloquent.

One of the conditions that hamper the development of Canadian iron deposits is the fact that owners usually stipulate for excessive royalties or grossly over-estimate the value and extent of their holdings. Another cause is the apparent unwillingness of Canadian consumers to grant reasonable terms to possible shippers. In other words, with one or two exceptions, there appears to be a decided diffidence on the part of Canadians in embark-

ing on the development of our iron ore deposits. The situation is a complicated one. But of this we are sure, namely, that Federal and Provincial bounties should be so adjusted as to encourage directly the use of Canadian ores.

MINERS' RELIEF SOCIETIES.

In the Province of Nova Scotia there are 12,000 colliery workers. At present there are sixteen miners' relief societies. The report of the Commission appointed some months ago to enquire into old age pensions and miners' relief societies, sets forth some of the weaknesses of existing relief societies. The entire lack of co-operation is, perhaps, the most serious drawback to the present system. The heavy cost of administration is also a hardship upon the miners.

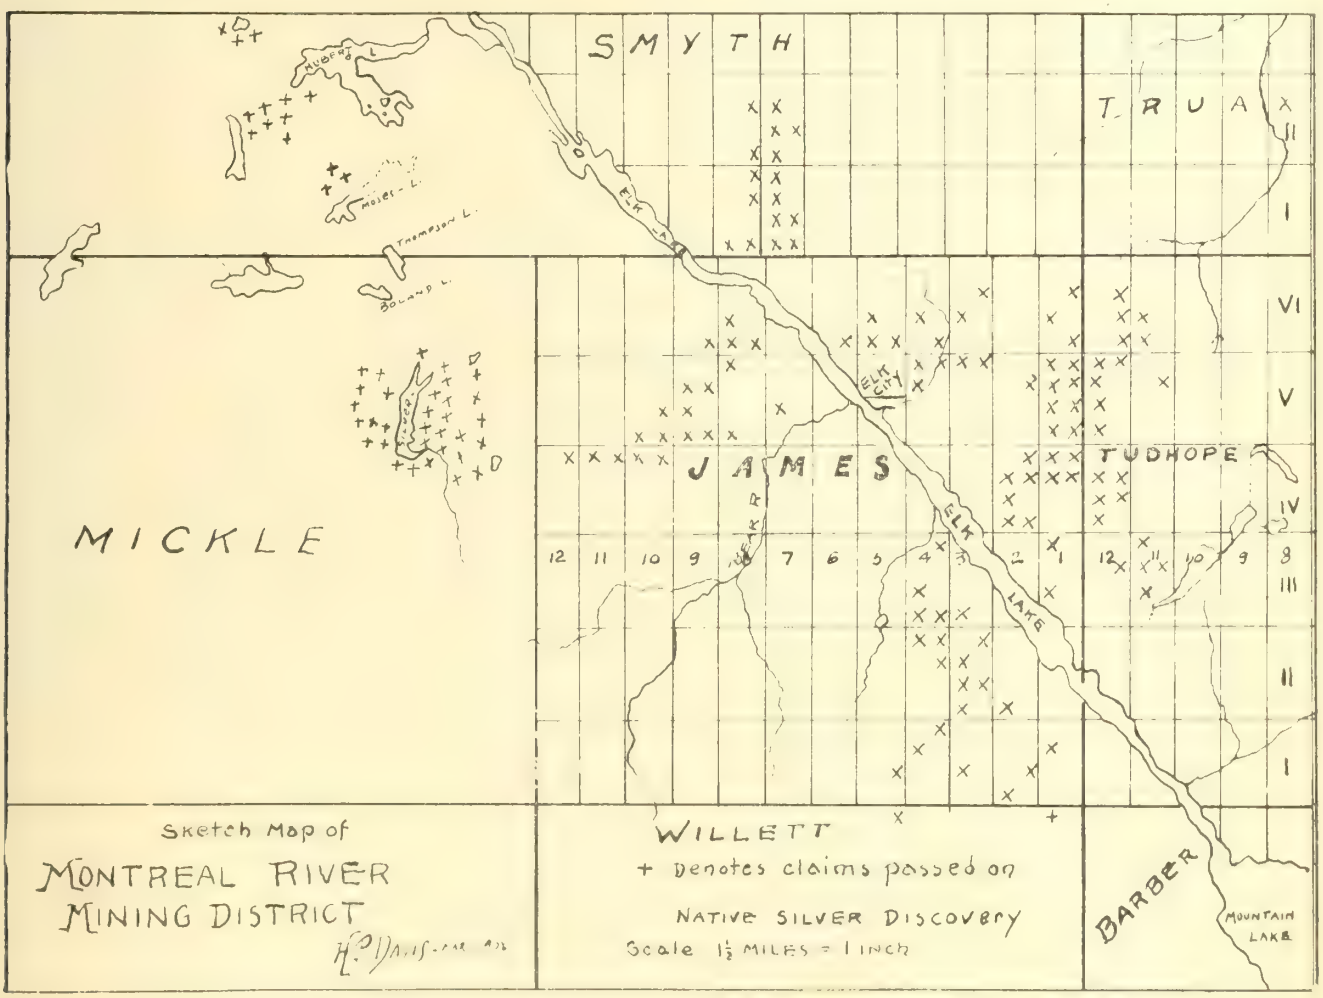
The Commissioner's report therefore recommends that the Government of Nova Scotia take over the management of the funds of the several societies in excess of $1,000, and that the societies themselves be organized into one large body with local branches.

We cordially agree with the idea of consolidation. The risk of insolvency will thus be reduced and the rates should become cheaper. But we see no justice in the claim that the Government should handle and administer the funds. It will be far better for all concerned, it will make for peace and mutual respect, if the miners' organizations control their own affairs. The suggested arrangement smacks of class legislation.

A CORRECTION.

Our Glace Bay correspondent has drawn our attention to an item that appeared in our last issue under Mining News of the World. The statement is there made that after the late Hamstead colliery disaster the rescue apparatus proved ineffective. This was by no means the case. Such a statement, indeed, is calculated to destroy the growing and much-needed confidence of operators and workmen in the apparatus used. In our next issue the matter will be given more attention.

THE MONTREAL RIVER DISTRICT.



By Harold P. Davis.

With one conspicious exception, there are no promotions in the Montreal river field, and few capitalized companies. The small amout of development work has been done by individuals. It is clearly understood by the owners and prospectors in the district that, with the present attitude of the investing public towards Northern Ontario mining fields, the development of this section depends upon their own efforts, and that there is little hope at present of obtaining assistance from outside sources. It is yet impossible to draw definite conclusions as to the persistence of the veins, or the depth of the silver enrichment.

With adequate funds devoted solely to development work, and the evidence of values which seemingly justify this development, the coming spring and summer should demonstrate whether the diabase areas in the vicinity of Silver Lake, Hubert Lake, and in James, Smyth, Tudhope, and Willet Townships, have or have not silver values in shipping and milling quantities. Strangely enough, although nothing is mineralogically exceptional in a region radiating from Cobalt, the values are seemingly confined to the diabase, and so far no evidences of silver and very few veins of any sort have been noted in the conglomerate upon which Cobalt primarily pinned its faith. If the development of the rich outcropping veins confirms the surface showings, and the sinking of shafts or diamond drilling demonstrates the values existing at depth, ample funds will be forthcoming, and there is no doubt in the minds of those familiar with this section that it will take but little of such work to prove up shipping mines. While the areas of enrichment have not been definitely determined, the district under immediate exploration extends from Mountain Lake to Hubert Lake; Elk Lake which is an expansion of the Montreal river intersecting them for a distance of fifteen miles.

Approximately twenty miles to the west, in the vicinity of Bloom Lake, there has been more or less activity with very favorable results. However, it is the six townships surrounding Elk Lake which will either register another silver camp in the Nipissing district, or a mineralogical freak. The areas of diabase and gabbro disclosing silver, smaltite, and associated minerals, include that portion of James township from its north west corner along the south bank of the river to the southeast corner. The area along the boundary of James and Tudhope includes lots 1 to 4 in the former; and lots 12, 11 and 10 in the latter, the section north of the river in lots 4, 5, and 6 in James; lots 7 and 8, concessions I and II Smyth; and the territory extending from Hubert Lake south through Thompson and Boland Lakes to Silver Lake. It has been remarked that the richest sections are generally in the narrower bands or belts of diabase which are outlined by quartzite and granite, the prevailing rocks of this district. The vein matter is calcite, barite, or aplite. The silver which probably was carried up with the vein filling occurs as leaf and fine grains. These veins are from a few inches to two feet in width and carry in places from a few ounces to several thousand ounces of silver. The calcite veins vary in width from narrow seams to 18 or 20 inches, and are in many instances decomposed on the surface, the silver being found in fine grain and leaf disseminated through a black muck. A pit sunk on one of these veins a few feet in depth usually reaches the rock calcite which carries as a rule a varying percentage of chalcopyrite, and in many cases smaltite and niccolite. There are also a number of outcropping veins of

specular iron often carrying small amouts of silver and in some instances showing native silver. In the narrow diabase tongue in lots 7 and 8 in Smyth rich veins have been located. Out of the sixteen claims in lot 7 concessions I and II all are passed, and nine have native silver finds. In lot 3, concession VI, James, on one of the seven claims of the Montreal River International Mines passed on native silver discovery, a vein of calcite uncovered for over four hundred feet exists in the contact between the conglomerate and diabase which is 14 inches wide, and carries smaltite, niccolite, and a little silver. In lot 7, concession I, Smyth, on another claim belonging to this company a vein 18 inches in width with a barite gangue has a streak of calcite 3 inches wide containing smaltite and native silver along the hanging

wall. Native silver also occurs in the barite but is more generally distributed in the calcite. A shaft has been sunk on this vein to the depth of fifty feet, and drifting at this level showed the vein equally strong as at the surface. The barite at this depth is largely replaced by calcite.

On the property of the Moose Horn mines north of Elk City in James township a number of rich narrow veins carrying high silver values are being developed. In the northeast corner of James township, on the Meyer and Ellis claims, are some promising veins of aplite. Native silver has been found in four leads in this group one of which is eighteen inches to two feet wide and has been uncovered for four hundred feet. The Munroe and Mitchell, the Harbeck, and the Bradshaw and McVittie claims in this section all have native silver in calcite or aplite veins, which also generally carry a large percentage of chalcopyrite. On the Gates claim in lot 8, concession VI, James, nuggets of silver weighing over fifty pounds have been taken out, while the values are reported to have pinched out in this vein at the depth of fifteen feet, the loss of values in a narrow vein of calcite in the one test pit sunk is not by any means to be taken as a fair test. From the surface indications it would seem that this property has a good chance of proving valuable. South of Gates in lot 8, concession V, on one of the Downey claims is a four inch vein of calcite and silver which compares favorably with the veins in Cobalt. Active work will begin on this claim in the spring. Sixteen claims in this vicinity have native silver showings. On a large percentage of the claims in the diabase area in the vicinity of Silver Lake, native silver has been found. Four out of five of the claims belonging to the Clinton and Steindler Syndicate have one or more veins showing native silver, and the fifth a galena vein eighteen inches to two feet wide which runs 37 1-2 per cent. lead with a little silver.

A vein which showed cobalt bloom and decomposed calcite on the surface, turned to rock calcite, smaltite and silver in a few feet. Specimens from this vein are difficult to distinguish from the typical high grade ore from Coleman township. Otisse Brothers have three high grade silver veins on a lot west of the lake adjoining Clinton and Steindler, one of 4 inches in width which carries high values. These discoveries were all made

by the Otisse Brothers with prospecting picks, and practically no trenching has been done. The richest vein in this section yet discovered is on the Shane-Downey lot southeast of Silver Lake, the title of which is now in dispute. The vein matter is aplite and was recently described in a report written by an eminent authority on Canadian mining fields as being six to eight inches wide, and carrying twenty-five per cent. silver. A total

Camp on Bear Point.

of twenty-nine out of thirty-seven passed claims in the vicinity of Silver Lake have native silver discoveries. The cross marks on the sketch map which accompanies this article indicate claims upon which have been made one or more discoveries of native silver. A line drawn round and including these claims would approximately outline the diabase areas of the Montreal river district, and at the same time include all the important discoveries so far mode. This area would be greater than the proven field in the Cobalt camp.

Owing to a most unfavorable combination of circumstances very little systematic prospecting has been attempted. The first discovery in this district made in the fall of 1906 was not followed up in time to see much work accomplished before the winter set in. The late

A Prospector's Tent.

spring and exceedingly wet summer of 1907 made prospecting difficult. However, some important discoveries were made this winter in spite of the snow. The arrangements which have been entered into for the inauguration of extensive work on a number of the most important properties as soon as the snow leaves the ground, and the rapidly increasing number of outfits entering the field with supplies and equipment indicate that the proving of this district will shortly begin in earnest. Whilst the fact that conditions do not favor a repetition of the Cobalt "boom" may possibly delay the early development of the Montreal river district, there can be no question that this will make for the ultimate good of the new camp. Specimens of ore such as are reproduced on the title page of this issue of The Canadian Mining Journal, while not to be taken as average samples of the discoveries, are sufficiently characteristic of this district as to be distinctly encouraging. An engineer who is recognized as one of the foremost authorities on the mineral deposits of Ontario stated recently in a report to his company: "It seems more than probable that in the coming summer when the conditions for discoveries and prospecting will be more

Winter scene at Silver Lake.

favorable that many wider and richer veins will be found. The region is one of great and wonderful promise."

At present the only means of reaching this district is by the winter road from Earlton on the T. and N. O. R. (Government Railway) through the townships of Armstrong, Beauchamp, Bryce and Tudhope, to Elk City in James, a distance of thirty two miles. As soon as the ice is out traffic will be by boat up the Montreal river from Latchford, a station south of Cobalt on the T. and N. O. R. R., about fifty two miles southeast of Elk City. Two lines of small steamers will be operated. It is practically assured that the Charlton branch of the T. and N. O. will be extended to Elk City, a distance of seventeen or eighteen miles, as soon as sufficient ev-

dences of the importance of the mineral deposits are given. Already two rival towns have sprung up, and over one hundred and fifty lots have been sold by the company that controls "Elk City", the town site on the northeast bank of the river. A comfortable hotel and several store buildings have been built. On the opposite bank of the river at Bear Point is "Smyth", a town site reserved by the government, and which is being sold by sealed tender. Here also a number of substantial buildings have been built, and it is understood that the Recorder's office of the Montreal River Mining Division will shortly be removed from Latchford to "Smyth" in order that the inconveniences entailed by long jour-

The Downey Claim, Near Silver Lake.

neys may be obviated. A few miles south on Mountain Lake a sawmill is in operation providing lumber for construction purposes.

Considering the fact that practically no systematic development work has been attempted, and that last season was by far the most unfavorable for prospecting for many years, this new silver camp has made a record that warrants a favorable belief in its future, and a belief that the spring and summer of 108 will see the development of a new mining district in northern Ontario, which will be an important factor in the silver production of the Dominion.

SUBMARINE COAL MINING.

By John Johnston, Sydney Mines, Cape Breton.

(Paper read before the Mining Society of Nova Scotia, 25th March, 1908.)

In preparing a paper upon the above subject, it is impossible to deal exhaustively with the many different phases which may present themselves, but for the present this paper will simply deal with the matter in a general way.

As is undoubtedly known to mining men, our principal heritage along the eastern seaboard of the County of Cape Breton is the valuable coal seams, from some of which the coal has been extracted for more than seventy years. The coal has been almost all taken from the land areas, and the quantity mined has increased in proportion to the demands of trade.

In 1902, the attention of Mr. H. M. Whitney and other capitalists was drawn to the rapidly increasing demands for coal, the possible expansion of the trade, and the necessity of reducing the cost of production, which eventually led to the amalgamation of a number of coal companies (whose operations as individual companies were not always attended with satisfactory results) into what has since been known as the Dominion Coal Company, Limited.

To the companies thus depending entirely upon water communication to reach a market for their product, conditions presented themselves which seemed beyond control, viz., shortness of shipping season and the need of a regular and continuous market, which subjected their business to extreme fluctuations, from producing all that was possible during the season of shipping, to enforced idleness during the winter months.

All this has been changed by the energetic action of far-seeing men, and since 1897 new markets have been found at home and abroad, requiring a constant supply of coal. Trade has expanded beyond the most sanguine expectations, and as a result collieries are required to work continuously, and labor has been given, not only to those who hitherto were compelled to remain idle during a large portion of the year, but to a largely increased number.

Up to the present there has been but little done in the way of submarine mining, except by the General Mining Association of London, which has been absorbed by the Nova Scotia Steel & Coal Company, which is at present continuing the workings. Mr. Henry S. Poole, of Halifax, N.S., read a paper before the Institute of Mining Engineers of England, at a meeting held at Nottingham, England, on September 3rd and 4th, 1903, and which is to be found in that society's transactions, in which he clearly set forth the conditions under which the coal in these submarine areas was then being extracted. The writer has much pleasure in confirming all that Mr. Poole has said relative thereto.

But a new condition of things is arising: certain well-known seams are rapidly being worked out on the land areas, and the necessity of generally extracting the coal from the submarine areas of our country, greater by far in quantity than that originally contained in the land areas, is becoming acute.

Naturally the question now is, not so much one regarding the extraction of coal from a submarine area extending about a mile from and parallel to the adjoining shore, but how should the operations in leases next to the shore line be undertaken, so as to enable investors to reach out several miles from the shore to extract coal therefrom, that they may have a fair return for the money invested; also, how should we guard with safety all those who may be engaged in the prosecution of the work, and how may we win the greatest possible quantity of coal from those areas, leaving uninjured the outlying properties and successfully meeting the requirements of trade?

These are problems of the highest interest, and in the proper solution of which, it appears to the writer, are involved matters that might be the duty of the government to investigate.

Extending for a distance of forty miles along the eastern seaboard of Cape Breton are coal-bearing strata, upon which, until a recent date, no submarine leases were granted, excepting those to the General Mining Association at Sydney Mines, at Barasois and at Lingan, to Charles Campbell at Burnt Head, and to the Blockhouse Company at Cow Bay. Recently, a large number of leases extending miles seaward have been applied for and granted—in fact all the distance mentioned has been covered. The descriptions in the leases have not always been accurate or clear, and litigation has arisen as a consequence, and more is likely to follow.

Two questions might here be asked. First: Why were not proper monuments for reference established, so there could not be any doubt about the location of each and every lease or area, whether submarine or land? And, second: Will not a large amount of coal be lost if the present apparently unsystematic distribution of coal leases is not modified?

In England, where this question has had the careful consideration of mining men for years, it has been demonstrated beyond a doubt that not only can coal be mined successfully in submarine areas in the usual way by bord-and-pillar, but, under certain conditions, all the coal can be extracted therefrom. It has also been demonstrated that the extraction of coal from submarine areas can be successfully done at quite a long distance from the shore line, as instanced at the White Haven collieries of Cumberland County, England, and several other places where coal is being extracted and drawn a distance of four or more miles. There the principal difficulty appears to have resulted from the number of faults, dislocations, anticlines and synclines which were encountered. So far as is known, the submarine areas of Cape Breton County are entirely free of any such conditions, and therefore are of very great value from a commercial standpoint.

In the mind of the writer, some of the principal questions to be considered (in addition to any that may have already been mentioned) are as follows:—

1st—How should this territory be successfully opened up so as to leave sufficient protection, and so as to extract coal five or more miles from the shore line in a manner that would give a fair return to the investor?

2nd—What is the best method of providing for ventilation, safety of workmen, haulage, and the extraction of the largest possible quantity of coal grom the several seams at this distance?

3rd—Where pillars are required to be left, what size should they be?

4th—Under what conditions should the different sections of a mine be worked?

5th—Can all the coal be taken in the first workings?

6th—Under what conditions can all the coal be extracted?

7th—What would be the proper method of procedure to lay out a mine in a submarine area where all the coal is being extracted?

8th—What is the most efficient method of ventilating workings in a submarine area, where coal is being extracted, two or more miles from the shore or exit?

9th—What is the most efficient system of haulage from submarine areas two or more miles from shore or exit?

10th—What is the best method of taking workmen to and from a given point two or more miles from shore or exit?

THE SIXTEENTH ANNUAL MEETING OF THE MINING SOCIETY OF NOVA SCOTIA.

Held at Halifax, March 25-28, 1908.

As indicative of the growing interest manifested in the annual meeting of the Mining Society of Nova Scotia it may be mentioned that four instead of two days, as heretofore, were necessary for the transaction of business, reading of papers, and social amenities. The attendance was large, the papers were timely and the discussion representative, although far too little time was assigned to this last item.

On Tuesday evening, March 24th, the annual meeting was opened informally by a "smoker" in the comfortable rooms of the Society's headquarters.

The formal opening took place on Wednesday morning, March 25th, in the commodious council chamber of the Halifax Board of Trade, which immediately adjoins the Society's quarters. As mentioned above, the attendance was good. In addition to the regular members

there were many guests from other parts of Canada and from the United States. Amongst these were Mr. R. W. Brock, Acting-Director of the Geological Survey; Dr. Eugene Haanel, Director of the Mines Branch, Ottawa; Dr. W. G. Miller, President of the Canadian Mining Institute; Messrs. Hugh Fletcher, E. R. Faribault and Leech of the Geological Survey; Dr. E. W. Parker, representing the United States Geological Survey; Mr. McLeish, Statistician of the Mines Branch, Ottawa; and Mr. J. C. Murray, editor of The Canadian Mining Journal, Toronto.

President C. J. Coll's address, entitled "Remarks on Some Recent Explosions in Coal Mines" was a valuable, lucid, and powerful review of recent coalmine catastrophies. After outlining the causes of these disasters, the address concluded with recommendation as to necessary regulations to be enforced in coal-mines. The whole address is reprinted in this issue if The Canadian Mining Journal.

Dr. Parker and Dr. Haanel discussed the president's paper. after which routine business was transacted.

President C. J. Coll.

The Wednesday afternoon session was followed in the evening by the Annual Dinner held in the St. Julian room of the Halifax Hotel. About one hundred and fifty covers were laid. Music was supplied by the band of the Royal Canadian Regiment. The speeches, all of which were admirably brief, were of unusual merit. Whether it is the proximity of the Atlantic Ocean or fish diet or some other factor unknown it is profitless to guess; but the truth remains that Nova Scotians speak fluently in public. Moreover, their hospitality induces eloquence in their visitors.

In responding to the toast of "Canada" Lieutenant-Governor D. C. Fraser referred to the Dominion's magnificent opportunities for development in the next twenty five years. The Hon. O. T. Daniels, M. P. P. speaking to the toast of "Nova Scotia" alluded to the sterling work done by the Mining Society. The Society, Mr. Daniels stated, had more than justified its existence by securing for Nova Scotia a system of technical education. Speaking to the same toast, Mr. C. E. Tanner, M. P. P. leader of Nova Scotia's loyal opposition congratulated the Society upon the earnestness and whole-heartedness with which it had attacked the problem confronting it.

The Hon. C. P. Chisholm, Commissioner of Works and Mines, responded to the toast of "Our Mineral Resources." He was followed by Judge Drysdale, a former occupant of that office.

Dr. W. G. Miller, President of the Canadian Mining Institute, spoke to the toast of "Our Sister Societies." "Our Guests" was responded to by Dr. E. W. Parker, Dr. Eugene Haanel and Mr. R. W. Brock. Other speakers were Mr. Hugh Fletcher, Mr. Badger, Mr. Faribault, Mr. J. C. Murray, Mr.W. W. Leech, Mr, H. E. Coll, Mr. H. Piers, Mr. F. H. Sexton and Mr. H. M. Wylde.

So well arranged was the whole affair that all making of speeches was over by midnight.

Part of Thursday's and Friday's sessions were devoted to the discussion of what had been chosen as the keynote of the meeting—the exploration of Nova Scotia's mineral resources. Dr. Haanel, Mr. Brock, Dr. Miller and Dr. Parker spoke inspiringly upon the work of the bureaus that they individually represented.

Beside the regular papers read, Dr. Miller on Thursday afternoon delivered, before a large audience, a lecture on Cobalt. After showing Cobalt's relation geologically to the surrounding sections of Ontario, he traced its history and development. The lecture was illustrated by lantern slides.

An incomplete list of papers read and discussed or read by title is:—

W. J. Priske—"The West Gore Antimony Mine." H. E. Coll—"Shaft Collar at No. 1 Allan Shaft." A. L. McCallum—"The Testing of Nova Scotia Fire Clays." H. S. Badger—"The Mining and Metallurgy of Gold at the Boston-Richardson Mine." T. J. McKavanagh—"Electricity in Mining." A. A. Hayward—"Gasification of Fuel." J. E. Woodman—"The Financial Value of Economic Geological Studies." E. Percy Brown—"Structure of the Ore Body of the Boston-Richardson Mine." J. Read—"Recent Cyanide Practice in Mexico." J. E. Woodman—"The Mapping of Mining Properties." A. A. Hayward—"The Occurrence of Primary and Secondary Brines."

The election results, announced on Friday afternoon were as follows:—President, Mr. C. J. Coll; 1st. Vice-President, Professor F. H. Sexton; 2nd. Vice-President, Mr. T. J. Brown; Sec-Treasurer, Mr. H. M. Wylde; Council, Messrs. R. H. Brown, A. Dick, G. W. Stuart, Jacob A. Johnson, B. F. Pearson, Hon. R. Drummond.

A PRACTICAL SUGGESTION FOR THE TESTING OF THE GOLD MINES OF NOVA SCOTIA.

By Fred. P. Ronnan.

Editor "Industrial Advocate."

(Read before the Mining Society of Nova Scotia, 25th March, 1908.)

Various plans have been suggested for the encouragement of gold mining in Nova Scotia, and the necessity for taking some practical steps in the development of that branch of the mining industry will be admitted without debate by all persons who have witnessed the slow and irregular progress of the past ten years in Nova Scotia. It is to the credit of the government of Nova Scotia that it has signified its willingness to extend any reasonable measure of financial assistance that may be

necessary, and this desire has found expression in the placing on the statute books of Nova Scotia an Act directed to the extending of financial help to mining operators of responsibility and standing, who will undertake to carry on deep mining.

So far as it goes, this is praiseworthy, but no move has yet been made by capitalists to take advantage of this exceptionally favorable proposal; and to any person who has devoted a reasonable amount of time to the study of what is required in this province, it is plainly manifest that some more practical means of realizing on our great mineral deposits must be put into force, not only through the initiative of persons engaged, but in the necessary oversight by the authorities. It would be idle to recall to the reader's recollection the various facts which have been proved in connection with the wide extent and distribution of the gold-bearing deposits of this section of Canada. These are patent to persons who have made only a cursory study of the subject; and in fact, as one authority has frequently put it, the chief trouble with Nova Scotia is that there are so many openings and opportunities for the investment of capital in gold mining, effort and capital are in consequence divided, and the result is a want of concentration, which on one or two properties would prove them to be very successful and object lessons to those who think that our gold deposits have only a limited range in depth and value. There are without doubt in this province to-day, as many as a thousand "gold mines," so-called. To the owners, no doubt, they are such, but in the opinion of the hard-headed, matter-of-fact mining engineer they are but prospects, and as such will remain, unless development work is undertaking on the best possible lines. Almost all these properties have had more or less money expended upon them, much of it wasted so far as actual results are concerned. The majority of them have engineer's reports concerning their value and extent, but still the industry lags, and Nova Scotians possessing, as they do, a splendid mining country, are last to become interested financially in the proper development of these deposits. Indifference and dishonesty there are in all mining sections of the world, and if we suffer from either one or the other, or both of these conditions, we are not alone in this respect: but there is a remedy for even these causes, and I propose to submit to the mining men of the province and others interested a plan which I think might at least be found worthy of trial, or at all events worthy of criticism from the standpoint of the desire to improve our present position, as a producer of precious metals. In view of the fact that political elements will enter into even the most carefully restricted questions, and that further, sectional jealousies are always more or less apparent, it is necessary that a suggestion to improve mining conditions must be based on some plan by which these considerations will be eliminated, and I submit as the result of some study of the question, the following plan, which while not put forward as one that is absolutely perfect or free from flaw or objection, is one which seems to me fairly well calculated to meet a condition as it exists to-day in this most important industry.

If I had the honor and responsibility of filling the chair or Department of Mines in Nova Scotia, I would start the ball rolling by inviting the attention of all practical mining men to the fact that the government is prepared to undertake gold mining development with the sole object in view of creating a very much wider measure of interest in the same than at present exists. I would next issue an invitation to all owners of gold mines throughout Nova Scotia to forward to my department within a certain date, as complete a description of their property as they could furnish, accompanied by maps, mill returns, etc., and also an offer in a formal way, of the property to the government at as low a price as they consider they could accept. I would ask them each to specify that the government would have the right to a three year's working option, if required, without charge.

I have not the slightest doubt that the response to such an invitation would be a most generous one. I would employ two or three practical mining engineers who have had the necessary training in picking out prospects which promise the making of good mines, and whose judgment in nine out of ten cases is usually found correct, as verified in many western camps. I would then take the most promising property selected by those experts, one from each district, and on a certain day to be determined, in the presence of those interested, I would draw by lot the property to be exploited. In this manner I would avoid, as far as possible, any charge of partiality toward any district or any one property, and I believe it would be the only way to determine which one of, say a dozen properties, each equally promising, should enjoy the first attention. With the property selected, then I would map out, or have my engineers plan a scheme of development for the purpose of placing in sight bodies of ore, and in short the making of a mine. I would then ask for an appropriation of sufficient money to carry on this work and see that it was prosecuted vigorously and scientifically to its logical conclusion.

We will assume, for instance, that after selecting the property in this manner, that it has been decided in consultation to spend up to the sum of $50,000 in making a mine of this prospect, and assuming further, that as the result of six month's careful underground work the results are satisfactory from an engineer's standpoint in the way of producing a measureable pay ore body, then I would hand the property back to the original owner and relinquish the option of purchase, letting him have the benefit of the expenditure so far incurred, and which had not resulted as expected, leaving him to carry on any further work.

I would then repeat the operation as already described on another property, and we will assume, for illustration, that the second property as the result of the expenditure of, say $50,000, within six months is so far satisfactory as to warrant a still further amount, and we will assume that conditions keep improving, and that after two years' working we have made a mine which may be submitted to the most exacting tests required by competent mining engineers, then I would as Minister of Mines inform the owner that the government would exercise its option of purchase on the price first agreed on, and the property would then belong to the people of Nova Scotia, together with all improvements. If it were thought necessary to carry on the development still further, very good. But if already in a position to be called a mine, then I would cause to be prepared a full, frank and complete statement of the property, describe it in detail, illustrate its ore occurrences, the tonnage of ore that had been developed, and such other facts as may safely be predicted by an undertaking of this kind. I would advertise this property in the leading mining and financial journals of England, Europe, United States and Canada, stating that on a certain date in the future this property, as described, would be offered for sale by public auction to the highest bidder, thus provoking com-

petition from the keenest mining investors all over the world and backed by the unquestionable evidence of actual ore bodies blocked out, and with their qualities, there would be little difficulty, in my opinion, in effecting a sale at a price far beyond the original cost of the property and the improvements. The sum derived from such a sale would then be turned into a fund for repeating the operation indefinitely in the various districts as fast as they could be reached, thus permitting an absolutely necessary work being carried on without cost to the government, and focusing attention upon one of the most valuable possessions which this province enjoys, viz., its undeveloped gold resources. The operation would then become continuous, and with the steadily added string of mining properties which had been proved beyond question, would come a very great revival of interest and enthusiasm in our properties, and it might even be unnecessary for the government to continue the programme unless its merits had entitled it to a foremost place as a practical method of progress.

The above is a hastily outlined sketch of what I think I would be very strongly tempted to undertake if I were to be placed in a position to do so. I submit it to the consideration of the members of the Nova Scotia Government, and in particular to the Hon. Mr. Murray and his associates, who, I am sure, have the future development of the country at heart, and while there may be, and doubtless are, minor obstacles in bringing about such a measure of improvement, yet I do not believe they are great enough to be considered insuperable. If there are any arguments, objections, unforeseen contingencies, or any other possible obstacles in the way of putting such a plan in practice, I invite most earnest the criticism, friendly or otherwise, of this plant. I believe at the present writing that it is entirely feasible and within the reach of practical application, and I cannot conceive of any other than a favorable outcome to such an attempt, but in case there should be, I would be glad to review whatever objections may be urged against a trial at least of the methods suggested. We ask the mining men of this province to take up this matter seriously. Study it in all its bearings, and let us have as full a criticism of the subject as it will be possible to make. The matter could be extended to many more pages, indeed, by the addition of detail, not necessary to the present outline, but the main skeleton of my plan is shown above, and could be readily approved or disapproved at less cost than any other method, more particularly that which depends on the unorganized individual attempts to mine gold in Nova Scotia with insufficient capital, inadequate knowledge and very often incompetent management.

REPORT OF THE DEPARTMENT OF MINES, NOVA SCOTIA.

For the year ended September 30, 1907.

In our last issue we published the statement of the mineral production of Nova Scotia during the past fiscal year and noticed editorially the general aspect of that province's mineral industry. But the 'Report' calls for more attention than it was then possible to give.

From October, 1906, to July, 1907 the province paid in bonuses on each ton of coal consumed in the manufacture of iron and steel in Nova Scotia, the amount of $40,331.45 of which the Dominion Iron & Steel Company received nearly three-quarters. The remainder was divided between the Londonderry Iron & Mining Company and the Nova Scotia Steel & Coal Company. The Dominion Iron & Steel Company receives 6 1-4 cents per ton; the other two companies, 5 cents.

Coal.

The returns of coal sold during the year 1907 show, compared with the returns of 1906, as follows:

	1906	1907
Nova Scotia	1,962,206	1,842,419
New Brunswick	434,882	427,128
Newfoundland	149,506	146,502
Prince Edward Island	76,809	77,493
Quebec	1,739,308	1,709,592
West Indies	.....	2,598
United States	769,775	616,312
Mexico	.....	7,591
Other countries	62,104	12,483
Bunker	.....	204,572
Total	5,194,590	5,046,690

The reports of the deputy inspectors on the collieries of the province are given in full. They contain much useful information; but are somewhat diffuse. In looking over them we notice some facts that are significant. We shall group these facts under separate headings and thus cover the field roughly.

Lamps.—Bonneted Marsaut lamps are used at the Springhill collieries. They were introduced in March 1891. 1300 are on hand in the lamp house and 1,150 are in use. The Marsaut is supplied with double gauze chimneys,

At Joggin's Mines Meuselers are used. They were introduced in January, 1904 and 200 are in commission.

The Chignecto mines use open lights. The slope is down 1,800 feet. The Minudie also use open lights.

The Dominion Coal Company's Dominion No. 1 colliery has used closed lights since 1903. There are 750 Ackroyd and Best safety lamps here, of which 600 are in use.

The use of the safety lamps was commenced at the Sydney No.1 colliery of the Nova Scotia Steel & Coal Company in 1897. There are now 680 Marsaut safety lamps in daily use. At the same company's Sydney No. 5 colliery there are 173 Marsauts.

The Port Hood colliery uses open lights. The Mabou and Gulf Coal Company and the Inverness Railway & Coal Company also are without safety lamps.

The Intercolonial Coal Company 18 years ago began using safety lamps. 640 Marsauts are in commission a reserve of 120 is kept in stock.

The Acadia Coal Company uses, at their Vale colliery, a total of 272 safeties, of which 78 are Marsauts, 64 Mueselers, and 130 Clannys. At their Marsh mine open lights are used. The Wolf safety lamp (self lighting) is used at their Acadia colliery to the number of 220, 385 of these lamps are used at their Albion mines.

The Dominion Coal Company's Dominion No. 2 colliery is equipped with 1,000 Ackroyd and Best safeties. These have two gauzes and are lighted and unlocked by electricity. Dominion No. 9 has 600 of the same type. At the Hub colliery 100 Hughes safety lamps are employed. There are also 738 Ackroyd and Best lamps at the Caledonia colliery, 500 at Dominion No. 3 colliery, 220 at the Emery colliery and 1,076 at Reserve. At Dominion Co. 6 there are 324 Marsaut safeties.

Hiram Donkin, Esq.
Deputy Commissioner of Mines for Nova Scotia.

Explosives:—

Colliery and explosives used	Output of Mine. Tons
Springhill No. 2, Springhill No. 3, dynamite	339,039
Joggins mines, black powder	50,385
Chignecto mines, black powder	44,143
Minudie mine, No. 3, black powder, American blasting powder, dynamite	44,107
Sydney No. 1, Sydney No. 3, Sydney No.5, "Bull Dog"	664,484
Port Hood, No. 3 black	76,083
Inverness Ry. & Coal Co., black powder	261,004
Allan Shaft No. 1, Monobel powder, Vale, No. 3 black, Marsh mine, No. 3 black, Acadia, none, Albion mines, Monobel	385,006
Dominion No. 1, Bulldog, Dominion No. 2, Excelite, Dominion No. 9, Bulldog, Hub, Bulldog, Caledonia, Bulldog, Dominion No. 3, Bulldog compressed, International, Bulldog compressed, Emery, Bulldog and Balfurite, Reserve, Bulldog and Excelite, Dominion No. 6, Bulldog	3,456,937
North Atlantic, Bulldog (loose) and Acadia pellet	981

The composition of Monobel powder, manufactured by the Nobel Explosive Company of Glasgow, is given as follows:—

	Maximum	Minimum
Nitrate of ammonia	82	78
Nitro-glycerine	11	9
Woodmeal (dried at 100 degrees C.)	10	8
Moisture	2½	½

Gold.

The production of gold during 1907 was 15,006 ounces. For 1906 it was 14,079 ounces. The gold produced, excluding that obtained from the antimony ore shipped from West Gore, was 13,687 ounces, valued as $260,053, extracted from 64,657 tons of ore, representing an average return of $4.02 from each ton of ore mined and milled. Compared with 1906 this shows an increase of 639 ounces of gold cecovered, 162 tons of ore milled and 18 cents in value per ton. Twenty four mines were operated and 483 men employed. In two districts, Gold river and Middle river, new properties were opened up.

Wages.—The average wages paid to the different classes of labour, skilled and unskilled, at the different gold mines in the province, is as follows:

	Per day.
Shift bosses	$2.00
Machine drill men	1.75
Machine helpers	1.50
Timbermen	1.75
Trammers and muckers	1.40
Engineers	1.60
Blacksmiths	2.00
Blacksmith helpers	1.50
Amalgamators	2.50
Millmen	2.00
Ordinary labour	1.35

Cost of Coal.—The cost per ton of coal at the boilers of the different gold mines throughout the province varies greatly, and depends principally upon the method of transportation, distance of the mine from tide-water or railway station, and quantity purchased. The following figures in this connection, covering over half the gold produced during the year, may prove of interest.

To mine and mill 51,725 tons of ore from which 8,156 ounces of gold were extracted valued at $154,964.00 or $2.99 1-2 per ton, 7,097 tons of coal were used costing $26,418.05 or $3.72 1-4 per ton, being $0.51 for each ton of ore mined and milled, $3.24 per ounce of gold extracted or $0.17 for every $1.00 worth of gold recovered.

Guysboro County.—Boston Richardson Mining Company, Isaac's Harbour. Employing 104 men this mine produced 43,456 tons of ore, yielding on the plates and by cyanide 6,504 ounces of gold, an increase of 1,685 ounces of gold extracted.

Minnie Miller Lead, Moose River Caribou.

Mining is done mostly by contract. Last year's prices for different classes of work were as follows:

Sinking incline shaft..$12.00 per foot, shaft 23 x 10 feet.
Driving ....4.25 per foot between walls 9 feet high.
Stoping ....18 cents per superficial foot through the belt.
Cross-cutting..... .....$4.50 per foot, 10 feet wide, 7 feet high.

In sinking, drifting and cross-cutting, the contract includes breaking down and delivering ore to the skip. The contractors supply steel, dynamite, light and general supplies; the company providing drills, hoisting and tramming facilities, timber when necessary, and air at 90 pounds pressure, at drills. Drill parts broken or lost are charged against the contractors. The management at the mine state that this method is giving splendid satisfaction, both to men and company.

The cyanide plant produced 1,101.12 ounces of bullion out of the total of 6,504 ounces.

Several shipments of concentrates have been made to Germany for arsenic extraction tests. If these prove satisfactory a plant will be erected at the mine.

Beaver Hat Gold Mining Company, Lower Seal Harbour. Twenty men are employed. A total of 1936 tons crushed yielded 635 ounces of gold. The mine was closed for 1 1-2 months on account of shortage of coal and three months during construction operations. The mill is equipped with ten 800-pound stamps.

McDonald and Copeland (Modstock) Forest Hill. Thirty six men employed. From 155 tons of quartz mined and crushed 375 ounces of gold were extracted.

The Wine Harbour Gold Mining Company, Wine Harbour. Forty two men employed. 6,333 tons of ore crushed yielding 1,017 ounces of gold.

Halifax County.—Ecum Secum Gold Fields Limited. During eight months 456 tons of ore were crushed giving 339 ounces of gold.

Harrigan Cove Gold Mining Company, Harrigan Cove. 1,267 tons of ore yielded 259 ounces 10 dwts. of gold.

Dominion Mining Company, Tangier. 647 tons of quartz yielded 201 ounces 15 dwts. of gold.

Dixon Mine, Caribou. From 174 tons of quartz crushed, 119 ounces 18 dwts. gold were extracted.

Consolidated Mines of Canada, Moose River. 2,895 tons of ore returned 219 ounces of gold.

Oldham Sterling Gold Company. From 362 tons of ore, 853 ounces 3 dwts. of gold were extracted, a yield per ton of 2.36 ounces. During the two months of August and September the returns show 67 tons crushed and 274 of gold extracted, or almost 4.01 ounces per ton.

Lunenburg County.— Chester Basin Gold Syndicate. From 761 tons of quartz a total of 926 ounces 9 dwts. was obtained. Hand steel was used. The mine is operated wholly by water power.

Reardon Reeves Property. A crushing of 72 ton 16 cwts. of quartz gave 278 ounces 12 dwts. of gold. The property was worked on tribute.

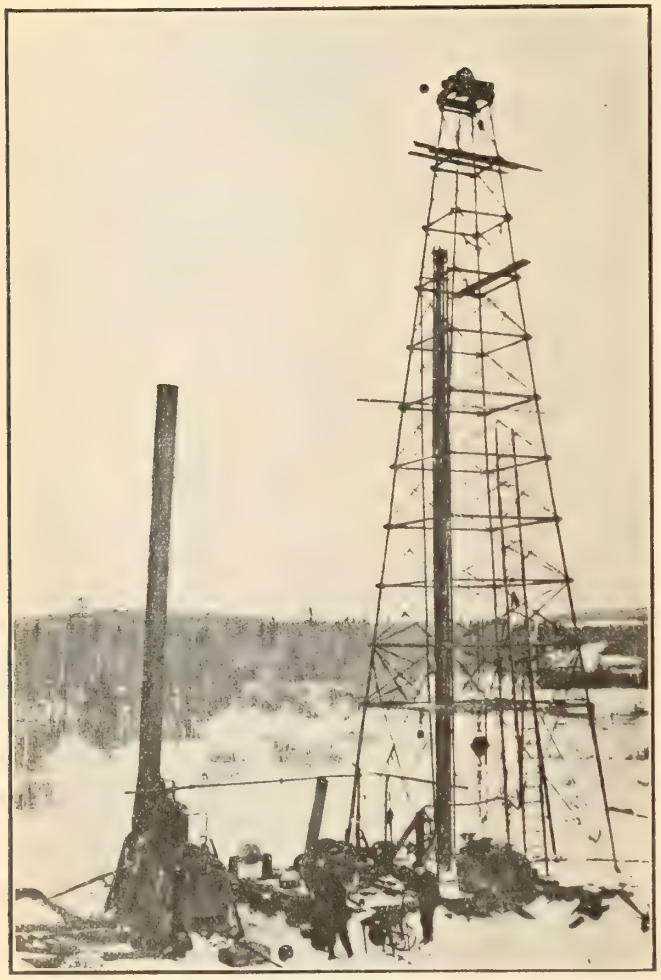
Micmac Gold Mining Company, Leipsigate. 2,583 tons of ore yielded 683 ounces 17 dwts. of gold and 116 ounces 8 dwts. of silver.

Hants County.— Dominion Antimony Company, West Gore. 3,042 tons of auriferous antimony were mined during the year. Of this 1,403 tons were shipped, most of which was No. 2 or "20 per cent." ore. The average amount paid to the company was $48.39 per ton. The ore contained 1319 ounces of gold, only part of which was paid for by the smelters. The purchasers were:—Hoyt Metal Company, Matherson & Company, Meallgesellschaft, Merton & Company, and the American Metal Company. The ore shipped contained from 17.58 per cent to 45.12 per cent. antimony and from 0.77 to 2.06 ounces of gold per ton.

Cameron Lead, 120 Feet Level, Ecum Secum.

Iron Ore.

The total amount of iron ore mined during the year was 48,337 tons, from the following districts: Torbrook 29,085 tons; Londonderry, including East mines,15,557 tons; Brookfield, 3,406; George's River, Cape Breton County, 289 tons.



Copper.

Colonial Copper Company, Cape D'Or. This company mined and concentrated 1971 tons of ore from which was produced 12,320 pounds of copper.

The copper smelter at Pictou was in operation but a few months. Newfoundland and New Brunswick ores principally were treated.

Cement.

The Sydney Cement Company manufactured 58,762 barrels of slag cement, which was marketed in Eastern Canada and Mexico.

Government Drill No. 6.
(Steam Calyx, 6 inch. Core capacity, 3000 feet.)

Gypsum.

Ten companies quarried and shipped gypsum to the total amount of 332,345 gross tons. This is a large increase over 1906 and is the largest amount ever shipped in one year. Practically the whole output was shipped to the United States.

Government Drills.

The government owns seven diamond and calyx drills-three steam calyx, one steam diamond, two hand diamond and one hand calyx. The drills are stored and repaired at Hantsport.

In 1907 a total of 6,273 feet of boring was performed at a cost of $3,247.31 to the department. This is a record in work done. The outlay of money also is lower considerably than in any previous year. The average cost per foot for all drilling done is creditably cheap, being about $1.50 per foot. Indeed in the past two years 9,112 feet have been bored at an average cost of $1.19 per foot. Only three holes were lost last year.

The total cost per foot for carbon wear with the diamond drills was 1.29 cents against 4.7 cents for shot for the calyx drills.

The total average cost per foot bored by the diamond drills was 0.73 and by the calyx drills $1.71.

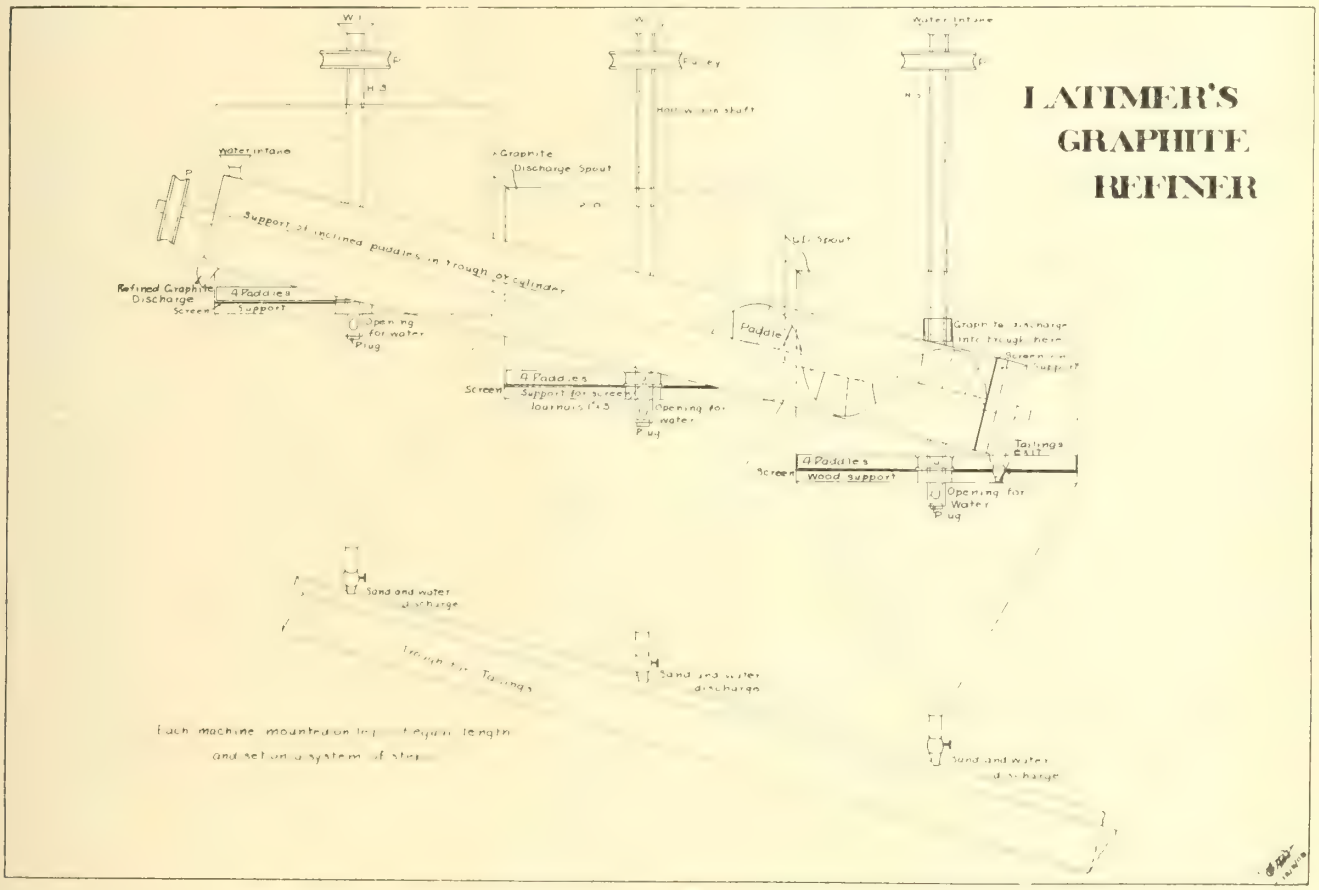
The fastest average rate of boring was 1.75 feet per hour with a steam diamond drill, sinking in sandstone.

WAGE SCALE AT COBALT.

From the March Labour Gazette the following Cobalt wage scale is taken:—

Carpenters	$3.50
Mechanics	3.50
Pipe lifters	3.00
Blacksmiths	3.50
Helpers	2.75
Engineers, nine hours	3.25
Over nine hour, 32 1-2 cents an hour	
Firemen, nine hours	2.75
Over nine hours, 27 1-2 cents an hour.	
Ore sorters	2.75
Hammermen	3.00
Teamsters	2.75
Hoistmen, nine hours	2.75
Over nine hours, 27 1-2 cents an hour	
Cage or bucketers	2.75
Other labour on the surface	2.50
Underground.	
Timbermen	$3.50
Machine men	3.50
Helpers	3.00
Cage or bucketers	2.75
Other underground labour	2.75

TREATMENT OF GRAPHITE.



Mr. J. F. Latimer, a well-known assayer of Toronto, has after a long series of experiments, succeeded in perfecting a process for refining graphite by which he claims to be able to extract in high grade condition from 75 to 90 per cent. of the graphite contained in the ore. The process and the apparatus for employing it are covered by patent.

The following is a brief description of the apparatus and its application. The apparatus employed consists of an upright cylinder or drum open at the top and funnel shaped at the bottom, with a water tap at the apex to permit of the discharge of tailings. A screen is placed across the drum just above the funnel-shaped bottom on a firm support. A hollow shaft through the centre of the drum passes down through the screen, and is boxed in the screen support. Adjustable paddles are fixed to the shaft just above the screen. The hollow shaft is revol-

ved by a pulley above the drum, carrying the paddles around longitudinally at such velocity as is found requisite.

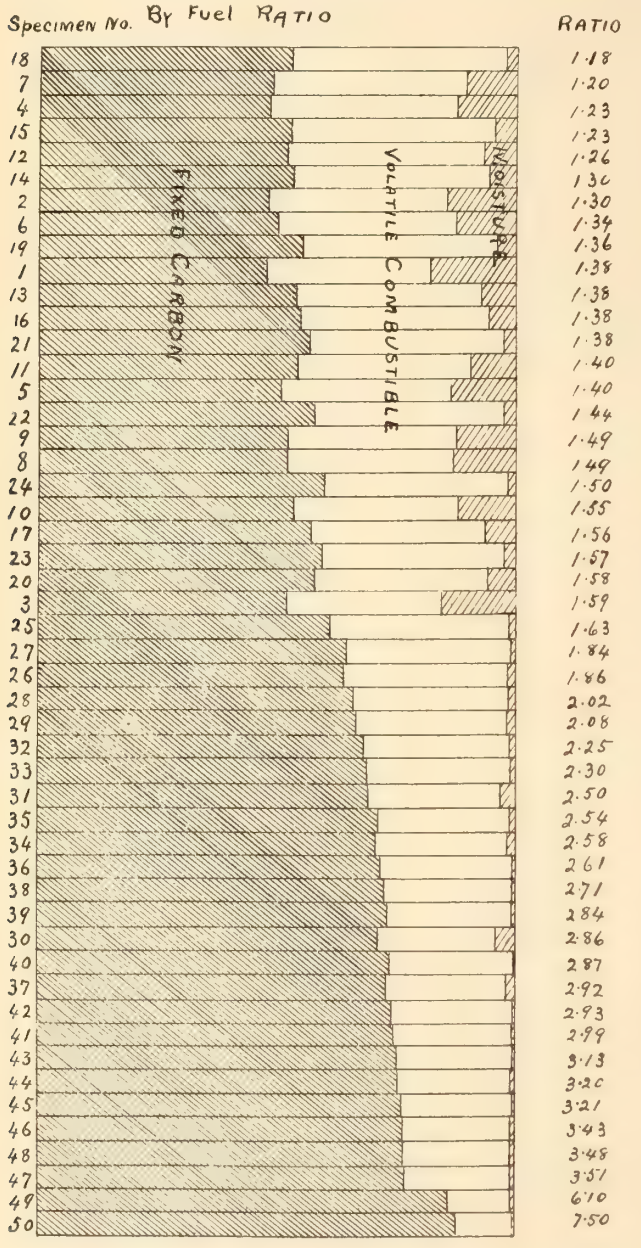
In operation, the pulverized ore is first mixed with a small proportion of crude oil, which causes the particles of graphite to cohere and so prevents them passing through the screen. Water is now allowed to flow down through the hollow shaft till it begins to flow up through the screen, then the prepared graphite is fed in near the centre of the drum. The sand or rock particles to which the oil does not adhere passes down through the screen, while the graphite is carried upward along the sides of the drum and up an inclined way and out through a spout near the top of the drum, automatically into a second or if desirable into a third drum, and thence, if deemed requisite, into an inclined trough, up which it is carried against a stream of water by a series of inclined paddles and discharged at the upper end not only free from sand but with all the dust washed away. The tap at the apex-shaped bottom being sufficiently opened to permit the tailings to escape, sufficient water is admitted through the hollow shaft to cause a suitable overflow at the top of the cylinder to carry over the graphite.

Calcic material treated in this manner was found after treatment to contain not a trace of lime.

Mr. Latimer states that arrangements are being made for utilizing some promising properties in Central Ontario by this process.

We wish this and all other inventions and enterprises undertaken for development of the natural resources of the country unqualified success.

Mr. W. H. Matthews of this city is associated with Mr. Latimer in handling this process.



CLASSIFICATION OF COALS BY THE SPLIT VOLATILE RATIO.

D. B. Dowling.
(Written for The Canadian Mining Journal).

Efforts to classify coals by the results obtained in proximate analyses only, have been mere approximations owing to the different methods pursued in the laboratories in the determinations of moisture and volatile combustible matter. Were uniform methods adopted it seems possible that a system of classification could be arrived at that would meet the needs of the general public. It is true that the ultimate analysis of a coal should be the proper basis for classification, and the carbon and hydrogen contents seem to be the principal items to be considered.

With the prospector and the general public supplied with an approximate analysis only, some scheme must be devised whereby they can judge of the proper grade of their coal without the added expense and loss of time in getting an ultimate analysis made.

With this end in view, as far back as 1877 Professor Persifer Fraser proposed for the coals of Pennsylvania that the fuel ratio be adopted—that is, the ratio obtained by dividing the fixed carbon by the volatile combustible matter. As these coals all contained a very small percentage of moisture, the fuel ratio served very satisfactorily as a means for grading them. When the western coals came to be examined it was found that the moisture content played a more prominent part and for these coals the fuel ratio did not serve as a true index. It was next proposed that for the poorer coals that the

moisture content be taken as an index, and all coals having over ten per cent. moisture be classed as lignites. This has been found to be unjust to many coals, such as those of Missouri, and some other scheme has to be devised.

In the paper under the heading Classification of Coals that the writer read before the March meeting of the Canadian Mining Institute in Ottawa, the proposal was made to use as a ratio for classification the following: Fixed carbon + ½ volatile combustible over Moisture + ½ volatile combustible. The analysis to be of an air dried coal.

To test the value of this ratio it was applied to the coals classified by the United States Geological Survey from the results of the St. Louis trials, using the ultimate analyses as a basis. The result gave a list which did not materially disarrange their position as given in the official scale, the greatest variation being in the centre or among the bituminous coal, the poorer grades following very closely the proper order and the position of the harder coals not being disturbed.

With the exception of cannel coals and coals altered by intrusions, such as those of the Telkwa River, B.C., it is hoped that the ratio proposed will serve for a working guide.

To illustrate the arrangement both by *fuel ratio* and *split volatile ratio* two diagrams have been prepared, in which a list of fifty coals are plotted, excluding the ash as not being a part of the fuel, on the same scale. The first diagram illustrates the order that would be given by arrangement according to fuel ratio, or the old Pennsylvania system. It will be seen at once that the better grades are arranged very nearly as they should be, but that for the poorer coals no one could agree that they were at all satisfactory.

In the second diagram they are again given in the order in which the split volatile ratio would place them, and in this it would seem that the better coals maintain their relative positions as in the old fuel ratio, and also that the low grade coals are in a more rational order.

A third diagram might be constructed to show the arrangement by either moisture or fixed carbon content, but it is evident that either one could not be used without considering the other and the arrangement would not be of much value.

Calorific Value.

The researches of Messrs. Parr and Hamilton, of the University of Illinois, published in Bulletin No. 17 of the University, have conclusively shown that there is a rapid deterioration in the coal from the moment it is brought from the mine, and unless the examination is made within a short time of the sampling the maximum results are not obtained. Exposure to the open air is proved to be generally far more destructive to the fuel value than if the coal is kept submerged. The loss in seven months from outdoor exposure varies from 2 to 10 per cent., so that samples from natural exposures can be no guide to the fuel value of the coal. The list of coals discussed in these notes are, in the majority of cases, from the outcrops and therefore to test the scheme of classification by referring to the calorific determination it would be necessary to have also a uniform method of sampling which would exclude all weathered coal. To show that these coals are weathered and some even kept for an undue time before examination, it is only necessary to refer to diagram No. 3, in which the calorific value for pure coal in B.T.U. is plotted to go opposite diagram No. 2. As it is impossible to get a maximum line for this series an approximate one is plotted from a similar series in the St. Louis experiments, which are as near fresh mined coal as we are apt to get. The specimens which give results approaching this maximum are from mines marked with an X and a few others, which are evidently samples taken by digging into the seam to beyond the badly weathered portions.

No. 30, the one which shows the poorest result or the greatest deterioration, is a sample collected by the writer from a seam that was discovered when he did not have a shovel, and the surface was scratched over by a ham-

mer. The coal was weathered to dust and the samples were handsfulls tied up in a handkerchief.

No. 46, from Fernie mines, was very high in ash, and it is just possible that the sample burned in the calorimeter did not have as high an ash content as the portion assayed, so that the slight change in per cent. (the coal had about 15 per cent. ash) would easily disturb the result.

The diagram will show the necessity of obtaining fresh samples and having them analyzed shortly after collection.

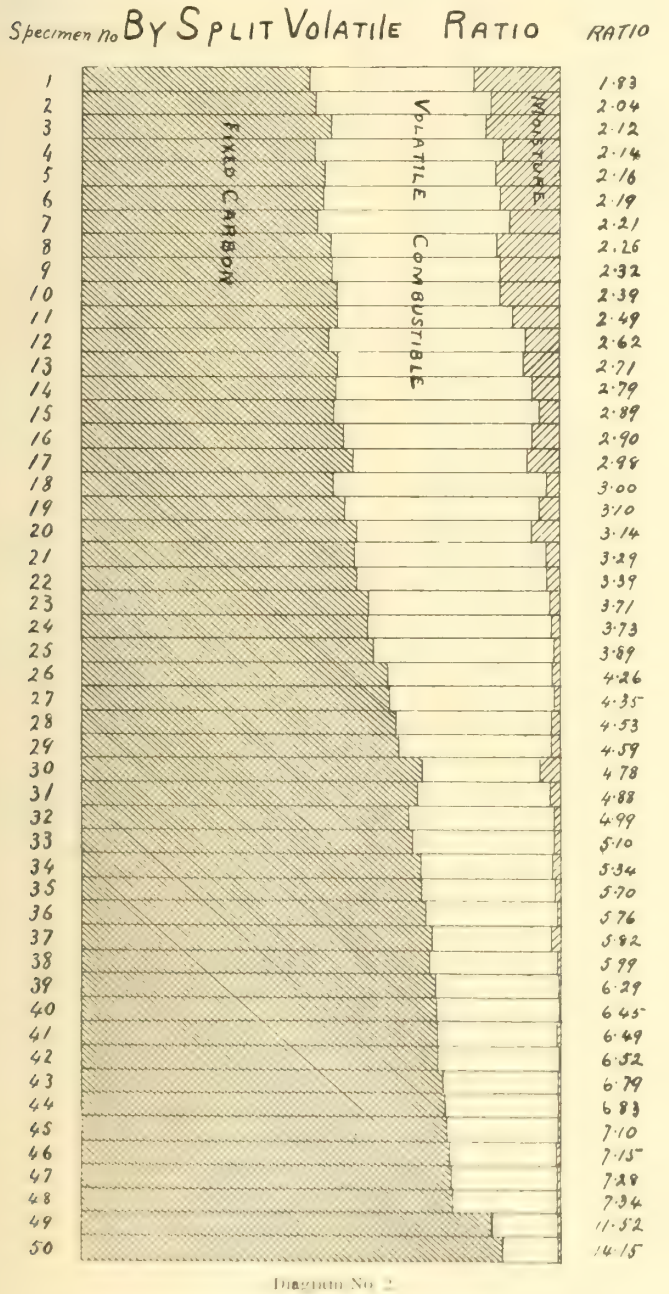


Diagram No. 2.

It also gives us a clue to another line of enquiry that would be profitable. It has been shown that from the maximum the deterioration is rapid at first, but pursuing this to trace the curve for the deterioration for subsequent time means a long wait. Could we not start at the weathered coal and trace it back into the seam until we arrive at the maximum and so determine the depths to which coal is subject to this loss from the air exposure, as well as finding at the same time the maximum loss to which each coal is liable?

If it were not for this trouble with weathered specimens, it seems to the writer that the scale of classification could be so plotted that the coal could be put in its proper place and an idea of its fuel value given, as is suggested in diagram No. 3.

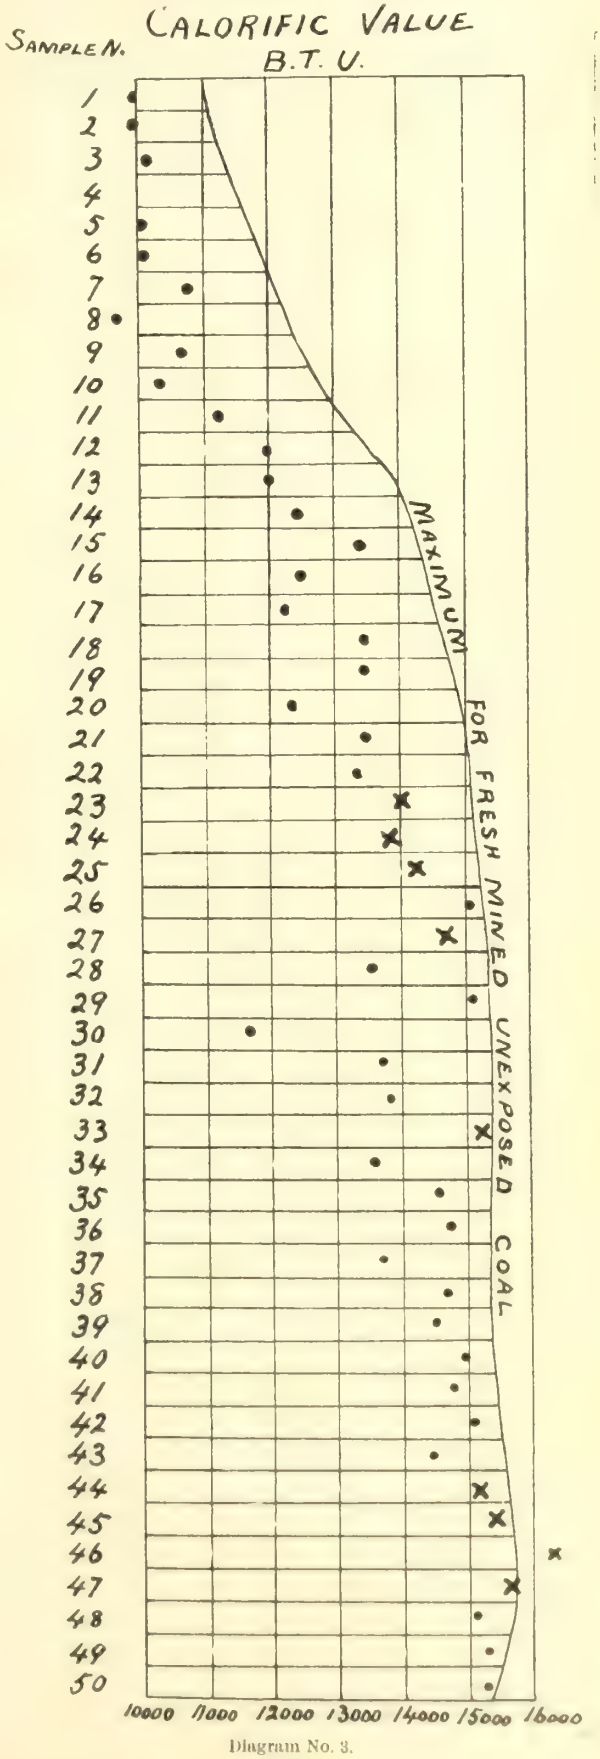

Diagram No. 3.

Note.—As several of these analyses are over 20 years old and the samples are still to be found, it would be interesting to repeat the analyses as nearly under the same conditions as to apparatus and moisture content as at first, and find the effect of air exposure for a period of upward of 20 years in some cases.

The list of coals used for the diagrams are from the following localities:—

No. 1. South Saskatchewan, 10 miles above Medicine Hat.
No. 2. Red Deer River, 7 miles above Hunters' Hill.
No. 3. North Saskatchewan River. Big seam at Goose Encampment.
No. 4. North side of Milk River Ridge, thin seam.
No. 5. Red Deer River, near mouth of Rosebud River.
No. 6. Bow River, seam 4 feet 6 inches on Grassy Island.
No. 7. Prairie Creek, Athabaska River. Coal Creek branch.
No. 8. Edmonton, seam 6 feet, in banks of river.
No. 9. Athabaska River, near mouth of McLeod River.
No. 10. Bow River, near Blackfoot Crossing.
No. 11. Belly River, 5 miles below Little Belly River.
No. 12. Belly River, main seam at Coal Banks.
No. 13. St. Mary River, 7 miles from Bow River.
No. 14. Prairie Creek, Athabaska River, near Forks.
No. 15. Belly River, near south end of Blood Reserve.
No. 16. Bow River, Coal Creek, west of Cochrane.
No. 17. Highwood River, north fork.
No. 18. Near Lundbreck, lower seam on Crow's Nest River.
No. 19. Near Lundbreck, upper seam on Crow's Nest River.
No. 20. Pincher Creek seam at Government Indian Farm.
No. 21. Wellington Mine, Nanaimo, Vancouver Island.
No. 22. Pine River, 5 miles above Lower Forks.
No. 23. No. 5 Southfield Mine, Nanaimo, Vancouver Island.
No. 24. Harewood Mine, Nanaimo, Vancouver Island.
No. 25. Extension Collieries tunnel vein, Nanaimo.
No. 26. Marlen Creek, B.C., Peter seam.
No. 27. Union Mine, Comox, Vancouver Island.
No. 28. Mill Creek, Alberta, 4 miles above mill.
No. 29. Marten Creek, B.C., Jubilee Seam.
No. 30. South Branch Brazeau River, seam No. 6.
No. 31. South Branch Brazeau River, seam No. 5.
No. 32. South Branch Brazeau River, the Big Seam.
No. 33. Union Colliery, Comox, B.C., Pit No. 5.
No. 34. South Branch Brazeau River, Kidd seam.
No. 35. South Branch Brazeau River, seam No. 2.
No. 36. Saskatchewan River, opposite Bighorn Range, seam No. 3.
No. 37. North Fork Old Man R. or Livingstone River, near gap.
No. 38. South Branch Brazeau River, seam No. 1.
No. 39. Bighorn River, seam No. 2, branch of North Saskatchewan.
No. 40. Saskatchewan River, opposite Bighorn Range, seam No. 4.
No. 41. South Branch Brazeau River, seam No. 4.
No. 42. South Branch Brazeau River, seam No. 8.
No. 43. Bighorn River, seam No. 3.
No. 44. Morrissey, B.C., 18 ft. seam.
No. 45. Coal Creek, B.C., 6 and 8 ft. seam.
No. 46. Coal Creek, B.C., 9 ft. seam.
No. 47. Michel, B.C., No. 3 mine—highest seam worked.
No. 48. Coal Creek, B.C., mine No. 3.
No. 49. Morrissey, B.C., 18 ft. seam.
No. 50. Cascade River, exposure between Bankhead and Anthracite.

REMARKS ON SOME RECENT EXPLOSIONS IN COAL MINES.

(Address of President C. J. Coll, Mining Society of Nova Scotia, 25th March, 1908.)

It is not my purpose to go into this subject except as briefly as possible. The causes and effects would furnish material for innumerable papers. We are all, however, interested as to ways and means for the prevention of loss of life and for the protection of property. I shall therefore confine myself to some remarks which in my opinion will make for a lessening of mine explosions.

It would be absurd to contend that any rules or regulations could be framed to absolutely prevent mine accidents. It is an old and trite saying that so long as there are mines there will be mine accidents—so much depends on labor, and, indeed, too often the same applies to officials. Lack of knowledge of the most fundamental principles pertaining to safety, wilful neglect of rules and instructions tend toward increasing the hazards of mining.

The appalling explosions that have occurred in the bituminous mines of Alabama, West Virginia and Pennsylvania, where about seven hundred lives were lost, have started vigorous discussions by technical and trade papers, as well as the press generally, state and mine officials, operators and employees, as to the best means for the prevention, as far as possible, of a recurrence of such disasters. Many suggestions have been made, covering enactments of more stringent laws, closer inspection under such enactments as are now in force, and a healtier cooperation on the part of mine owners as regards discipline and the carrying out of mines' regulations.

It would seem that many of our laws relating to mines and mining are cumbersome, and admit of varied interpretations. All such laws should be as simple as possible, inasmuch as many officials who have intimately to deal with questions arising as to interpretations in connection with the carrying out of mine laws are not familiar with legal phraseology, and err at time through a misconception of what is intended, and not by wilful neglect of certain provisions.

It has been suggested in the United States that a general law be enacted by the Federal Government for the protection of life and property throughout the entire country. There has also been some such measure proposed for Canada. I do not think such laws would be as effective as state or provincial regulations. It is beyond contravention that conditions in coal mining are of such a varied character that it would be practically impossible to frame legislation to meet them. The re-

sponsibility for the enforcement of any such general law rests with local authorities, and depends almost entirely on reports of inspectors familiar with conditions in their respective districts. Such being the case, the details of inspection and enforcement of legislation should remain in control of state and provincial governments. In order to carry this out effectively all laws connected with mining should emanate from states and provinces.

No matter how rigid legislation may be, in order to obtain results aimed at, inspection and enforcement should be in keeping. No evasions should be permitted, except so far as they are at times necessary in order to improve dangerous conditions. The laws should apply alike to each and every mine. Operators anxious and willing to not only meet rigid requirements but to go beyond them in an endeavor to reduce to a minimum causes of accidents should not be made the willing horse to bear the burden of unreasonable demands on the part of constituted authorities, while at the same time competitive mines, from a market standpoint, are permitted to carry on operations in a slipshod and careless manner. I am glad to say the Mines' Regulation Act of Nova Scotia is an admirable one, and affords ample means for the correction of dangerous practices where they arise. Much, no doubt, is left to the discretion of the officers whose duties are to see that its provisions are properly carried out; but with strict, conscientious, discriminating officials, little trouble need be experienced. Added to this, however, workmen and operators should at all times give their hearty co-operation. Let us briefly consider some of the causes of the recent explosions which have occurred.

Yolande-Alabama.

To sum up a report made for the Governor of the State, two members of a commission were of the opinion that gas was ignited by an open light, and on account of the dry, dusty condition of the mine the flame was extended to the other workings. The other member of the commission was of the opinion that a charge of dynamite which a miner was handling exploded, and this, in connection with coal dust, caused the explosion. We may conclude that open lights, coal dust, non-flameless powder and probably firedamp caused the explosion.

Monongah-West Virginia.

The investigation into the causes of this calamity were very thorough and probably received more attention than any which have occurred on this continent. From all evidence adduced and from the reports published the ventilation of this mine was very good. On the other hand, it is known that firedamp was generated, whether in negligible quantities or not there seems to be some question. Gas, however, was reported the morning of the explosion. The mine was very dry and dusty; black powder was used as an explosive; electric chain undercutting machines were in use, and this type of machine grinds the cuttings into extremely fine dust, and by reason of their low cut require a much larger charge of powder to blow down the coal. There was also evidence that fast shooting, at least to some extent, had been in practice. There seems to be some divergence of opinion as to the cause, being variously ascribed to open lights, which were in use throughout the mine, igniting firedamp; a blown-out shot flaming into an explosive mixture of dust; short circuiting of electric wires, and a runaway trip raising an unusual volume of dust, which was in turn ignited by an open light. Here again we have the same elements as at Yolande—dry, dusty mine, with at least some firedamp, in which open lights, non-flameless powder and electricity in addition were in use.

Naomi-Pennsylvania.

It would practically be reiteration of what has been said as regards Monogah to state the probable causes of this disaster, with two exceptions—this mine was more gaseous and ventilation was not deemed adequate.

Darr.

This, the greatest mine disaster in the history of coal mining in the State of Pennsylvania, following closely that at Monongah, was also a matter of much investigation. The report of a special commission appointed by the Chief of the Department of Mines of Pennsylvania is to the effect that this was a gaseous mine. The system of ventilation and electric undercutting chain machines were condemned. These machines undercut to a depth of six feet, with a height of cut of about four inches. This mine was partly very dusty and partly damp. Open lights and black powder were used throughout.

To sum up for all these explosions, we have, for our consideration, two or more of the following dangerous elements—open lights, electric mining machines, explosives, coal dust and firedamp. Let us take these in the order in which they have been named, and treat them briefly in the relations they bear to each other, and from the standpoint of mine owners or managers desirous of protecting life regardless of cost and preventing loss of property, which is coincident with and invariably a resultant of a mine disaster. Not the least of the troubles which follow is absolute disorganization of operating force, through fear of a recurrence or superstition, whereby output is so affected that even if the mine has not sustained serious damage (which is not often the case) it is difficult to bring the mine up to a profitable basis for some time.

Open Lights.

While a strong advocate of locked safety lamps, I would not go so far as to say that there are not mines where open lights may be used without danger. Where a condition exists such as a seam of coal having a light uniform cover, where breaks readily and quickly reach the surface, and little dust and no gas are to be found, I would not hesitate to use open lights. On the other hand, where coal is blown by any explosive, I would certainly use safety lamps.

Again, it would be folly to have safety lamps and use a non-flameless powder. Where firedamp is being generated in a coal seam or is likely to come from overlying or underlying strata, no open lights should be permitted. In the case of firedamp existing in porous overlying strata, it usually follows that where a fall takes place in drawing pillars or in longwall work firedamp will follow the fall. If open lights are in use there is every likelihood of contact with workmen's lights, at or near the face of the workings—indeed I have seen large sections of mines fouled in this way many times. It is my opinion that only under the most favorable circumstances (rarely to be met with in coal mines) should open lights be used, and under no conditions should open and closed lights be used in the same mine. While on the subject, I may be pardoned if I digress to say that many of the objections raised by workmen against safety lamps are not warranted. It has been said that accidents from falls of roof and coal are less with open lights. This I do not admit, inasmuch as dangers of the sort are rarely visible to the eye. The ordinary practice (one of the first

things a man learns in a mine) is to test for such dangers by sounding. To do this, light is of no avail. As regards light required for actual mining, approved modern safety lamps furnish ample for all practical purposes. As a matter of fact, the only persons whose amount of work accomplished is cut down are shift men, who are not on a contract basis: so that to my mind the only sufferers by reason of curtailment of returns is the operator. From a sanitary standpoint there is no comparison.

Electric Mining Machinery.

Generally speaking, I would not use electricity in any dusty, gaseous mine for any purpose, except as introduced at a low voltage, and then only when confined to intake currents. I do not think it safe practice to use electric machines at a working face except under the most favorable conditions—no gas and wet coal—nor would I consider the use of motors on main haulage roads under above conditions, except in an intake current and where saturation of dust was complete—bottom, sides and roof. The machines of the chain undercutting type have been strongly condemned in various reports made on the accidents subject of these remarks. What the outcome of certain recommendations will be is matter of interest.

Explosives.

Probably no question in connection with coal mining in recent years has attracted more or wider spread attention than this—both before and after the explosions under discussion. More especially is this true in Great Britain and on the continent, where many commissions have been appointed to make careful examinations of powders for coal mines. As a result of such commissions, legislation has been enacted whereby only such powders may be used as have passed the most rigid tests and come under the head of permitted explosives, and named for specific conditions and purposes. It is within the scope of this paper to touch but briefly on this subject. It is not claimed by the manufacturers of so-called flameless powders, nor if so claimed would it be admitted by practical mining men, that under any and all conditions such powders are "safe." The question that confronts us is that for economic reasons we are obliged to use some explosive to blow down coal. This being the case, what explosive shall be used? Certainly not those which on every hand (from past experience) have been condemned. I would therefore not consider the use of any other than a so-called flameless powder. Even with this there are dangers well known to the officials and workmen who are in daily contact with its use. It is needless to say that it should never be fired in the presence of gas, nor should it be used for fast shooting, especially in a dry, dusty mine. It is a well known fact that a shot well placed and exerting its maximum amount of energy in material won is least dangerous: hence the danger of blown-out shots.

Again, it is well known that even the best of the flameless powders will not explode, but burn in the hole. Taking into consideration the proportion of coal which may only be won economically by shooting, it remains for the mine manager of to-day to use the explosive least liable to cause such disasters as have taken place within the past five months, as I am of the opinion that nearly all of them were directly due to the use of so-called non-flameless explosives in the presence of other elements of danger. The essentials of shooting to reduce as far as possible every chance for disastrous results are comprised within certain precautions:—

First—The working face to be shot should be properly mined and sheared (if a close cut) to permit of the greatest effective energy of the charge being consumed in the breaking down of the coal.

Second—Holes should be so drilled as to bring maximum results from a minimum charge. This is a matter of education, as it will usually be found that there are miners or officials who make a close study of this question. Returns will show day in and day out that certain men will put out more coal per given quantity of powder than others. Their method of holing and charging should be the basis for like conditions.

Third—No fast shooting should be allowed under any circumstances or condition. I feel sure this position is subject to attack both by operators and workmen. A detailed defence of this declaration would of necessity be a paper in itself. I will therefore confine myself to a simple assertion that there are more dangers connected with fast shooting due to the possibility of blown-out shots than with all other troubles combined incident to the use of explosives. This has been recognized in some districts, and is a matter of legal regulation.

I offer for your consideration the rules governing shooting which have recently been put into practice in the mines of the Acadia Coal Company:—

1. When a miner holding a shot firer's certificate is given permission to fire his own shots, before firing he must carefully examine the place where the shot is to be fired, and if he discovers any noxious gases, defects in the roof, or danger from any other source, no shots must be fired until such danger is removed.

2. No shot must be fired until the face is either sheared, mined or undercut, not less than three feet deep, the full size of the place, or having an open end equal to the same, without special permission.

3. No shot must be fired, when the borehole used for firing extends beyond such mining, shearing, undercutting or open end. All holes found beyond such mining, shearing or open end will be termed fast shots.

4. No shot must be fired with the timbering at a greater distance from the working face than eight feet, or closer if required by the management, or by a special permit that timbering may be a greater distance from the working face.

5. He must return immediately to each shot after it fires, and if he should find that the shot has lighted a blower of gas, liberated a quantity of gas or disturbed the roof or timber and caused danger beyond his control, to either extinguish, repair or make safe, he shall immediately notify some official at the time in charge of the mine or district in which he is working.

6. When a "bench" shot has been fired ,the miner must immediately proceed to turn over the coal or load it out.

7. If the shot fails to go off, no person shall be permitted to enter to the working face, until such time as he receives permission from and is accompanied by the examiner of that section.

8. No holes shall be charged for a longer period than 30 minutes before being fired.

9. If, owing to an insufficient charge of powder, a face shall be "hung up," all the coal to the depth of that shot must be mined out by hand pick or machine, unless permission is given by the examiner of that section to drill and fire another shot.

10. No miner or shot firer shall leave any charged hole in his working face, when quitting work for the day.

11. No person shall drill any hole in such manner that when fired it will be liable to shoot into either roof or bottom of the coal seam.

12. If a miner, at any time before or after firing a shot finds that any timber requires to be set or replaced, he must not leave the place until such requirements are duly executed.

13. He shall also set sufficient holing props when required to do so, and to work his place in a safe and proper manner.

14. In firing shots with a battery, the wires shall be first connected to the fuse wire, and the connection to the battery shall be made only by the person who has made the connection to the fuse wire.

15. Every precaution must be taken to ensure each person being in a safe place before any shot shall be connected up to a battery.

16. No battery shall be tested or tried at any point outside of the lamp station.

17. No batteries shall be permitted to be used by any other than one holding shot firer's papers.

18. No person shall be permitted to fire shots without permission from the examiner or official in charge of the mine.

By special order another rule has since been put into effect, namely, that all holes must be stemmed with clay. It will be noted no mention is made of stemming bars or needles, as the Mines' Regulation Act of Nova Scotia provides that none other than copper tipped or wood be used.

No person other than a regularly appointed official shot firer should be permitted to fire a shot. It should be his duty to examine every place before shooting, and also to see that holes are properly placed and drilled, and to make a study of the amount of charge required under any condition which may arise. It should also be his duty to instruct unskilled labor in their duties and warn them of dangerous conditions.

There are two bugaboos facing operators in changes (so far as operators are concerned in their relation to labor), namely, from open to closed lights and in explosives. The antagonism to such changes on the part of workmen is largely one of sentiment. I do not hesitate to say that when better and safer means are adopted for the preservation of life and protection of property, and when workmen become familiar with such means, they would object as strenuously if the old customs and practices were restored.

Coal Dust.

This menace to all coal mining has probably been the cause of more heated discussion for and against its explosiveness than any condition connected with mining. From the days of Faraday and Lyell until the present time this question has been a matter of dispute. That it will augment the force of an explosion of firedamp from any cause is, however, recognized by practically all mining men. It is also generally admitted that so-called negligible percentages of gas and coal dust may, under certain conditions and mixtures, become explosive as a mixture. The careful mining man should not be led into splitting hairs in any matter wherein there is the barest possibility of danger. Such questions had best be left for discussion to persons whose interests are not of a financial nature in mines or mining. Fewer accidents will happen if the gun is always treated as being loaded.

The theories advanced that in itself (coal dust) more danger is to be apprehended in winter than in summer, in intake airways than in returns, in high air velocities than in low should receive no consideration from mine managers whose duty it is to keep a mine up to its highest effective point, which precludes the possibility of accident, where accepted measures of practice, if employed, would avert them. The only known effective and practical solution of overcoming the difficulty of dust is humidity.

The simplest and no doubt the best plan is by sprinkling. Obviously the more nearly this approaches saturation the better. At this juncture, I wish to lay particular stress on thoroughly wetting floor, sides and roof. Especially is this necesary in main haulage-ways used as an intake, for the reason that explosive forces invariably travel against the current of fresh air, and it is also true that such explosive forces have spent or been greatly reduced when such an airway or district has been reached when coming from inbye, the usual source of an explosion. It has been suggested that a small proportion of lime added to water will reduce the combustibility of dust materially. Humidity may also be greatly increased by means of sprays in the intakes. This is readily accomplished in deep mines where a head of water may be obtained from discharge columns. From there, small lines may be run to intakes. By small perforations in coils air may be thoroughly saturated. While much of the moisture would no doubt be precipitated within a short distance, enough would remain in suspension to overcome the difference in humidity as between summer and winter. In other words, it would be uniform the year round.

Firedamp.

Little need be said about this, for, like the poor and taxes, we have it with us always. Well regulated and distributed ventilation is the only remedy. Constant vigilance, frequent inspection and rigid discipline are absolutely necessary in order to prevent accidents. In my opinion the barometer should be carefully considered as a means of warning. Treated as such, it will induce extra precautions and watchfulness during periods of atmospheric disturbance. It may be of interest to the members to know that it was remarked by the officials of the Acadia Coal Company that during the latter part of the year 1907 there were frequent and violent fluctuations of the barometer recorded. It was during this time the explosions under discussion occurred.

In conclusion, I would recommend as follows:—

First—Frame simple, effective, stringent laws to cover local conditions.

Second—Operators obey the laws. When it is known that no evasions on their part are countenanced or contemplated, workmen will be more amenable to discipline.

Third—Court the closest inspection under the laws and take suggestions even beyond the laws which make for the betterment of conditions.

Fourth—Exercise strict discipline with workmen, and educate ignorant or unskilled labor to meet dangerous conditions.

Fifth—Use none other than approved safety lamps where firedamp or dust are likely to occur.

Sixth—Abolish electric mining machines in dry, gaseous mines.

Seventh—Prohibit the use of all explosives except non-flameless ones.

Eighth—Permit no fast shooting.

Ninth—Prohibit the use of coal dust for tamping.

Tenth—Supervision as to placing of holes and amount of charge.

Eleventh—Employ regularly appointed competent shot firers to fire all shots.

Twelfth—Allay coal dust as much as possible by sprinkling or other means.

Thirteenth—Remove all coal dust after machines before firing shots.

Fourteenth.—Have adequate ventilation and regulate to meet conditions.

Fifteenth—Employ competent, conscientious officials, and see that all parts of the mine are visited at frequent itnervals.

If such regulations had been carried out in the spirit as well as to the letter, the appalling calamities which have been the subject of this paper would not have occurred.

BOOK REVIEWS.

THE COPPER HANBOOK—A MANUAL OF THE COPPER INDUSTRY OF THE WORLD. VOLUME VII. COMPILED AND PUBLISHED BY HORACE J. STEVENS, HOUGHTON, MICH. U. S. A.

Volume VII, of the new edition of the Copper Handbook, has just been issued by the author, Horace J. Stevens, of Houghton, Michigan.. The book has 1228 pages, octavo, brevier type, being materially larger than before. The author apologizes for his inability to revise the book throughout, explaining the fire, sickness and loss of five months time prevented. However the new volume contains about 180,000 words of new matter, equal in length to three ordinary works of fiction, in addition to the matter remaining unchanged from the preceding issue.

The new edition of the Copper Handbook contains 25 chapters, an increase of nine, treating of copper under the headings of history, geology, chemistry, mineralogy, mining, milling, concentrating, hydrometallurgy, pyrometallurgy, electrometallurgy, alloys, brands, grades uses, substitutes, terminology, geography, copper deposits, copper mines and statistics. The treatment given the subject in 1228 pages is encyclopaedic in scope, but the logical and orderly arrangement of the great mass of facts presented, coupled with a table of contents, full index and alphabetical arrangement of districts, countries, mines, minerals and glossary, renders it possible to ascertain any given fact with almost as much ease as a word is found in the dictionary. This is a point of much value to readers that has been overlooked in many otherwise excellent works of reference.

The Copper Handbook is not intended to replace other works for the use of technical men, but it does supplement all other technical books on copper, while for the average reader its hundreds of pages devoted to the scientific and technical features of the subject will be found to cover every point of interest. The language is plain throughout, and the layman, whether miner or investor, will find the clear and easily understandable exposition of scientific facts a great aid, as the highly technical language used in many of the best scientific works is a serious stumbling block in the path of the man not technically trained.

In whatever light the Copper Handbook is viewed, whether in describing the thousands of different copper mines, in all parts of the world, in the plain descriptions of intricate processes of mining, milling, smelting and refining, or in the forty pages of statistics covering the copper industry of the globe in its various commercial and financial aspects, the book must stand as a monument of patience and labour, since it is the unaided work of a single man.

The descriptions of the mines are written without fear or favor, and several hundred mining companies, some very prominent, are handled without gloves, and in a manner that would justify no end of libel suits were the author not sure of the facts. In view of the exceedingly plain speaking in this book, in which scores of companies are termed swindles and frauds, it seems rather surprising that in the seven years of its publication not one libel suit has been brought into court, though many have been threatened. In fact the author of the Copper Handbook has turned the tables on some of his critics by placing a few of them in prison, for their frauds upon the investing public.

The price of the Copper Handbook is five dollars, and the selling plan used is absolutely unique in the book trade. For five years past Mr. Stevens has sent his book, all carriage charges prepaid, without a penny payment in advance, to any person in any part of the world, on one week's approval, subject to return if unsatisfactory. It speaks well for the book that only about one copy in thirty has been returned, and well for the honesty of average human nature that only about one man in thirty keeping the book has failed to pay for it. On these unusual terms anyone interested in copper can well afford to send to Mr. Stevens for a copy of the new edition of the Copper Handbook.

SIMPLE MINE ACCOUNTING—BY DAVID WALLACE, EXPERT MINE ACCOUNTANT. HILL PUBLISHING COMPANY, 505 PEARL STREET, NEW YORK. 9 1-2 x 6. PP. 63. PRICE, $1.

There are very few subjects upon which a hand-book is so badly needed as on mine accounting. As a branch of bookkeeping it receives little attention in the ordinary business college. So true is this that almost invariably the mine accountant is forced to invent a system of his own after he has gone through the inevitable period of mistakes and waste.

It will therefore be conceded that the book before us is timely. It is intended primarily for those who have had no opportunity to study bookkeeping. It is also intended to be of use to mine accountants and bookkeepers. These aims are praiseworthy.

We believe, however, that the book will be of more assistance to the trained bookkeeper than to the superintendents, mine foremen, and others for whose benefit it was largely designed. It is doubtful if an inexperienced man could follow the somewhat intricate methods presented by Mr. Wallace.

All the forms given are good, although Form No. 20 page 50, is complicated and not particularly necessary. Incidently the phrase "Waste" is used without explanation. In Form 15, bracketted figures are used to indicate the distribution of items to accounts. The explanation of these figures is not given until the next chapter.

A series of footnotes would have made the forms more easily intelligible.

These are, after all, incidental faults. It is probable that there will be a large demand for the book. Experience will show exactly in what respects it needs alteration.

CANADA'S FERTILE NORTHLAND—EDITED BY CAPTAIN ERNEST J. CHAMBERS, GENTLEMAN USHER OF THE BLACK ROD. PUBLISHED UNDER DIRECTION OF R. E. YOUNG, D. L. S., SUPERINTENDENT OF RAILWAY LANDS, DEPARTMENT INTERIOR. GOVERNMENT PRINTING BUREAU, OTTAWA, 1907.

The evidence heard before a select committee of the Senate of Canada during the Parliamentary Session of 1906-7 is here condensed and collected.

The report deals with the mineral, agricultural, timber and fishery resources of those parts of the new provinces of Saskatchewan and Alberta that lie north of the Saskatchewan watershed, of Ungava, of Keewatin, and of Mackenzie, which lies north of Saskatchewan and Alberta.. The total area of these districts is 1,637,559 square miles or more by 300,000 square miles than twice the combined area of the four original provinces of Confederation.

Dr. A. P. Low, Mr. R. G. McConnell, Mr. J. B. Tyrrell and Mr. D. B. Dowling are among those who gave evidence upon mineral possibilities and transportation in the region west of Hudson Bay.

The navigability of Hudson Bay is touched upon and valuable meteorological tables are included.

The pamphlet is timely, especially in view of present and proposed railway extension.

EXCHANGES.

The Mining World, March 21, 1908—The system of government inspection of mining claims in Ontario is the subject of a short paper in this number of the Mining World. Mr. J. B. Tyrrell of Toronto is the author. He gives an illustration from real life of the practical working of Ontario mining law.

Last summer Mr. Tyrrell was professionally engaged by a prospecting syndicate to inspect claims staked out in the vicinity of Montreal river. He had, of course, no interest whatever in the properties, but inadventently some of the claims were, by power of attorney, staked in his name. Two claims, A and B, were staked and worked alternately by a small gang of men. Word was received that claim A would be inspected on August 1st. The foreman waited for two or three days, but the inspector did not appear. The foreman was then called to a distant claim and in his absence the government inspector arrived. About a month after this, word was received that the claim was thrown open and notice to that effect was posted in the recording office. Those visiting the office had, naturally, the first information and a rush was made to restake the claim,

It was first restaked by J.— at some distance from the original discovery. A government inspector immediately passed the discovery and J.— was given the claim.

Later in the summer claim B passed inspection in favour of the syndicate on a native silver discovery.

Mr. Tyrrell concludes by stating that it would be difficult to conceive any plan more effectively discouraging to investors than this arbitrary criticism by government officials. He suggests that the government should be entirely grateful to any man who is putting his money into the development of mining claims.

The *Engineering Magazine*, April, 1908—The leading article in this number is "Rescue Appliances in the Mines of France." The author, M. Jacques Boyer, is a French consulting mining engineer.

After the Courrieres catastrophe a commission of four selected engineers was appointed to enquire into the merits of respiratory apparatus. The commission report led to the issuance of a decree (April 15, 1907.) directing that mining in France should provide, for all workings when more than 100 men are employed, "portable respiratory apparatus ready for immediate use and permitting the wearer to remain at least one hour in an irrespirable atmosphere." This and other requirements were to be fulfilled within one year of the date of the decree.

Rescue appliances date back to 1785, according to an official memorandum issued in 1824 by the French Government, describing three types of apparatus and requesting mining companies to procure a number for rescue work. The first apparatus described was a French invention and consisted of a nose clip, a mouth piece, and a respiratory tube for free air. To it were subsequently added an anti-memphitic respirator with two valves, and a lamp supplied with air through a branch of the respiratory tube. The second apparatus included air reservoirs carried in a rescue car. To the reservoirs respiratory tubes were attached. The use of compressed air was suggested. The other suggestion was the use of respiratory tubes supplied by blowers and suitable piping.

This memorandum was disregarded and it was not until 1864 that progress was marked by the appearance of the Galibert respirator, a reservoir of pure air carried upon the miner's back, a respiratory tube from the bottom and an exhalatory tube from the top, both connected with the mouth. The ivory mouth-piece had two orifices and by closing these alternatively with the tongue he inhaled air from the bottom and exhaled it from the top. A man could use this apparatus for fifteen or twenty minutes, but the air became greatly vitiated. Later, Galibert attached a device for absorbing the carbonic acid gas and partly regenerating the air.

Rouquairol-Dinayronze in 1870 brought out his *aerophore*, consisting of a large sheet-steel tank containing air compressed to 20 atmospheres. A pressure regulator was attached and the nostrils of the user were closed by the pince-nez.

In 1884, Dr. Regnard applied the principle of revivification of the air by means of a reservoir of oxygen and of the passage of the exhaled air into another receptable filled with pumice-stone saturated with a solution of caustic potash.

Up until 1880 no apparatus was devised that could pass satisfactory practical tests. But in 1903 Lieutenant Vanginot of the Paris Fire Department invented, and in 1907 improved, a respirator that has been used in many places with success.

The two types of rescue apparatus in use in French mines are:—

1. Portable appliances which permit the bearers to move at will.

2. Apparatus with pumps and piping, having a limited range of action and adapted rather for work than for rescue.

The portable appliances may be divided into two classes: First, regenerative apparatus, and, second, apparatus using ordinary air.

In the former class may be noted the ancient *pneumatophores* (used more commonly in Germany and Austria than in France), which consist of oxygen tanks, usually without any regulator, delivering into an air-tight bag from which the man inhales and into which he exhales. An absorbent in the reservoir purifies the exhaled air by the removal of the carbonic acid gas. This type has been abandoned as has also the Shamrock.

The Draeger-Guglielminette respirator is complicated and its parts are fragile. It comprises an oxygen reservoir, a pressure reducing regulator, a respiratory mask, and a regenerator. The oxygen tank consists of one or two steel reservoirs holding one litre each and containing oxygen at 110 atmospheres. The exhausted flasks may be replaced with full ones or may be refilled in place. The newer forms of the apparatus permit the exhaled air still containing oxygen to pass two or three times to the lungs. The apparatus, though ingenious, is most complicated and is little employed in French mines.

The *pneumatogene* of M. M. Bamberger and Friedrich Bock is also a regenerative appliance. It is based upon the reactions that take place when the products of respiration are passed over the peroxide of sodium and potassium.

The early types permitted only 30 to 35 minutes stay in an irrespirable atmosphere; later types may be used for two and one half hours. They are generally used in Austria, but very little in France.

The Tissot respirator, invented in 1907 is one of the best conceived French apparatus of the type. Its five essential parts are:—

1. A nose-piece with valve, adjusted to the nostrils of the wearer by means of two nipples fixed on the tube, and attached firmly to a round cap by means of straps. A potash regenerator removes the carbonic acid; and the regenerated air passes to the reservoir bag.

2. A regenerator fixed on the case, which serves also for the protection of the gas bag.

3. A reservoir sack for the air, in which the regenerated products of repiration are accumulated.

4. An automatic safety or escape valve of the slide type, operated by the walls of this air reservoir.

5. A receiver for compressed oxygen provided with a reducer and a gauge by which a constant flow of oxygen is obtained and is regulated at will by the wearer.

The time limit of the Tissot respirator is three and a half hours. Since the apparatus is borne upon the chest the wearer may crawl upon his stomach without hindrance.

The Vaginot apparatus consists of three parts:

1. A battery of air accumulators.
2. An indicating reducing gauge.
3. A respiratory mask or helmet.

In construction it is simple, being put into operation by merely opening a stop-cock. A special arrangement permits the wearer to travel any distance without using the air supply stored in the battery. Another warns the operator when he has but fifteen or twenty minutes supply left. With a sufficient supply of reserve compressed air accumulators the rescue party may remain at work indefinitely. The apparatus is carried on the back.

The aerolith, or liquid-air respirator, on account of the costliness of liquid-air, is rarely employed.

PERSONAL AND GENERAL.

Mr. F. P. Jones is visiting various steel plants in the States.

Mr. H. E. T. Haultain is paying a professionl visit to Cobalt.

Dr. A. B. Willmott passed through Toronto on the 7th inst. on his way to Cobalt.

Mr. Charles D. Warren of Toronto has been elected president of the Lake Superior Corporation.

Mr. George Stairs, of Halifax, N. S., whose death occured suddenly last week, was a director of the Nova Scotia Steel Company.

Mr. J. H. Plummer, president of the Dominion Steel Company, arrived in New York on April 1st after a protracted visit to England.

Mr. Philip E. Clinton, a representative of the Guggenhiem interests was in Montreal recently investigating some Canadian mining propositions.

Prof. James W. Hayward, assistant professor of mechanical engineering at McGill University, Montreal, has resigned his position to devote himself to outside engineering work.

Dr. James Douglas, of New York, also is a graduate of Queens' University, Kingston, Ontario, has subscribed $10,000 towards the endowment fund of the School of Mining affiliated with the University.

Mr. G. Becker, Vice-President of the Northern Dredging Company of Chicago, which has a 15 mile gold dredging concession on Saskatchewan river near Edmonton, has arrived here to direct operations on the opening of the season.

A Fort William, Ontario, syndicate have secured 61 iron mining claims in a locality about 100 miles west of that city on the main line of the Canadian Pacific Railway. Test pit indicate that there is an extensive deposit of valuable iron ore.

Mr. R. Watson, an experienced mining man also has been associated with Mr. Wm. B. Thompson, of New York, in various enterprises has been elected general manager of the Nipissing Mining Company, in place of Mr. T. R. Drummond, resigned.

Mr. J. C. Dufresne, who lately resigned the position of mill-superintendent of the Bluebell mine near Kaslo, British Columbia, was presented with a gold watch by the employees of the Canada Metal Company. Mrs Dufresne, at the same time, was given a pendant.

Mr. Frank C. Loring, of Toronto, who is at present in London, England, was recently interviewed by a representative of "Canada." In his replies to interrogations Mr. Loring alludes to the elimination of "wild-cats" from Cobalt. He also speaks confidently of the future of the camp; especially when custom smelting rates have been adjusted to a sound commercial basis.

SPECIAL CORRESPONDENCE

Nova Scotia.

Glace Bay.

The weather during March has been of the mildest character and the supply of labour at the collieries more plentiful than for some time past. The result of this favourable combination is shown by the outputs, which exceed anything yet attained in the month of March. The outputs of the Dominion Coal Company's mines for the month of March in the last five years has been as follows:

1904	232,245
1905	228,765
1906	310,220
1907	212,831
1908	346,529

Compared with the first three months of 1907, the 1908 outputs so far show a gain of well over a quarter of a million tons, and it is expected if all goes well that by the end of the year the gain will amount to over 400,000 tons, and that the year's output for 1908 will be within 100,000 tons of 4,000,000 tons. As the entire Canadian coal output is between eight and nine million tons it will be seen how large a proportion of this comes from Cape Breton, when the outputs of the remaining island operators are added.

It is anticipated that shipments to the St. Lawrence will commence at the end of this week, or about the 5th of April. If this can be done the shipping season will commence practically six weeks earlier than in 1907, and unless some unforeseen hindrance takes place the St. Lawrence shipments this season will exceed any previous performances. The Dominion Coal Company have chartered a fine fleet of coal carriers, all of them self-trimmers and averaging between 6,500 and 7,000 tons cargo capacity. These boats are new and fast and it is hoped to make weekly round trips with them. Things were never in better shape for the shipping season's work than at present, and with all labour disputes satisfactorily adjusted we are confidently looking forward to an excellent showing for 1908.

The statement made by Mr. James Ross at the Annual General Meeting of the Dominion Coal Company in Montreal on the 5th of March has been printed in pamphlet form and distributed to the shareholders of the company. It has excited general interest in Nova Scotia and has created almost a revulsion of public opinion in favour of the Coal Company's contentions. The general sentiment of Nova Scotia has been up till now very strongly in favour of the Steel Company, but this sentiment or atmosphere one might term it, so all pervading was it last summer, was based very largely upon an industriously cultivated impression grounded on superficial facts that the Steel Company was the under dog and was being mercilessly worried by the Coal Company. This illusion has been dispelled by Mr. Ross's statement, which is a masterpiece of lucidity, coldly marshalling an array of damnatory facts that put the arbitrary actions of the Steel Company in a very poor light. In the light of events during the past three months it is difficult to understand the actions of the Steel Company, unless they were deliberately intended to embarrass the Coal Company. In the spring of 1906, the Steel Company, broke their promise under the *modus vivendi*, that they would make a bank. This year, fearing a strike of the Coal Company's miners, the Steel Company have managed to gather a bank of over 50,000 tons. The whole trouble between the Steel Company and the Coal Company in 1906 arose from the Steel Company's refusal to provide a bank in the spring months when labour was plentiful and the Coal Company's outlet restricted, coupled with the Steel Company's abrupt refusal to accept slack coal and their demand for run of mine at the very climax of the St. Lawrence season, that season by the way one that had been beset with most unusual difficulties. We may quote Mr. Ross here: "The Steel Company's course of action appeared to your directors to be wholly unreasonable. The slack, which it refused, it had been taking for a year, and had volunteered the statement that it was satisfactory. The run of mine, which it insisted on, it had to crush to the same size as the slack before it could use it. The Coal Company had slack, but could only get run of mine with great difficulty. The time chosen was the one at which such action would most embarrass your company. There was no advantage to the Steel Company to justify its action. There was, however, the possibility that such action taken at such time would embarrass your company that it might fail to deliver quantities and the Steel Company could then have closed its works at your risk and dictated terms." After summing up his position, Mr. Ross remarks: "I feel I hardly need to ask any of you what you would do under similar circumstances" and we think the most peacably minded of men might very well have made the same remark in similar circumstances. What other action the President of the Coal Company could have taken without betraying his company's shareholders it would be hard to say.

Remarkably good progress is being made at the new collieries of the Dominion Coal Company at Victoria. The building of 50 houses with a boarding hotel and a manager's house has been commenced and will be rapidly pushed. It would be difficult to find a more ideal location for a colliery than that of No. 12. The neighboring colliery is to be called No. 14. Even the Coal Company makes concessions to a superstition, and we suppose their so doing has a very real financial basis. Miners are a superstitious race. We have known many a man turn back from his work in the early morning because he met that harmless and necessary creation—a woman! However, that was not in Cape Breton.

The report of the Department of Mines of Nova Scotia ending 30th September 1907 is to hand, and is an interesting publication. There are few innovations over previous reports, but as yet the newly appointed Commissioner of Mines has not had time to make any very radical improvements. We prophesy that the report for 1908 will be a much fuller and better arranged publication than the one now before us. In the summarized figures on the first page we notice several items that do not appear in the 1906 column. One is building stone. It has often been a source of wonder to us that we have not more buildings in Nova Scotia of native stone. In Cape Breton alone we have a remarkable assortment of valuable and durable building stones. We have granite, marble of most excellent quality it is said, porphyry and syenite, limestone, sandstone, etc. The quarrying industry is one that is bound to grow as the forests become more and more depleted, and as the cities of the Dominion increase in wealth and dignity.

There are a number of spelling mistakes especially in proper and proprietory names which need revision. We notice "Janesville for Jeanesville, "Muesselar" for Meuseler" and several similar slips. An interesting feature of the Deputy Inspectors reports is the growth of the use of safety explosives in our mines. It would be interesting to have a better classification of accidents, and showing the chief divisions of accidents, such as gas, dust or powder explosions, falls of roof and sides, haulage accidents, etc. Not to be hypercritical it seems to us that an official report is hardly the place for personal enconiums even for "young men of natural ability and good training." Such remarks rather detract from the dignity that should attach the report of an Inspector of Mines. We must say the reports of the inspectors make good and interesting reading, and we think the report should be given a wide distribution among the colliery managers and underground officials. The photographs illustrating the report will materially increase its value as an advertisement of the provinces mineral resources, for which purpose we take it they were introduced. We notice also the flow sheet of the Dominion

Antimony Mine at West Gore. Specific information of this kind is very valuabe. Altogether we think the department is to be congratulated on its 1907 report and as we said before we shall be surprised if the 1908 volume is not an improvement on any of its predecessors.

Ontario.

Cobalt.

Nipissing.—Mr. T. R. Drummond, the manager, leaves on the 20th of this month for Utah, his resignation having been accepted. He will take charge of some properties there for some men who are also heavily interested in Nipissing. He will be succeeded here by Mr. R. B. Watson, late consulting engineer for the Shannon Copper Company of Arizona. Mr. Watson is also a director of the Nipissing. The annual meeting of the stockholders of the Nipissing Mines Company will be held on April 20th. The number of shareholders in Canada and the United States has nearly doubled within the last year. There are now 14,000 on the books.

Silver Leaf.—The shaft is down 115 feet. A carload of ore is ready for shipment and will be sent out early next week. This car should run up very well, as rich ore has been taken lately from the shaft.

Rothschild.—Work has been discontinued here for the present and the diamond drill plant moved to the Shamrock, where work will be carried on. This is being done by the Montreal Ventures Syndicate.

City of Cobalt.—A new departure in shipping was made here. Two carloads of low grade ore have been shipped to the smelter at Trail, B.C. A freight and treatment rate of $19.50 was obtained—$12 freight and $7.50 treatment.

Duchess.—A complete mining plant is to be installed here, and no more mining will be done until the installation is completed.

Ferland-Chambers.—Captain Jeffrey, formerly superintendent of La Rose mine, has a crew of men at work. A shaft will be sunk close to the Right of Way workings.

Crown Reserve.—Work has been started on the new shaft, which will be sunk to a depth of 100 feet and a cross-cut run to the vein. A new boiler, hoist and compressor will be installed. This company is capitalized at $2,000,000, of which $1,500,000 had been issued. The stock was selling at 28, when an issue of $250,000 more stock was made. The shares dropped to 6, but are now back at 23. The property is looking very well.

Little Nipissing.—Mr. Madden, the superintendent, has a carload of ore sacked and ready for shipment.

Abitibi Mining Company.—This company are putting in a plant and work will commence at once.

Kerr Lake (Jacobs Mine).—There were 8,600 ounces of metallics in a 30 ton car shipped from here to Copper Cliff this month.

Colonial.—After having been shut down for some months, this mine has started up again, and four drills are being run.

Green-Meehan.—Work is to be resumed here shortly.

Cleveland Cobalt.—Mining on this company's property at Clear Lake has been suspended. The power plant is still running, supplying power to the city of Cobalt mine and also the lighting for the town of Cobalt.

Badger.—The shaft is down 115 feet and ore carrying a quantity of native silver is being taken out.

Coniagas.—The mill is to be enlarged, so that instead of about 55 tons a day being run through as at present, the capacity will be 80 tons. A producer gas plant will be put in. Work is going on well with the new shaft house, which will be completed in the next week or so.

Right of Way.—Connections at the first level, between Nos. 1 and 2 shafts, has been made and the hoisting, etc., will now be all done at the No. 2.

Savage Mine.—Work has been stopped here until a new boiler is put in.

Wetlauffer.—Work has been stopped here until the boiler and hoist are installed.

Casey Cobalt.—This is a new shipper, 40,000 pounds being sent to Glasgow.

The smelter at Deloro, which has been running on ore from this camp, has made a shipment of bullion to England, worth between twenty-five and thirty thousand dollars.

Lorrain Township.

Some of the holders of large interests in the Nipissing have been trying to get hold of the Keeley claim. An offer of $225,000, the owner to keep ore now on dump, was made, but refused. There is $25,000 worth of ore now sacked, all taken from a pit seven feet long and twenty feet deep.

Native silver has been found on the Crawford claim, a mile and a half from here.

The other claims being work are showing up well. The roads in are in bad shape.

Montreal River.

Chas. Gifford has 40 sacks of high grade and as much more low grade ore ready for shipment.

High grade ore carrying native silver is being sacked on a claim in the Township of Smythe.

The White claims on Maple Mt. have been bonded to an English Syndicate for $150,000. Men have been sent in to cut roads and arrange for development.

Larder Lake.

Mr. Hough, the Recorder at Larder City, has brought down some very fine samples of gold-bearing quartz from the dump at the Maxwell-Harris mine. The gold can be seen all through it. Owing to poor fuel, not enough steam could be raised to keep the mill running, but dry wood is now being brought in. If it is found that this property and the Reddick have plenty of ore that can be mined and milled at a profit, it will mean that there will be much more development work going on in that district this summer than there would otherwise have been. From all accounts both these properties have plenty of ore that can be cheaply mined, so it depends upon the values and what can be saved.

The Reddick Company has been re-organized and work will be resumed shortly.

Dr. Beattie Nesbitt, of Toronto, has acquired control of the Barnard claim on Larder Lake.

A find of placer gold has been reported on the Nottingham river up north, and some parties have been sent out to investigate.

British Columbia.

Rossland.

Owing to the increased quantity of gold that is now being carried in Rossland ore the Trail smelter has just been able to send away the richest car of matte that they have ever shipped. The car, which was sent to the Tacoma refinery, was valued at over $32,000, and the matte carried 41 per cent. copper, 35 ounces silver and 45 ounces gold per ton. The Consolidated Mines will increase their shipments about 100 tons per day in the near future, bringing their daily tonnage up to about 550 tons per day. Development in the gold-bearing ore recently uncovered at depth in the Le Roi and Consolidated mines is giving gratifying results. Mining men here seem to consider the discovery of this good ore at depth an indication of the approach to the rich zone which prominent mining engineers have said would eventually be encountered in the lower levels of the camp. Several more South

Belt claims have been leased, including the Nest Egg and Mayflower. The Blue Bird lessees are still working in good ore. It is stated that the Blue Bird Company may buy the lease back and work the property themselves on a larger scale than the lessees are now operating. A large number of the properties that have lain idle will be worked on leases this coming season; while some of them may encounter good ore and continue to work, there is little doubt but the most of the lessees will give the thing up as a hopeless task after they have worked a while without obtaining any results.

Shipments from the camp for the week ended March 28th were:

	Week.	Year.
Centre Star	3,220	42,638
Le Roi	1,960	22,054
Le Roi Two	350	7,928
Evening Star	31	387
California-Giant	....	60
Totals	5,561	73,067

A $30,000 steel furnace is to be added to the smelter equipment at Trail. A number of the old, lapsed claims hereabouts are being re-staked, mostly in a speculative way.

Boundary.

Work is continued at high pressure at the Granby mines and smelter in the Boundary. During the week ended March 21st they shipped 25,388 tons, which was a larger week than any previous one in their history, and then for the week ending March 28th they shipped 27,288 tons, the heaviest shipments in the history of the mine. The totals for the year to date are: 246,796 tons mined and 239,587 tons smelted.

One day recently the company shipped 4,048 tons from its mines in 24 hours. Each of the furnaces have been treating 428 tons daily, which is working them to the very limit of their capacity. The Granby shipments during March touched the 100,000 ton mark, this being the greatest tonnage ever got out of the mine in its history, or, in fact, in the history of any copper mine in Canada. It is hardly expected that April will be as big a month as there are several improvements to be made around the plant which will take up eight or ten days' time. The coke and ore bins at the smelter have been enlarged, making it much easier to handle these products.

Boundary mining men hardly expect now that copper will take any great rise for some time. Owing to the heavy fixed charges at the Granby mines and smelter they deem it advisable and more profitable to work, even with copper at its present low figure, than remain idle. These charges may be the cause of some of the other Boundary companies resuming, if copper remains down for some time. It was rumored in this district last week that the Consolidated Company would absorb the British Columbia Copper & Dominion Copper companies. This report is denied by Mr. Keffer, of the British Columbia Copper Company, who states that his company will start their mines and plant up in their own interest just as soon as the copper values warrant such action. The Granby, Snowshoe, Sally and Crescent are the only mines that have shipped from the Boundary so far this year. A five stamp mill is now being installed at the Golden Zone mine, near Hedley.

The Provincial Government will not permit the City of Greenwood to issue bonds for $50,000 to bonus the tunnel scheme proposed at that point, which places another obstacle in the way of the promoters. Work on the E. P. U. is being carried on by a Greenwood-Phoenix syndicate. The British Columbia Copper Company has placed an order for eight 30 ton slag pots, which will be installed and ready for work when they start up. These pots will weigh eight tons each. The Providence Company has placed $50,000 worth of its 5 per cent. gold bonds. The money derived from the sale of these bonds will be put into development work. Phoenix men have begun development work on a group of five claims which adjoin the Oro Denoro in Summit Camp. The showing at present on these claims warrants a little exploration work.

Nelson.

A delegate from Nelson recently visited the principal towns in Alberta in an effort to get them to aid in the work of obtaining a renewal of the bonus on lead mined in Canada. As a result of his trip the boards of trade of Edmonton, Strathcona, Wetaskiwin, Calgary, Medicine Hat(Lethbridge and Red Deer have endorsed the petition of the Slocan lead miners and have forwarded resolutions to the Government at Ottawa along these lines. It looks as though the Slocan people would get their way, if hard work and pertinacity will gain them their end.

It is now known that the cause of the close-down of the Hall Mining & Smelting Company was the loss that was being incurred at the smelter. During 18 months' operation the Silver King mine produced a profit of $30,000 and the Emma made about $15,000, but all of this was converted into a loss of $24,000 at the smelter. This was no doubt mostly caused by lack of modern facilities, but part of its was due to mismanagement.

The hopes of the Slocan miners who have quantities of zinc in their ore are all hanging on the zinc smelter, now about completed. The process (electric) being installed has been successfully tried on the continent, and should prove satisfactory here if properly worked.

The new company that has taken over the affairs of the Ymir mine are said to have sufficient funds to do the work that is necessary to place the Ymir mine in the position it should be in. Development work and lots of it will have to be done, and it is stated that the men now in charge are in a position to do this work vigorously.

Spokane men have staked placer claims on the Columbia river at its confluence with the Pend d'Oreille. The company will purchase a dredge and work it on these claims. They should be able to locate gold with their dredge, as it was found in quantities on on the benchland in the early days.

Slocan—E. Kootenay.

The property of the Sullivan Group Mining Company is in the hands of the sheriff. The Crow's Nest Pass Coal Company has taken action to collect a bill of $7,000 for coke, and the employees of the mine and smelter have filed liens for $20,000 for their January and February wages. A. I. Goodell has entered proceedings for $10,000 for alleged breach of contract. The company has levied an assessment of 7 cents per share, which is necessary to clear up the present indebtedness of $50,000 and the outstanding bonds, amounting to $225,000. The assets of the company are its smelter, valued at $500,000, and the mine, with 150,000 tons of ore blocked out, which will average 15 per cent. lead and 6 1-2 ounces silver. It is stated that at the annual meeting some of the clouds were cleared away and that work will be resumed in a short while.

Thirty men are now employed at the Hewitt. The small tram has been conencted up to the main one. They have a considerable quantity of low grade ore in sight. Work will be resumed on the Alpha early this month. The assets of the Pioneer Mining Company, owning the Black Prince, Bank of England and other claims, have been sold to a syndicate of Nelson men, headed by C. Bell of that city. They have located a body of hard iron oxide ore in the old upper workings of the North Star. This ore is shot through with native silver. It is to be regretted that they have not opened up this ore in the lower workings of the Star. The Victor-Silver Leaf group, near Fort Steele, owned by Spokane people, is showing up well under development work. Iron pyrites in the ore carry from $10 to $12.60 in gold. The Great Northern Railway has promulgated a new rate on coal, by way of the Fernie-

Michel extension to points in Idaho and Washington, of $2.25 per ton. This rate is twenty-five cents lower than the old one.

Coast, Etc.

Ore that carries from $60 to $100 in copper is being taken out of the Ikeda mines by the Japanese owners. Obout 20 tons per day is being mined at the present time, but orders have been placed for an addition to the plant, and when the new machinery is installed the output will average 50 tons per day. The Treadwell Gold Mining Company is having trouble with its employees, and it has been found necessary to send troops to Treadwell as a measure presentative to violence.

GENERAL MINING NEWS

NOVA SCOTIA.

Sydney.—The Dominion Coal Company's shipping fleet this year numbers sixteen steamers, six of which are owned by the Company, the balance being charter boats, most of the latter being big vessels, over 6,000 tons. The list is as follows, with capacity tonnage:

	Tons.
Owned by company—	
Bonavista	1,200
Cabot	440
Cacouna	1,750
Cape Breton	2,250
Coban	1,200
Louisburg	2,200
Chartered steamers—	
Borgestad	6,600
Dominion	5,650
Fornebo	6,000
Kron Prinz Olav	6,600
Mystic	5,600
Catalone	5,700
Stigstad	6,600
Tanke	800
Ocean	6,600

The first sailings of coal steamers for the St. Lawrence during the last seven years have been as follows:

1901 Louisburg	April 22
1902 Alderney	April 14
1903 Alderney	April 15
1904 Britanica	April 20
1905 Britanica	April 22
1906 Scottish Hero	April 17
1907 Fornebo	April 18

Operations at the site of the Dominion Iron & Steel Company's coal areas, near Port Morien, have been practically suspended for a short time. For the past few months a party of over 40 was engaged in boring for a new slope and drilling at the site, and excellent progress was made. A sufficient quantity of coal of excellent quality was mined to run the engines and drills, and was extracted with little difficulty. A sufficient staff has been retained at the areas drilling and keep the engines running.

ONTARIO.

Ottawa.—The first instalment of coin turned out from the Canadian Royal Mint at Ottawa was distributed on April 2nd. A total of $24,000 was sent to various parts of the country.

The coins were all denominations, and an equal quantiy, so far as value was concerned, of each class, was sent out.

There were twelve thousand 50-cent pieces, 24,000 25-cent pieces, 60,000 10-cent pieces, and 120,000 5-cent pieces, making $6,000 worth of each demonination.

The money was shipped by Dominion Express to the receivers-general in Toronto, Montreal, Vancouver, an dother cities, who will deal the coins out as they are applied for.

Deloro.—From the reduction works of the Deloro Mining & Smelting Company more than eight tons of silver bullion have already been shipped.
